VOLUME XIX
MEYER—NAVAL RANK

MEYER, mī'ēr, Adolf, American psychiatrist: b. Niederweningen, Switzerland, Sept. 13, 1866; d. Baltimore, Maryland, March 17, 1950. He was educated at the universities of Zürich, Paris, London, Edinburgh, and Berlin, and came to the United States in 1892.

He was honorary fellow and docent at the University of Chicago (1892-1895), and pathologist to the Eastern Hospital for the Insane at Kankakee, Illinois (1893-1895). He was pathologist and later director of the clinical and laboratory work at the Worcester, Mass., Insane Hospital, and docent in psychiatry at Clark University (1895-1902). He was director of the Pathological Institute at the New York State hospitals from 1902 to 1910, and professor of psychiatry at the Cornell University Medical College from 1904 to 1909. From 1910 to 1941 he was professor of psychiatry at Johns Hopkins University, and director of the Henry Phipps Psychiatric Clinic at Johns Hopkins Hospital. He was emeritus professor at Johns Hopkins University from 1941. He was the first person to use the term "mental hygiene," and he wrote many scientific papers on the subject.

MEYER, Adolf Bernhard, German zoologist and anthropologist: b. Hamburg, Germany, Oct. 11, 1840; d. Dresden, Germany, Feb. 5, 1911. He was educated at the universities of Göttingen, Vienna, Zürich, and Berlin. Later he made explorations in the Malays and in the Philippines. He was director of the Royal Museum of Natural History at Dresden from 1874 until his retirement in 1905.

He was author of *Die Hirschgeweihsammlung zu Moritzburg* (1883-1887); *Album von Philippinentypen* (1885-1904); *Album von Papuatypen* (1894-1900); and *Amerikamsche Bibliotheken und ihre Bestrebungen* (1906).

MEYER, Annie Nathan, American dramatist, author, and educator: b. New York, New York, Feb. 19, 1867; d. there, Sept. 23, 1951. Educated at home, she took examinations at Columbia University (women not then being admitted), and was one of the founders of Barnard College (women's department of Columbia University). She was active as a lecturer and publicist, and was a member of the Authors League of America, and the Dramatists Guild.

Her publications include *Woman's Work in America* (1891); *Helen Brent, M.D.* (1893); *The Dominant Sex*, a play (1911); *The District Attorney*, a play (1920); *The Advertising of Kate*, a play (1921); *Black Souls*, a play (1932); *Barnard Beginnings* (1935); and *It's Been Fun* (published posthumously, 1951).

MEYER, Balthasar Henry, American economist: b. Mequon, Wisconsin, May 28, 1866. He was graduated at the University of Wisconsin in 1894, and later studied at Berlin. He was connected with the staff of the University of Wisconsin from 1895, and was professor of political economy there from 1900 to 1910. In 1905 he was appointed a member of the Railroad Commission of Wisconsin, and from 1907 until 1911 served as its chairman. President Taft appointed him to the United States Railroad Securities Commission in 1910, and to the Interstate Commerce Commission in 1911.

He was author of *Railway Legislation in the United States* (1903); and *History of Transportation in the United States before 1860* (1917); *Some Accounting Problems under the Transportation Act* (1921).

MEYER, Conrad Ferdinand (called himself MEYER-ZIEGLER), Swiss novelist and poet: b. Zurich, Switzerland, Oct. 11, 1825; d. Kilchberg, Switzerland, Nov. 28, 1898. He devoted himself in his earlier years chiefly to studies in history and art. The two historians who influenced Meyer particularly were Louis Vulliemin at Lausanne and Jakob Burckhardt at Bâle whose book, *Die Kultur der Renaissance in Italien* (1860), stimulated his imagination and interest. From his travels in France and Italy (1857) Meyer derived likewise much inspiration for the settings and characters of his historical novels. His mind matured slowly and it was not until the Franco-Prussian War in 1870 that he found himself and his genius. In Meyer's novels a great crisis will often release latent energies and precipitate a catastrophe. In the same manner his own life, which so far had been one of dreaming and experimenting, was stirred to the very depths by the events of 1870. Meyer identified himself with the German cause and as a manifesto of his sympathies published the little epic, *Huttens Letzte Tage*, in 1871. The following two decades from 1870 to 1890 were the years of harvesting and brought to light a number of historical novels and tales.

Meyer's works include six long and five shorter historical tales, two short epic poems, and a volume of lyrics, among them some ballads of exceptional merit. The periods of the Renaissance and Counter-Reformation furnished the subjects for most of his novels in which the aesthetic charm of a picturesque setting is combined with keen psychological analysis.

Jürg Jenatsch (1876) describes the political plots and intrigues in which the Swiss canton, Graubünden, became involved during the Thirty Years' War through the conflict between Spain and Austria, and France. *Der Hailig* (1880)

tells the story of Thomas à Becket of Canterbury. *Die Richierin* (1885) introduces Charlemagne and his palace school.

Among Meyer's shorter stories may be singled out *Gustav Adolf's Page* (1882), and *Plautus in Nonnenkloster* (1882) as two gems of his inimitable art. As a psychologist and interpreter of enigmatic characters Meyer has few equals in the field of the historical novel.

EWALD A. BOUCKE,
Former Professor of German, University of Michigan.

Bibliography.—Langmesser, A., C. F. Meyer (Berlin 1905); Frey, A., *Meyer: sein Leben und seine Werke* (Stuttgart 1909); Korrodi, E., C. F. Meyer: *Studien* (Leipzig 1912); Burkhard, A., *Conrad Ferdinand Meyer, the style and the man* (Cambridge, Mass., 1932); Bang, C. K., *Maske und gericht in den werken Conrad Ferdinand Meyer* (Baltimore, Md., 1940).

MEYER, Eduard, German historian: b. Hamburg, Germany, Jan. 25, 1855, d. Berlin, Germany, Aug. 31, 1930. He was educated at Bonn and Leipzig, and after completing his studies spent one year in Constantinople (Istanbul). In 1879 he went to the University of Leipzig as privatdocent; in 1885 he became professor of ancient history at Breslau; in 1889 at Halle; and in 1902 at Berlin. His original methods of teaching ancient history were highly acclaimed, and he received honorary degrees from Oxford, St. Andrews, and Freiburg universities.

Among his works are *Geschichte des Altertums*, 5 vols. (1884–1902), *Geschichte des Alten Aegyptens* (1887); *Forschungen zur alten Geschichte* (1892–1899); *Die Wirtschaftliche Entwicklung des Altertums* (1895); *Die Entstehung des Judentums* (1896); *Zur Theorie und Methodik der Geschichte* (1902); *England* (1915); *Ursprung und Anfänge des Christentums*, 3 vols. (1920–1922); and *Die Entwicklung des Judentums und Jesus von Nazareth* (1921).

MEYER, George von Lengerke, American cabinet officer and diplomat: b. Boston, Massachusetts, June 24, 1858; d. March 9, 1918. He was graduated at Harvard in 1879, and engaged in business as merchant and trustee in 1879–1899. He was a director of various trust companies, banks, manufacturing companies, and public utilities concerns, and was a member of the Boston Common Council, 1889–1890. He served in the Massachusetts House of Representatives in 1892–1896, acting as speaker in 1893–1896, and was a member of the Republican National Committee in 1898–1904. He was ambassador extraordinary and plenipotentiary to Italy in 1900–1905, and to Russia in 1905–1906. He served as postmaster general under President Roosevelt in 1907–1909, and in the Taft administration he was secretary of the navy (1909–1913).

MEYER, Hans, German explorer and publisher: b. Hildburghausen, Germany, March 22, 1858; d. Leipzig, Germany, July 5, 1929. He was educated at Leipzig, Berlin, and Strasbourg, afterward travelling in India, North America and South Africa, and subsequently visiting East Africa and South America. He entered the publishing house of his father, the Bibliographischen Institute at Leipzig in 1884, and in the following year became one of the directors of the firm; but at intervals he continued his exploring expe-

ditions. Among his explorations were the ascent and survey of the summit of Kilbo Peak in East Africa in 1889 and 1898; and the Ecuadorian Cordilleras in 1903.

He was author of *Zum Schneedom des Kilimandscharo* (1888); *Der Kilimandscharo* (1900); *Die Eisenbahnen im tropischen Afrika* (1902); *In den Hochanden von Ecuador* (1907); *Die Barundi* (1916); and *Das portugiesische Kolonialreich* (1918); *Morphologie der Visungavulkane* (1927).

MEYER, Heinrich August Wilhelm, German Biblical commentator and theologian: b. Gotha, Germany, Jan. 10, 1800; d. Hannover, Germany, June 21, 1873. He studied at Jena, was pastor at Harste, Hoya and Neustadt, and upon his retirement in 1848, settled in Hannover. He is remembered for his *Commentaries on the New Testament*, in 16 volumes, begun in 1832 and completed in 1859.

MEYER, Henry Herman, American Methodist Episcopal clergyman, editor, and educator: b. Champaign, Illinois, Nov. 21, 1874; d. Brooklyn, New York, Oct. 6, 1951. He was educated at Baldwin Wallace College, Berea, Ohio; Drew Theological Seminary; Teachers' College, Columbia University; and at Yale University. He was ordained in the ministry in 1900, and filled pastorates in Wilmington, Calif., and Mount Vernon, N. Y. He was professor of St. Paul's College, Minnesota, 1900–1901; in 1903 he became assistant editor of the Methodist Episcopal Sunday School publications, and in 1914 he was appointed editor of those publications. In 1929 he became dean of Boston University's School of Religious and Social Work, retaining that position until 1942 when he became dean emeritus. After his retirement he was visiting lecturer at Nanking Theological Seminary, Yenching University, and West China Union University, China.

He was a member of the executive council of the Religious Education Association, the executive committee of the World's Sunday School Association, and a member of the American Association for Adult Education, the International Council of Religious Education, and the National Conference of Social Work.

He was author of *The Lesson Handbook* (annual 1904–1927); *The Graded Sunday School in Principle and Practice* (1910); *Cooperation in Christian Education* (1917); and *Child Nature and Nurture according to Count Nicholas Ludwig von Zinzendorf* (1928). He also contributed articles to various religious educational periodicals.

MEYER, Hugo Richard, American author and economist: b. Cincinnati, Ohio, April 1, 1866. He was graduated at Harvard in 1892, and attended the Harvard Graduate School from 1892 to 1896. He was instructor in political economy at Harvard from 1897 to 1903, and was assistant professor in political economy at the University of Chicago from 1904 to 1905. In 1907 he was engaged at Melbourne in preparation of a history of state ownership in Victoria, Australia.

He has written *Government Regulation of Railroad Rates* (1905); *Municipal Ownership in Great Britain* (1906), and related works including *The British State Telegraphs* (1907);

'Public Ownership and the Telephone in Great Britain' (1907).

MEYER, Johann Georg, commonly known as "Meyer von Bremen," German painter: b. Bremen, 28 Oct. 1813; d. Berlin, 4 Dec. 1886. In his 21st year he went to Düsseldorf and began his studies under Sohn and Schadow; in 1841 he opened a studio of his own but removed to Berlin as his fame increased (1853). While scenes from the Bible were first the subjects of his brush, he later turned his attention to incidents of popular life, especially among the Hessian peasantry, and finally to the portrayal of family life in its pathetic aspect. Such pictures as 'The Jubilee of a Hessian Pastor' (1843); 'Christmas Eve'; 'Blindman's Buff'; 'The Soldier's Return'; 'The Inundation' (1846); 'The Repentant Daughter' (1852, in the gallery at Bremen), are full of intense sympathy with the "simple annals of the poor." After taking up his residence at Berlin, he chose especially scenes from child life, which he rendered with spirited humor. Among his pictures of this kind are 'The Fairy Tale'; 'Children Playing Blindman's Buff'; 'Grandfather and Grandchild,' etc. A third group of his pictures includes those of young women, as single figures or in groups. Such are 'The Tryst'; 'The Love Letter.' An excellent example of his work, 'The Letter' (1873), is in the Metropolitan Museum, New York. All his works are distinguished by true human feeling, truthfulness and thoroughness of execution.

MEYER, Joseph, German publisher: b. Gotha, 9 May 1796; d. 27 June 1856. He organized various industrial undertakings, founded a publishing business at Gotha, which soon attained large proportions, was removed by him to Hildburghausen (1828), and in 1874 was transferred to Leipzig. The best known of his publications is the 'Meyers Konversationslexikon,' the rival of Brockhaus in the encyclopædia field, which has been brought down to date by constant revisions and supplements. He published also a series of the German Classics, a 'Historical Library,' and a 'Library of Natural Philosophy.'

MEYER, Kuno, German Celtic scholar: b. Hamburg, 20 Dec. 1858. He was educated at the Gelehrtenschule of the Johanneum, Hamburg, and at the University of Leipzig. In 1884-95 he was lecturer, and in 1895-1915, professor of Teutonic languages at University College, Liverpool; and from 1911 he was professor of Celtic at the University of Berlin. He founded the *Zeitschrift für Celtische Philologie* in 1895, and with Whitley Stokes founded the *Archiv für Celtische Lexikographie* in 1898. He founded the School of Irish Learning at Dublin in 1903. He was a member of the Royal Prussian Academy. His pro-German sympathies brought him into disfavor in England and Ireland after the outbreak of the European War. Author of 'Eine irische Version der "Alexandersage"' (1883); 'The Irish Odyssey' (1885); 'The Vision of MacConglinne' (1892); 'Early Relations of the Brython and Gael' (1896); 'Liadain and Curithir' (1902); 'Ancient Irish Poetry' (1911), etc. He died in 1919.

MEYER, Lothar Julius, German chemist: b. Varel, Oldenburg, 19 Aug. 1830; d. Tübingen, 11 April 1895. He studied medicine at Zürich

and Würzburg and later specialised in physiological chemistry at Heidelberg, and in mathematical physics at Königsberg. He became privatdocent in physics and chemistry at Breslau in 1859, taught in the School of Forestry at Neustadt-Eberswalde in 1866-68, and at the Karlsruhe Polytechnic in 1868-76; and from 1876 he was professor of chemistry at Tübingen. He is known for his theory of the action of carbon monoxide on the blood; and for his work in the periodic classification of the elements. Author of 'Die modernen Theorien der Chemie' (1896); 'Die Stomgewichte der Elemente aus den Originalzahlen neu berechnet' (1883); 'Grundzüge der theoretischen Chemie' (1902).

MEYER, [Marie] Paul Hyacinthe, French philologist: b. Paris, 17 Jan. 1840; d. 19 March 1917. He was educated at the Lycée Louis le Grand and at the École des Chartes, specializing in the Romance languages. He was attached to the manuscript department of the Bibliothèque Nationale in 1863-65, and in 1865 founded the *Revue Critique*. He was keeper of the national archives in 1866-72 and in 1872 founded *Romania*, to which he was the leading contributor. He was appointed professor of the languages and literatures of southern Europe at the College of France in 1876, and from 1882 he was a director of the École Nationale des Chartes. He became honorary professor at the College of France in 1906. His work in connection with romance literature is of exceptional value and he is considered the leading modern authority on the French language. He was a member of the Institute of France, a commander in the Legion of Honor and an associate of the British Academy. He edited a large number of old French texts, many of which were for the Société de l'histoire de France and the Société des anciens textes français. Among them are 'Aye d'Avignon' (1861); 'Flamenga' (1865); 'Histoire Guillaume le Maréchal, comte de Striguil et de Pembroke' (3 vols., 1891-1901); 'Fragments d'une vie de Saint Thomas de Cantorbéry' (1885), etc. Author of 'Rapports sur les documents manuscrits de l'ancienne littérature de la France conservés dans les bibliothèques de la Grande Bretagne' (1871); 'Recueil d'anciens textes bas-Latins, provençaux et français' (2 parts, 1874-76); 'Alexandre le Grand dans la littérature française du moyen âge' (2 vols., 1886); 'Histoire des relations de la France avec Venise' (1896); 'Documents linguistiques du midi de la France' (1909), etc.

MEYER, Victor, German chemist: b. Berlin, 8 Sept. 1848; d. Heidelberg, 8 Aug. 1897. He studied at the University of Berlin and under Bunsen at Heidelberg. In 1868 he entered the laboratory of Baeyer at Berlin, and in 1871 he became professor at the Stuttgart Polytechnic. He was professor of chemistry and director of the laboratory at Zürich in 1872-85, professor at Göttingen in 1885-89, and from 1889 until his death he occupied the chair of his former master, Bunsen, at Heidelberg. He is famous for his experiments establishing a method of determining vapor densities and for the discovery of thiophen. He was awarded the Davy medal of the Royal Society in 1891. Author of 'Die Thiophengruppe' (1888); 'Chemische Probleme der Gegenwart' (1890);

'*Lehrbuch der organischen Chemie*' (2 vols., 1891-92); 'Märztage im Kanarischen Archipel' (1893), etc.

MEYER-HELMUND, Erik, Russian-German composer: b. Petrograd, 25 April 1861. He studied in Berlin and became known as a composer of appealing songs, for many of which he wrote both words and music. Author of the operas 'Margitta' (1889); 'Der Liebeskampf' (1892); 'Heines Traumbilder' (1912); the burlesques 'Trischka' (1894); 'Lucullus' (1905), and the light opera 'Taglioni' (1912).

MEYER-LUBKE, Wilhelm, German-Swiss philologist: b. Dülendorf, Switzerland, 30 Jan. 1861. He was educated at the universities of Zürich and Berlin, and in 1887 became professor at Jena. He was appointed professor of Romance philology at Vienna in 1890, serving as rector in 1906-07. Author of 'Grammatik der romanischen Sprachen' (4 vols., 1890-1905); 'Italienische Grammatik' (1891); 'Einführung in das Studium der romanischen Sprachwissenschaft' (1901); 'Historische Grammatik der französischen Sprache' (1908); 'Katalonische Deutsch' (1925).

MEYERBEER, mi'ë-bär, Giacomo (Italianized form of Jakob Meyer Beer), German composer: b. Berlin, 5 Sept. 1791; d. Paris, 2 May 1864. His father, Jakob Beer, was a rich banker of Jewish descent, and of high reputation in the commercial world. The son gave early proof of his devotion to the art of music, and at nine was regarded as a masterly pianist in a city famous for its excellent musicians. After studying composition under Bernhard Anselm Weber, he entered in 1810 the school of the Abbé Vogler at Darmstadt, where for three years he had the companionship of Karl Maria von Weber (q.v.). An intimate friendship sprang up between them, which was only interrupted by the death of the latter. While at Darmstadt Meyerbeer composed a cantata, 'Gott und die Natur,' which brought him the appointment of court musician to the grand-duke. In 1811 his opera 'Jephthas Gelübde' was produced at Munich, but failed to please the audience, though highly praised by Weber, Vogler and other musical authorities. Discouraged by its public reception, Meyerbeer went to Vienna, where he made his début as a pianist with such success that he seemed destined to eclipse the fame of all contemporary artists. Commissioned by the court of Vienna he produced 'Alimelek, oder die beiden Kalifen,' which was no more successful than his former effort. He was induced to visit Italy, and became a convert to the new musical school of that country. He rapidly composed in this style a series of operas, which were generally well received: 'Romilda e Costanza' (1818); 'Semiramide riconosciuta' (1819); 'Emma di Resburgo' (1819); 'Margherita d'Anjo' (1820); 'L'Esule di Granata' (1822); and 'Il crociato in Egitto' (1824). The success of the last-mentioned opera traveled beyond the Alps, and the composer was invited to Paris to superintend the preparations for the production of the 'Crociato' at the Grand Opéra, where it met with an enthusiastic reception. In 1831 his 'Robert le Diable' was produced for the first time, and the excitement it caused was perhaps unparalleled on the Parisian stage. Meyerbeer had ceased to be a

pupil of Rossini, and 'Robert' combined in a singular degree oriental gorgeousness, German massiveness, French vivacity and Italian brilliancy, which the preceding works of the composer had not prepared the world to expect. He reached the climax of his fame by his next opera, 'Les Huguenots' (1836). He was appointed Royal music director at Berlin in 1842, and returned to Paris in 1849. 'Les Huguenots' was followed at long intervals by 'Le Prophète' (1849); 'Pierre le Grand' ('L'Etoile du Nord' 1854); 'Le Pardon de Ploërmel' ('Dinorah' 1858); and 'L'Africaine' (1865). The composer did not live to see the production of his last work. Besides his operas he wrote many songs, an oratorio, cantatas, a Te Deum, music for the tragedy of 'Struensee' by his brother, and other works. Consult De Curzon, H., 'Meyerbeer: biographie critique' (1910); De Bury, 'Meyerbeer, sa vie ses œuvres et son temps' (1865); Hervey, A., 'Meyerbeer' (1913); Mendel, 'Giacomo Meyerbeer, eine biographie' (1868); Pougin, 'Meyerbeer' (1864).

MEYERHEIM, Friedrich Eduard, frëd'-rîh ed'oo-ard mi'ë-him, German artist: b. Dantzig, 7 Jan. 1808; d. Berlin, 18 Jan. 1879. He studied landscape painting in his native town, and in his 22d year went to Berlin, where he attended the Academy and fell under the influence of Schadow. He became a member of the Berlin Academy in 1838, and a professor there in 1850. Ten lithographic views of Dantzig, published by him in 1832, were included in his 'Architektonische Denkmäler der Altmark Brandenburg,' which appeared the following year. Between 1833 and 1841 he produced a number of genres with a romantic motif as illustrative of peasant and bourgeois life. Of such a character is 'The Champion Shot' (1836) in the Berlin National Gallery. In his search for character, costume, scenery and incident he traveled, studied and sketched over a wide area of territory, which included Westphalia, Altenburg, Thuringia, Hesse and the Harz district. His admirable genres are distinguished by a clear enamel-like coloring. Amongst the most notable are 'Leaving Church in Altenburg'; 'In an Altenburg Cornfield'; 'The Little Kid' (1842); 'Bedfellows' (1844); his masterpiece, 'Waiting' (1845); and 'Good Morning, Dear Father' (1858). Consult his 'Autobiography' (1880).

MEYERHEIM, Paul, German painter: b. Berlin, 13 July 1842; d. 1915. He was a son of Friedrich Eduard Meyerheim and was taught by his father, and afterward studied at the Berlin Academy. Travel through Belgium and Holland enlarged his artistic experience and knowledge, and he afterward spent a year at Paris. He then returned to Berlin, where he applied himself to animal painting, but also did some portrait, genre of common life, humorous scenes, still life, interior decoration of buildings, etc. He executed works both in oil and watercolors, and his versatility was only equalled by his delicate sense of color and brilliant technique. Considering all these qualities his fertility must be called extraordinary. Some of his best works are 'History of the Locomotive in Seven Pictures on Copper' (Villa Borsig, Berlin); 'An Antiquary of Amsterdam' (1869); 'Four Seasons in the Life of a Bird';

In the Menagerie; Portrait of His Father and Daniel Chodowiecki; The Theatre of Monkeys; The Hare and the Frog.

In 1863 he undertook a journey into Egypt from which he brought back many landscape and figure studies. He was a Royal professor and was awarded grand gold medals at Berlin and Munich.

MEYERHOF, mī'ēr-hōf, **Otto**, German physiologist: b. Hannover, Germany, April 14, 1884. He was professor at Kiel (1918-1924); he joined the Kaiser Wilhelm Institute for Biology in Berlin-Dahlem in 1924, and five years later became the director of the Department of Physiology of the Kaiser Wilhelm Institute for Medical Research at Heidelberg. He investigated carbohydrate metabolism, enzyme chemistry, thermodynamics, and biological assay, and was awarded the Nobel Prize (with Archibald V. Hill) in 1922 for his study of cellular oxidation and for the discovery of the transformation of lactic acid in the muscles. In 1938-1940 he worked at the Institute of Biology in Paris, and subsequently continued his research activities at the School of Medicine of the University of Pennsylvania.

MEYERHOLD, mī'ēr-hōlt, **Vsevolod Emilevich**, Russian theatrical director and producer: b. Penza, Russia, Jan. 28, 1874. Although he attained success and recognition during the czarist regime, after the revolution he became a member of the Communist Party. He began his career as an actor of the Moscow Theater of Art under the guidance of such famous masters of the true-to-life staging as K. S. Stanislavsky and V. I. Nemirovsky-Danchenko. After a trip to Italy in 1902 he founded the Theater of New Drama; in 1906 he became the director of a theater in St. Petersburg (now Leningrad); subsequently he took over the direction of a theater in Moscow bearing his name.

Meyerhold's earlier stagings were strongly naturalistic, but later he made such radical changes in presenting plays as the discarding of the curtain, the keeping the stage bare or provided only with purely formal, symbolistic scenery—a style imitated by modern theaters all over the world. He is author of *The Theater* (St. Petersburg 1913) and *Reconstruction of the Theater* (Moscow 1930).

MEYERSDALE, mī'ēr-z-dāl, borough, Pennsylvania, in Somerset County, 18 miles northwest of Cumberland, Md., and 113 miles southeast of Pittsburgh; altitude 2,054 feet. It is served by the Baltimore and Ohio, and Western Maryland railroads. Industries include the manufacture of cement, fertilizer, feed, and clothing. Diversified farming and coal mining are carried on nearby. It was incorporated as Dale City in 1870, the name being changed in 1874. Pop. (1950) 3,137.

MEYNELL, mēn'ī, **Alice Thompson**, English poet: b. Barnes, Surrey, Eng., Sept. 22, 1847; d. London, Nov. 27, 1922. She spent much of her childhood in Italy, and in about 1872 became a Catholic. She married in 1877 Wilfrid Meynell by whom she had eight children, and with whom she founded and edited the Catholic papers *Weekly Register* (1883-1895) and *Merry England* (1881-1898). Their home was a center

of literary life of the Catholic intelligentsia. In 1901-1902 she lectured in the United States on Charles Dickens, the Brontë sisters and on poets of the 17th century.

Mrs. Meynell's early volume of poems *Preludes* (1875) was illustrated by her sister Elizabeth, Lady Butler, well-known as a painter. It reveals the same delicate sentiments, the same mystic searching for the unseen world of the soul, that characterize the poems of her idols, Elizabeth Barrett Browning and Christina Rossetti. She published essays in *The Rhythm of Life* (1893), *The Colour of Life* (1896), *The Children* (1897) and *John Ruskin* (1900); then the whole harvest of a life rich in beauty and faith was presented in *Collected Poems* (1913) and *Essays* (1914). Consult also *Alice Meynell, a Memoir* (London 1929) written by her daughter Viola Meynell Dallyn.

MEYRINK, mī'rīngk, **Gustav**, German writer: b. Vienna, Austria, June 19, 1868; d. Starnberg, Bavaria, Germany, Dec. 7, 1932. He was a banker in Prague, Bohemia, but abandoned his profession to dedicate himself to writing. Joining the staff of *Simplicissimus*, Munich's celebrated satirical periodical, he acquired his first reputation as author of sketches and parodies. Later he wrote novels, mostly about gruesome and mystic topics, among which *The Golem* (1915), based upon an ancient Jewish legend of Prague, attained great success.

MEZEN, mā'z'n, Russian myā'zyin-y', river, Soviet Russia, Europe, about 550 miles long. It rises on the west slope of the Timan Mountains and flows south and then north-northwest, past the cities of Koslan and Mezen, to Mezen Bay, an arm of the White Sea. The upper course is strewn with rapids. It is navigable from May to November.

MEZEREUM, mē-zē'rē-ūm, or **MEZEREON**, mē-zē'rē-ōn, an Old World low shrub of the family Thymelaeaceae. The genus *Daphne* contains about 40 species of which the best-known is *Daphne mezereum*. See also: DAPHNE.

MEZES, mā'zēz, **Sidney Edward**, American educator: b. Belmont, California, Sept. 23, 1863; d. Pasadena, California, Sept. 15, 1931. He was graduated from the University of California in 1884 and received his doctor's degree from Harvard University in 1893. From 1894 to 1914 he was engaged in teaching, principally at the University of Texas, where he was professor of philosophy and dean of the college. In 1908 he was elected president of that university, and in 1914 he succeeded John H. Finley as president of City College of The City of New York, a position he held until 1927.

His published works include: *The Conception of God* (1897); *Ethics, Descriptive and Explanatory* (1901); *What Really Happened in Paris* (part author, 1921); and *The Intimate Papers of Colonel House*, 4 vols. (1926-1928).

MEZIERES, mā-zyār', **Alfred Jean François**, French critic and politician: b. Rehon, France, Nov. 19, 1826; d. there, Oct. 10, 1915. He studied at the École Normale and in Athens; was professor of literature at Nancy (1854-1861) and at the Sorbonne (1863); became a member of the French Academy in 1874; in poli-

tics was a member of the moderate Opportunists, and was deputy from 1881 to 1900, when he was elected senator for Meurthe-et-Moselle. Besides contributions to the *Revue des Deux Mondes* and *Temps*, he wrote *Shakespeare* (1861); *Shakespeare's Predecessors and Contemporaries* (1863); *Shakespeare's Contemporaries and Successors* (1864); *Dante* (1865); *Petrarch* (1867); *Goethe* (1872-1873); *In France* (1883); *Outside of France* (1883); *Mirabeau* (1891); *Petrarch* (1895); *Dead and Living* (1898); *The Passing Time* (1906); *Portraits of Soldiers* (1907); *Ulbina Verba* (1914).

MEZIERES or **MAISIERES**, mā-zyâr', Philippe de, soldier, crusader, and author: b. Château de Mézières, Picardy, about 1327; d. Paris, May 29, 1405. He served with the French Army in Smyrna in 1346, was knighted and afterward went to Jerusalem where he endeavored to found an order of knighthood to be maintained in Rome for its protection against the Mohammedans. He visited Cyprus in 1347 and made a convert of Peter of Lusignan, the son of King Hugo IV; and after the accession of Peter to the throne, in 1358, he returned to the island and became his chancellor, probably in 1360. He was associated here with the legate Peter Thomas, who became patriarch of Constantinople in 1364. Mézières traveled with King Peter to the courts of western Europe, seeking support for a new crusade, and was with him at the capture of Alexandria in 1365. One-third of the booty was awarded Mézières for the creation of his order, the plan of which was laid forth in his *Nova religio passionis* (1367-1368), and which he extended in 1386 and 1396. Finding the Crusaders unwilling to aid him in realizing his dream Mézières was commissioned to visit Venice, Avignon, and western Europe to enlist their aid for the kingdom of Cyprus against the sultan. Failing in his efforts he again sought converts for his order, but in 1368 returned to Cyprus, where he remained until the assassination of King Peter in 1369. In 1372 he was attached to the court of Pope Gregory XI, and in 1373 he became a counsellor of Charles V, at Paris. He enjoyed the king's full confidence and was tutor to his son, who became Charles VI. After the accession of Charles VI, however, Mézières retired to the Convent of the Celestines. He never lost touch with public affairs, but devoted himself chiefly to literature and the endeavor to establish his order at Jerusalem. His life of his friend and confrere, Peter Thomas, *Vita S. Petri Thomasi* (Antwerp 1659), contains a highly valuable account of the Alexandrian expedition. Most of his writings concerned his project for the founding of his Order of the Passion.

MEZIERES, capital city, France, of the Department of Ardennes, on the neck of a peninsula formed by the Meuse, 55 miles northeast of Reims, on the Eastern Railway. It is connected by a bridge with Charleville on the opposite bank of the Meuse, which, together with Arches, Pierre, and Mohon, forms practically one city with Mézières. It was formerly a fortified town but its forts were dismantled in 1886. It was successfully defended by Bayard against Emperor Charles in 1521, but was besieged and taken by the Germans in 1815 and in 1871. It fell into German hands early in World War I and remained in the enemy's hands until after the sign-

ing of the armistice, Nov. 11, 1918. Its parish church is a fine Gothic edifice dating from the 16th century. Together with Charleville it forms an important manufacturing center in the metallurgical industries.

During World War II many of the historic buildings of the city were damaged. Pop. (1946) 7,898.

MEZOTUR, mē'zû-tōor, city, Hungary, in the County Jász-Nagykun-Szolnok, on the Berettyo, an affluent of the Tisza, 88 miles east of Budapest. It is situated in a rich agricultural district for which it furnishes a trade center, and there are extensive communal pastoral lands upon which large herds of cattle are grazed. There are several large fairs held annually and the town has important potteries. Pop. (1941) 28,192.

MEZZANINE, in architecture, a low window occurring in attics and entresols. Sometimes applied to an entresol. A mezzanine story is a small story halfway between the stories above and below. In theaters it is usually a floor between the stage and the bottom of the deep cellars of large theaters, from which floor the short scenes and traps are worked, the large scenes going down through openings into the cellar; hence the name, from being midway between the stage and cellar floor.

MEZZOFANTI, mēd-dzō-fān'tē, Giuseppe, Italian linguist: b. Bologna, Sept. 17, 1774; d. Rome, March 15, 1849. He studied at the seminary of Bologna, and took priest's orders in 1797. He was appointed librarian and professor of Oriental languages at the university; in 1831 went to Rome, there succeeded Angelo Mai as keeper of the Vatican Library (1833), and in 1838 was made cardinal. It is said that he was familiar with over fifty languages, and even with the provincialisms of these various tongues. Byron called him "a monster of languages, the Briareus of parts of speech." His library and his papers came into the possession of the University of Bologna.

MEZZOTINT, mēd'zō-tint, a process of engraving on copper which dates from the 17th century. The smooth plate of the metal is abraded with a file-like tool, and tiny points are raised over the surface. These points catch and hold the ink, and an impression taken from a plate in this condition would give a soft velvety mass of black without variety of light and shade. A burnisher is next used to get rid of the raised points where half tones and lights are wanted. Sometimes where very brilliant high lights are required, they are cut away so as to ensure a smooth surface of copper. By means of this burnishing process, all gradations of light and shade are obtained from the white of the smooth copper to the black of the roughened plate. See also ENGRAVINGS; ETCHING.

MHOU, mou, town, India, in Madhya Bharat state, 12 miles south-southwest of Indore. It has an airport and is an important military station. Dairy farming is the most important industry. Mhou was one of the centers of the Sepoy Mutiny in 1857. Pop. (1941) 34,823.

MIAGO, myā-gā'ō, municipality, Philippines.

in the Province of Iloilo, Panay on the southern coast of the island, on Iloilo Strait, 22 miles west of the city of Iloilo. It is an agricultural center raising rice, sugar cane, and hemp. Pop. (1948) 30,143.

MIAMI, mi-ām'ī, town, Arizona, in Gila County, at an altitude of 3,400 feet, 68 miles east of Phoenix, and served by the Southern Pacific Railroad and state highways. It is located in a copper mining district and its prosperity depends largely upon the price of this metal. It was settled in 1910 and incorporated in 1918. It is governed by a mayor and council. Pop. (1950) 4,329.

MIAMI, city, Florida, seat of Dade County, a world-famous year-round resort and sports center situated 70 miles southwest of Palm Beach. Located at the mouth of the short Miami River, it extends for 12 miles along the shore of Biscayne Bay, and 8 miles inland, at an altitude of 15 feet. Miami has excellent highway, air, and rail connections, being served by the Florida East Coast and the Seaboard Air Line railroads, state and federal highways, and several airfields with scheduled air service. Miami's international airport is a regular stopping point for planes to South America, New York, Chicago, Cuba, and the West Indies, being served by over 15 scheduled airlines and 46 nonscheduled. The airports do an especially large air freight business, handling mainly citrus fruits and fresh vegetables. The city is connected to all points by steamship lines carrying both freight and passengers, while 14 lines do a brisk freight business between the city and South and Central America and the Caribbean area.

Greater Miami includes the independent municipalities of Miami Beach, Coral Gables, Hialeah, Miami Springs, Opa-locka, Miami Shores, Bal Harbor, North Miami Beach, North Miami, Biscayne Park, Surfside, El Portal, West Miami, North Bay Village, Golden Beach, Indian Creek Village, Medley, South Miami, Homestead, and Florida City. Seven bridges facilitate travel over the Miami River, and three splendid causeways connect Miami with Miami Beach across Biscayne Bay, while a fourth connects it with Virginia and Biscayne keys, the latter the site of Crandon Park, largest off-shore park in the United States.

The city has few historically interesting buildings but prides itself in its luxurious hotels and private residences on the ocean, in its climate, and in its many facilities for sportsmen, among them the Orange Bowl Stadium (site of the annual Orange Bowl football game), Miami Stadium (for baseball), and numerous municipally owned playgrounds. The city has excellent, modern grammar and high schools, and is the seat of Barry College, situated in Miami Shores, established in 1946 for women.

Tourists are Miami's most important industry. Winter visitors are principally from the northern cities, while summer visitors come from South and Central America, Cuba, and the Caribbean, visiting Miami to escape the heat.

Other industries include the manufacture of garments, concrete, metal, and meat products, and novelties, and there is extensive commercial fishing. Another source of income is the retired middle-income worker, who finds in Miami the inexpensive and easygoing living to fit his pension.

History.—Miami was incorporated in 1896,

soon after Henry M. Flagler extended the Florida East Coast Railroad from West Palm Beach to what is now Miami. A short time before its incorporation as a city, what is now Miami was a tiny agricultural and Indian trading settlement, consisting of but two dwellings, a storehouse, and Fort Dallas, a stone structure, still standing, used as an outpost during the Seminole Indian wars. In the 16th century the city's site was occupied by a large settlement of Tequesta Indians.

During the 1920's Miami was the scene of one of the greatest land booms in the country. However, a hurricane in 1926 coincided with a money panic and the land boom left many brokers with acres of swampland and brush, and no buyers. However, the city continued to grow even during the depression of the 1930's, and soon became the mecca of the sunbathers. During World War II, most of the fashionable hotels were taken over by the armed forces for quarters and training schools. Pop. (1940) 172,272; (1950) 249,276.

MIAMI, city, Oklahoma, seat of Ottawa County, situated 66 miles east of Bartlesville, and served by the Northeast Oklahoma and the Kansas, Oklahoma, and Gulf railroads, and federal and state highways. It is located in a rich grain growing, cattle raising, dairying, and mining district, and there are meat packing plants and manufactures of tires, glass, metal goods, wood products, clothing, and bedding in the city. Lead and zinc are mined in the neighborhood.

It is the seat of Northeastern Oklahoma Agricultural and Mechanical College. It was settled in 1891 and incorporated in the same year, and has a commission form of government. Pop. (1950) 11,801.

MIAMI (formerly GREAT MIAMI), river, Ohio, rising in Hardin County, and flowing south and southwest to enter the Ohio River at the southwest corner of the state. It is about 160 miles long and furnishes extensive power for manufacturing. It is still sometimes called Great Miami to distinguish it from the Little Miami. The Miami Canal, which paralleled the river for some 80 miles, was closed in 1895.

MIAMI, University of, coeducational, non-sectarian institution of higher learning, located in Coral Gables, Fla. It was chartered by the State of Florida, April 8, 1925, and opened its doors for registration Oct. 15, 1926. Among the signers of the charter were the late William Jennings Bryan, and his daughter, Mrs. Ruth Bryan (Owen) Rhode, who subsequently served in Congress from Florida, and later became United States ambassador to Denmark.

The university embraces the following schools: College of Arts and Sciences, and schools of music, law, engineering, education, business administration. There is also a Graduate School and an evening division.

The university maintains three campuses—north campus, on which are the original buildings of the university; main campus, 245 acres located one mile south of Coral Gables business center; and south campus, about 2,300 acres, located 13 miles south of the main campus. Here is located the university's experimental farm, also various laboratories. The average yearly enrollment of regular students is between 8,000 and 9,000: the evening enrollment is approximately 2,000.

MIAMI BEACH, resort city, Florida, located on an island across Biscayne Bay from the city of Miami, and connected with that city by three causeways. A large portion of the land within the city limits is filled land, formed by pumping rock and sand from the bottom of Biscayne Bay. The city has no industry save that of catering to the tourists which flock to its lavish hotels and pleasure resorts. All told, there are facilities for over 120,000 people on the island, and during the year the city plays host to over 1,500,000 tourists. There are 15 city parks, four golf courses, numerous playgrounds, beaches, recreation centers, and swimming pools.

The city was largely planned and developed by two men, John S. Collins and Carl G. Fisher, who filled in the jumble of mangrove roots and sand to eventually create the tourist paradise of today. It was incorporated in 1915 and during World War II most of its hotels were militarized. Pop. (1940) 28,012; (1950) 46,282.

MIAMI INDIANS, an Algonquian tribe whose earliest range was in Wisconsin, northern Illinois and Indiana. In the early 19th century the majority moved west into Kansas and later to Oklahoma, where they are now located on Miami and Peoria reservations in the Quapaw area. A small number remained in Indiana around Peru. The Miami are now much mixed with the Peoria and other tribes. There were 439 Peoria and 323 Miami Indians on this reservation in 1950. The two tribes are confederated under a treaty of Feb. 23, 1867 with the confederated Peoria, Kaskaskia, Wea, and Piankeshaw Indians granting permission for the confederation.

MIAMI SHORES, village, Florida, in Dade County, nine miles north of Miami. Bounded on the east by Biscayne Bay, Miami Shores is classified as a residential community. It is served by the Florida East Coast and the Seaboard Air Line railroads and U.S. Highway 1, and is the site of Barry College for women. It was separated from Miami in 1932 and has a council-manager form of government. Pop. (1950) 5,986.

MIAMI SPRINGS, town, Florida, in Dade County, adjoining the city of Miami. A residential community, it was incorporated in 1927, the first white settlement dating from 1924. It has manufactures of prefabricated houses.

The Miami Springs Golf Course here is the scene of many nationally known golf tournaments, and the Miami Battle Creek Sanitarium is an offshoot of the famous Battle Creek Sanitarium in Wisconsin. Government is by mayor and council. Pop. (1950) 5,108.

MIAMI UNIVERSITY, a coeducational institution of the higher learning located in Oxford, Butler County, Ohio. In 1788, J. C. Symmes purchased from the United States 1,000,000 acres of land, bounded south by the Ohio River, east by the Little Miami, and west by the Great Miami. One condition of the purchase was that a full township, six square miles, should be set apart "for the endowment of an academy and other seminaries of learning." This condition was not complied with; but as the prospect of the establishment of a university within the bounds of the Symmes purchase had

induced many to settle there, in 1803 Congress ceded to the State of Ohio the township of Oxford, to be held in trust for educational purposes. The university was incorporated in 1809. The lands are leased for 99 years (renewable forever, without reevaluation), subject to an annual quitrent of six per cent on the purchase money. The government is vested in a board of 27 trustees appointed by the governor of the state, nine of whom retire every third year. A grammar school was established in 1818, and in November 1824 the college department proper was opened. The school has teachers' and college departments, the courses leading to the degrees of B.A. and B.S. The average yearly enrollment is 5,000.

MIAMISBURG, mī-ām'iz-bürg, city, Ohio, in Montgomery County, at an altitude of 711 feet, 10 miles south of Dayton, situated on the Miami River, and served by the Cleveland, Cincinnati, Chicago and St. Louis, the Erie, and the Baltimore and Ohio railroads. It is in a tobacco growing region, and having abundant water power, is an important manufacturing center. It ships tobacco and cereals, and manufactures paper goods, furniture, binder twine, and tobacco and foundry products. A large Indian mound, 68½ feet high and 250 feet in circumference, is just outside the city, and there are atomic energy laboratories located here. The city was laid out in 1818. Pop. (1950) 6,329.

MIANA BUG, mī-ä'nä, a Persian tick of the genus *Argas*, greatly dreaded by travelers in former times, although its reputed powers of poisoning and otherwise harming humanity have been greatly exaggerated.

MIANI, mē-ä'nē, or **MEEANEE**, village, Pakistan, in Sind Province, six miles north of Hyderabad, scene of the victory of a small British force under Sir Charles Napier over the mirs of Sind, eventually leading to the conquest and annexation of Sind.

MIANI, town, Pakistan, in Shahpur District, northwest West Punjab, 100 miles northeast of Lahore. There are large salt mines nearby, and there is handloom weaving in the town. Pop. (1941) 6,713.

MIANTONOMO, mī-än-tō-nō'mō, American Indian chief: d. 1643. He was a sachem of the Narragansetts, with his uncle Canonicus, by 1632. In 1637 he assisted the early settlers of Massachusetts in the Pequot War. He was accused several times by the British authorities of plotting their destruction but was each time cleared of the charges. In 1643 he was attacked by Uncas, a sachem of the Mohegans and his bitter rival, and was captured and eventually turned over to the commissioners of the United Colonies at Boston. He was placed on trial, found guilty, and condemned to death, and Uncas was commissioned to carry out the sentence. He was buried where he fell and a monument was erected over the spot in 1841.

MIANWALI, mī-än-wä'li, town, Pakistan, in Rawalpindi Division, West Punjab, on the left bank of the Indus about 105 miles south of Pesk-awar, at an altitude of 655 feet. Along the river the land is fertile though liable to overflow in

time of flood, but in the highlands the soil is barren and sandy, and can be cultivated only when irrigation is possible. The chief products of the region are wheat, other grains, oil seeds, hides, and wool, and the city is the trading center for all these items. Pop. (1941) 22,825.

MIAO, mē-ä'ō, the general name of numerous aboriginal Chinese tribes dwelling in the provinces of Yunnan, Kweichow, Hunan, Kwangsi, and Kwangtung, China. They are hill-men and number some 80 tribes, with a population running into millions, although their numbers are decreasing.

MIAOULES or **MIAULIS**, mē-ou'lyēs, **Andreas Vokos**, Greek admiral: b. Negropont, about 1768; d. Athens, June 24, 1835. His family name was Vokos or Bokos, his surname Maioules being derived from the Turkish word for a felucca. He was a wealthy merchant captain living on the Island of Hydra at the outbreak of the Greek War of Independence in 1821, and was appointed to the command of the Greek Fleet. He assisted at the relief of the besieged Missolonghi in 1822-1823, and succeeded in blocking the Turks' further advances after their capture of Psara in 1824. He was able to supply troops and stores to Missolonghi (Mesolongion) in the second siege of 1825, although he could not prevent the fall of the town. He was outnumbered by the Egyptian naval forces, but succeeded in hampering their movements. He was superseded in the command of the Greek naval forces by Lord Dundonald in 1827, and thereafter ably supported his successor, the representative of the powers intervening in behalf of Greece. After the establishment of Greek independence he was a vigorous antagonist of the Capodistrias and the Russian party, and again commanded the fleet in the insurrection of 1831. He was one of the deputation commissioned to offer the Greek crown to King Otto I and he remained his staunch supporter. He was named by King Otto I rear admiral and later, vice admiral.

MICA (Lat. *mico*, flash), a mineral group marked by high basal cleavage, and laminae which may be made very thin by a process of continued separation. The micas are silicates; muscovite, the commonest, is a silicate of potassium and aluminum, and is often styled potassium mica; paragonite, of sodium mica, corresponds closely to muscovite, but has sodium instead of potassium; biotite, a silicate of magnesium, potassium and iron, is marked by its darker tints, and is commonly called magnesium iron mica; lepidolite is a lithium mica, with fluorine, potassium and aluminum in its composition, and a rose tint. Mica is widely scattered in North America and Asia, especially India. Ruby colored mica, no matter what its provenance, is now called "Indian." Europe has no commercial supply, but worthwhile deposits have been found in Argentina, Brazil, and Peru in South America, and promising ones in Southern Rhodesia, the Union of South Africa and elsewhere in Africa. Deposits are most frequently found in pegmatite (q.v.) dikes, varying in thickness from a few inches to several hundred feet, and correspondingly in length. Many other minerals accompany it, especially quartz and feldspar, and the mica is scattered through the dike, or vein, as the miners call it. Moreover, scarcely more

than ten per cent, and sometimes as little as two per cent, is commercially useful. Mica was well known in prehistoric America, traces of its use being widespread. A great shaft near Mount Mitchell, in North Carolina, was discovered in 1869. This not merely solved the question as to the origin of the early supply, but gave the first impulse to the mining of mica in the United States. Mica lands in North Carolina became tremendously valuable. This boom was quickly followed by the development of the industry in southern New Hampshire, and this, in turn, by important discoveries in the 1880's in Canada and India. In Quebec, Ottawa and Perth and Renfrew counties, Ontario, the supply is of excellent quality, and is easily mined and cheap. Hindu labor and an excellent grade of mica made the output of Bengal, Bombay, and the Madras presidency even cheaper. To classify the various sources of supply roughly, it may be said that India gives the world one half, and Canada, the United States, Brazil and Argentina furnish the bulk of the remainder. Everywhere the "veins" start near the surface, hence mining is simple.

Since 1895 there has been a fresh and most important use for mica, namely, as an insulator. For this purpose the sheets are split very thin and glued to cloth, then wound into rings for armatures. As a result of this variation of the uses of mica, only the colorless sorts, notably muscovite, are largely used for lamp chimneys and stove doors. Mica is also valuable as a lubricant, as an absorbent of glycerine in making dynamite, and in the manufacture of lithium salts. See also **MINERAL PRODUCTION OF THE UNITED STATES**; **STRATEGIC AND CRITICAL MINERAL SUPPLIES**.

MICA SCHIST, shīst, a schistose rock, metamorphic in nature, containing mica and quartz. The origin of most of the mica schists is uncertain; the sericite variety seems to be the result of mountain-building forces acting upon igneous rocks; other sorts are almost as certainly due to the same force acting upon sedimentary rocks. Mica occurring in schist is usually muscovite, that is, the colorless sort; biotite, or dark mica, is less frequent. Various embedded minerals also occur, notably garnets.

MICAH, mi'kā or **MICHAH** (in Douay Version, **MICHAËAS**) the sixth of the minor prophets, dwelt in Moresheth, a little town, once a dependency of the Philistine city of Gath, but by the conquests of Uzziah reduced with the whole of western Judah, including Gath, to Hebrew domination. His main public work was accomplished during the reign of Hezekiah. He dwelt on the great international highway between Egypt and Assyria, and was led to take a wide view of the political movements in Western Asia in their effect upon his own people. He lived in the 8th century B.C., and he witnessed the ending of the northern kingdom, and the invasion of Palestine by Sargon and Sennacherib. He witnessed also the corruption of morals which Hezekiah only partially corrected. His prophecy is directed against Samaria and Jerusalem, whose sufferings for their sins and irreligion, he declares, shall be greater than those of Babylon and the other gentile cities. His style is pure and correct, his images bold, his denunciations full of strength and severity.

MICAH, Book of. The title of the book, i, 1, describes it as "the word of Yahweh that came to Micah the Morashite in the days of Jotham, Ahaz, and Hezekiah, kings of Judah." In Jeremiah xxvi, 18, is a quotation from the words of the elders: "Micah the Morashite prophesied in the days of Hezekiah king of Judah." The chronology of this period is somewhat uncertain. The probable dates, however, are Jotham, 740-736; Ahaz, 736-727; Hezekiah, 727-695. The title, like most similar titles, is doubtless a later editorial addition. Hence the evidence indicates most definitely the activity of Micah during the reign of Hezekiah. The most probable period is shortly before the capture of Samaria, i, 5-6, perhaps about 724 B.C., although this might refer to a later period, inasmuch as Samaria was not entirely destroyed at that time and, according to the Assyrian records, was active again not long after that event.

It is now quite generally agreed that Micah was not the author of the whole of the book. But there is much difference of opinion concerning the details of authorship. The most of chapters i-iii is a unity, with the exception principally of ii, 12-13, and was doubtless written by Micah. This is throughout a message of condemnation with a prediction of punishment upon Judah, and to a minor degree upon Israel, for their sins. The remainder of the book contains some portions of a tenor similar to this, but consists for the most part of messages of blessing and restoration. There are two parts, chapters iv-v, and vi-vii. It seems reasonably certain that Micah was not the author of all of iv-vii, especially because of obvious inconsistencies, both within these chapters and as compared with i-iii: v, 2-4, e.g., is out of harmony with v, 5-6; iv, 11-13 is inconsistent with iii, 12. The connection of thought in iv-vii is not close so that evidently either the original order has been changed, or it was originally a composite of miscellaneous portions. The following portions in iv-vii are similar, as messages of punishment, to i-iii, and were probably written by Micah: v, 1, 10-13; vi, 9-16; vii, 1-6. Most of the remainder of iv-vii together with ii, 12-13 contains messages of hope and restoration after disaster. It is a possibility that most of this may have been written by Micah. But, if so, it must have been at a different period, presumably much later, as Isaiah probably gave some messages that were distinctly of hope at the latter end of his ministry. The strong probability remains, however, that these portions were not written by Micah but consist of various later fragments, mostly of the time of the exile and after the exile. The change of tone is less probable for Micah than for Isaiah, because Micah's original message had in it no real hope, while that of Isaiah did, at least from an early period in his ministry.

Micah is described as the Morashite, meaning probably an inhabitant of Moreseth-gath, Micah i, 14. This place is not mentioned outside of this verse. It probably was a town named Moreseth, a dependency of the well-known Philistine city Gath. He was thus of the country, and shows a corresponding type of message, differing markedly from that of his contemporary Isaiah who was a city-dweller, an inhabitant of Jerusalem. Micah's denuncia-

tion of the sins of the people and threats of punishment are similar to those of Amos. His most characteristic specific addition to the prophetic message is the prediction, first given by him, that Jerusalem shall be destroyed for the sins of the people, iii, 12. The later additions to Micah for the most part contain no specially notable message. vi, 6-8 give, however, a clear statement of the high prophetic ideal of life.

GEORGE RICKER BERRY,

Professor Emeritus of Semitic Languages and Literature, Colgate-Rochester Divinity School.

MICAH CLARKE, a novel by Sir Arthur Conan Doyle, published in 1888. It presents in the form of fiction a graphic and vivid picture of the political condition in England during the Monmouth Rebellion (1685).

MICAWBER, mī-kā'bēr, Mr. Wilkins, a shiftless, unsuccessful optimist, always in trouble, but always sure "something will turn up," one of the secondary characters in Dickens' 'David Copperfield' (1849). He is a portrait of the novelist's father, not only in character but in the principal incidents in his career, and Mrs. Micawber, who has great faith in her husband, was patterned after Dickens' mother.

MICELLAR THEORY, in botany, the theory, proposed in 1862 by the Swiss botanist K. W. Nägeli (q.v.), that the accretion of starch-grains and similar bodies within cells in a living plant, and the formation and growth of the walls of cells, was by means of molecules, each an aggregation of lesser molecules, to which he gave the name *micellæ*. They are invisible to even the highest powers of a microscope. Two or more having united, the growth of the grain to be composed, or the cell-wall to be broadened, is accomplished by more micellæ crowding into crevices between those already in place. Some important plant-physiologists have always refused to accept this hypothesis, which is now generally distrusted.

MICHAEL, mī'kēl or mī'kā-ēl (Hebrew, "who is Godlike"), is spoken of in Daniel (x, 13, 21; xii, 1) as one of the "chief princes," and the "great prince." In Jude (verse 9) he is called the archangel who disputed with the devil about the body of Moses. In the Revelation (xii, 7) it is said "there was war in heaven: Michael and his angels fought against the dragon." From this expression it has been inferred that he was the chief of the celestial hierarchy. Milton calls him "of celestial armies prince," and "prince of angels," and attributes to him the command of the heavenly forces. He was ranked by Thomas Aquinas, followed by Dante, as the first of the seven archangels, a character in which he first appears in the Ethiopian Enoch, in which he is represented as executing the commands of God at Judgment Day, or presenting the prayers of the saints before the throne of God. In France especially churches dedicated to this saint, whose day in the Western Church is 29 September, are often built on the loftiest hill tops, to afford the

warrior angel a vantage ground in warring against the evil "powers of the air" and driving off plague, drought and murrain.

MICHAEL I, RHANGABE, or RHAG-ABE, Byzantine emperor: d. about 845. He succeeded Stauracius in 811 and after carrying on war with the Bulgarians was deposed in 813 by Leo V, an Armenian general in his service, and spent the rest of his life in a convent.

MICHAEL II Balbus (THE STAMMERER), Byzantine emperor: d. 829. He came of an obscure Phrygian family, but was ennobled by Leo V. The latter, however, suspecting Michael of conspiracy against him, ordered the Phrygian to be put to death. Michael saved himself by the assassination of Leo and became emperor in 820. During his reign Sicily and Crete were lost to the Western empire.

MICHAEL III (THE DRUNKARD), Byzantine emperor: d. 867. He was a grandson of Michael II, and in 842 succeeded his father, Theophilus, though his mother Theodora continued regent till 856. With his uncle, Bardas, he made an expedition against the Bulgarians in 861 and converted the king of Bulgaria. In 866 he associated Basilus the Macedonian with himself in the government and was assassinated by him the next year.

MICHAEL IV (THE PAPHLAGONIAN), Byzantine emperor: d. 1041. He received his surname from the place of his nativity, and became chamberlain to Zöe, wife of the Emperor Romanus III. On the death of Romanus in 1034 he became emperor and the husband of Zöe, who is presumed to have murdered Romanus because of her love for Michael.

MICHAEL V, Calaphates (THE CALKER), Byzantine emperor. He was a nephew of Michael IV, whom he succeeded on the throne. His banishment of the Empress Zöe led to a revolt in Constantinople, in which he was overthrown and compelled to retire to a convent.

MICHAEL VI (THE WARRIOR), Byzantine emperor. He succeeded the Empress Theodora in 1056, but after the expiration of a year was deposed by Isaac Comnenus and spent the rest of his life in a convent. He was the last of the Macedonian dynasty.

MICHAEL VII, Ducas or Parapinaces, Byzantine emperor. He was the son of Constantine XI, and came to the throne in 1071. He was a weak monarch, the prey of unscrupulous favorites, and an insurrection in 1078 drove him from the throne and into a monastery.

MICHAEL VIII, Palæologus, Byzantine emperor: b. 1234; d. 1282. After having commanded the French mercenaries employed by the emperor of Nicæa he became one of the guardians of the Emperor John Lascaris in 1259. The next year he was proclaimed joint emperor of Nicæa in 1260, and the next year, after deposing his colleague Lascaris, became sole monarch. In the same year he wrested Constantinople from the Latins and was shortly afterward crowned emperor of the Byzantine empire. He made an unsuccessful attempt to effect the union of the Western and Eastern Churches.

MICHAEL IX, Palæologus, Byzantine emperor: d. 1320. He was the son of Andro-

nicus II, with whom he was associated in the government after 1295, but died before his father.

MICHAEL, Tsar of Russia. See ROMANOFF.

MICHAEL, Arthur, American chemist: b. Buffalo, N. Y., 7 Aug. 1853. He was educated at the universities of Berlin and Heidelberg, and at the École de Médecine de Paris. He was professor of chemistry at Tufts College in 1882-89 and in 1894-1907, and was professor emeritus there in 1907-12. From 1912-36 he held the professorship of organic chemistry at Harvard University. He was a member of the National Academy of Sciences. He made extensive researches in pure chemistry and published reports of his investigations in the 'Proceedings' of the National Academy of Sciences; the *American Chemical Journal*; and the 'Berichte der deutschen chemischen Gesellschaft.' D. Orlando, Fla., 8 Feb. 1942.

MICHAEL, Attaliates, Byzantine jurist: lived in 11th century. He wrote a history of the years 1034-79; and published a succinct and methodic abridgment of the Basilicæ (1073).

MICHAEL, a pastoral narrative in 482 lines of blank verse, by William Wordsworth, was composed and published in 1800. In a letter to Fox, 14 Jan. 1801, Wordsworth writes: "In the two poems, 'The Brothers' and 'Michael,' I have attempted to draw a picture of the domestic affections, as I know they exist among a class of men who are now almost confined to the north of England. They are small independent proprietors of land, here called statesmen, men of respectable education, who daily labor on their little properties . . . Their little tract of land serves as a rallying-point for their domestic feelings, as a tablet upon which they are written, which makes them objects of memory in a thousand instances, when they would otherwise be forgotten." The theme of Michael, as suggested in Wordsworth's letter, has two phases: the love of a "statesman" for his little landed property in the hills, and of a father for his son. The story of the poem is founded upon fact. To Michael and his wife in their old age is born a son, Luke, whom his father cherishes both as a companion and as his heir. When Luke is 18 years old, Michael, through the fault of another, loses a portion of his property. Luke must go to the city and there earn enough to redeem the land. Before the boy leaves, he lays the corner-stone of the sheepfold which he and his father were to build together, now left for the old man to build alone. Far away in the city, Luke is finally led away by bad companions and is heard from no more. The old father's heart is broken; the sheepfold, symbol of his faith and love, is never finished.

'Michael' is an illustration of Wordsworth's theory that the emotions find their best soil in common life, where they "are incorporated with the beautiful and permanent forms of nature." Michael himself is perhaps Wordsworth's ideal man, and, possibly because he was the type best known to the poet, is more clearly portrayed and more highly individualized than any other of Wordsworth's characters. He has the ruggedness, strength

and majesty of the Westmoreland hills among which he lives. The setting, the characters and the story of the poem are too interdependent, too integrally fused, to be separately analyzed. The style, classical in its simplicity and restraint, and stripped of all extraneous ornament almost to severity, is merely a crystal medium through which appears the essential poetry of the subject. The magical suggestiveness of such lines as

"Hence had he learned the meaning of all winds,"

and

"..... he had been alone
"Amid the heart of many thousand mists,"

are far surpassed both in suggestiveness and essential poetry by the simple passage which states that the old broken-hearted father often tried to complete the sheepfold, and that

"many and many a time he thither went
"And never lifted up a single stone"

MARION TUCKER

MICHAEL AND HIS LOST ANGEL.

Mr. Henry Arthur Jones during his long career as a playwright wrote more than half a hundred plays which may be roughly divided into three categories,—melodramas, comedies of manners and serious plays. Of the latter group 'Michael and His Lost Angel' is generally regarded by writers on modern drama as the most notable. This consensus of opinion is the more interesting in view of the fact that although on 15 Jan. 1896 the play received the rare distinction of a simultaneous production in London and New York, with Forbes-Robertson and Marion Terry in the principal rôles in London and Henry Miller and Viola Allen in New York, it failed in both places, was withdrawn in its second week and has never been revived. The two chief characters are familiar ones on the stage and especial favorites with Jones, namely, the priestly ascetic and the worldly siren. The opening scene is thoroughly effective. Michael Feversham, an austere young clergyman, has forced the erring daughter of his secretary to public confession of her sin in the church before all the townspeople. When Audrie Lesden, a mysterious and charming new parishioner, presently appears on the scene, we are left in no doubt from the moment of her entrance that she is the temptress; her tempting, indeed, is so obvious, the fall of Michael so predestined, and the expiation of his guilt by public confession so plainly foreshadowed in the first scene, that there are no surprises. A more serious defect is that the author fails to enlist the sympathy of his audience for either of his main characters. Michael remains a "holier than thou" prig with what the Freudians would call an "impurity complex," and Audrie is so patently selfish and frivolous that only an actress of very great personal charm could make Michael's infatuation convincing.

MICHAEL KOHLHAAS. This story by Heinrich von Kleist was published as the first of his *Erzählungen*, "Stories" (1810), after a fragment of the story had been issued in a periodical, *Phæbus*, two years before. Michael Kohlhaas, an upright and highly respected horse-dealer, is wantonly wronged by a young nobleman; after fruitless efforts to obtain justice from the legally constituted authorities, he

resolves to take matters into his own hands, even in rebellion against the social order which has failed to afford him protection. With pathetic obstinacy he still insists upon the simple terms of his original claim, even after the forces which he has gathered about him have engaged in a kind of civil war. Ultimately he gains his contention, recompense for his loss and the punishment of the privileged offender, but he himself suffers death as a penalty for crimes committed while seeking justice in his own way. The outlines of the story Kleist took from the career of Hans Kohlhaase (executed in 1540), which was probably familiar to him both by oral tradition and through the chronicles of Haffnitz and Leutinger. But Kleist used the artist's prerogative and altered the material at will, creating the characters anew, and supplying the substance with an ethical problem. Through a sense of personal wrong, following his own conception of justice, a man of spotless integrity becomes a criminal and an outlaw. The problem of so-called folk-justice, which is here illustrated, has been notably treated elsewhere in German literature, conspicuously in Ludwig's 'Erbförster.' Kleist followed his historical source in introducing Martin Luther into the story of his hero, and presents a firmly drawn portrait of the German reformer. The story is a masterpiece of narrative skill; it is all narrative, without description of people or of places, without comment or sentiment; it moves forward with the simplicity of a chronicle, one event following another in tragic and inevitable succession. 'Michael Kohlhaas' is one of the most powerful stories in the whole range of German fiction. It was translated into English by Frances H. King in 'The German Classics' (Vol. IV).

HARVEY W. THAYER.

MICHAEL OBRENOVITCH III, *ö-brën'-ö-vich*, Prince of Serbia: b. Kragujevat, 4 Sept. 1823; d. near Belgrade, 29 May 1868. He was the youngest son of Prince Milosh, and after the abdication of his father, in 1839, and the death of his brother Milan Obrenovitch II, in 1840, he succeeded to the throne of Serbia. His effort to continue the policy of his father, which was to free Serbia and the Christian peoples of the Balkans generally from Turkish rule, met with the support of Russia and the determined opposition of Turkey and Austria, together with that of the party which had deposed his father. A revolt in 1842 resulted in the election of Alexander Karageorgevich as Prince of Serbia, and Prince Michael was forced to leave the country. In 1858 his father, Prince Milosh Obrenovitch II, was recalled to the throne and upon his death in 1860 Michael succeeded him. He at once set about securing the emancipation of Serbia's internal affairs from Turkish domination, secured an understanding with Montenegro, Greece, Austria and the Bulgarian, Bosnian and Albanian leaders for either support or non-intervention in case of war with Turkey, and demanded the withdrawal of Turkish troops from Serbian fortresses. He was supported in his demands by the influence of Great Britain, Russia and Austria, and Turkey yielded, the forts being surrendered 26 April 1867. He largely reorgan-

ized the administration of public affairs, strengthened the military organization, and placed his country in the ranks of civilized European states. A plot against him was organized by followers of the deposed Karageorgevich dynasty and he was assassinated. He was succeeded by a cousin, Milan I (r. 1868–1889).

MICHAELIS, mī-kä-ä'līs, **Adolf**, German archaeologist: b. Kiel, Germany, June 22, 1835; d. Strasbourg, Aug. 12, 1910. He was educated at Berlin, Leipzig, and Kiel universities, was professor of archaeology at Strasbourg after 1872, and was a member of the German Central Archaeological Institute at Rome after 1874. He was the author of numerous works on classical archaeology, notably *Der Parthenon* (1871), *Ancient Marbles in Great Britain* (1882), and *Kunstgeschichte des Altertums* (*History of the Art of Ancient Times*, 1898). He edited successive issues of volume 1 of Anton Springer's *Handbuch der Kunstgeschichte* after Springer's death in 1891.

MICHAELIS, **Georg**, German statesman: b. Haynau, Germany, Sept. 8, 1857; d. Bad Saarow, July 24, 1936. He entered the Prussian civil service in 1879, held various administrative posts in the German Imperial government after 1915, and in 1917 succeeded Theobald von Bethmann-Hollweg as chancellor of the German Empire. As chancellor he tried unsuccessfully to reconcile demands for peace with moderate nationalistic aims. He was dismissed by Emperor William II in November 1917, because, it is said, he failed to take a decisive stand on the question of peace with the Allies. He was the author of an autobiography, *Für Staat und Volk: Eine Lebensgeschichte* (1922) and a book of travel essays, *Weltreise-gedanken* (1923).

MICHAELIS, **Johann David**, German Biblical scholar: b. Halle, Germany, Feb. 27, 1717; d. Göttingen, Aug. 22, 1791. He studied at the University of Halle, traveled in Great Britain and the Netherlands, and subsequently joined the faculty of the University of Göttingen, where he was professor of philosophy (after 1746) and of Oriental languages (after 1750). He was the author of numerous works on the structure of Hebrew and other Near Eastern languages and on the social and cultural background of the Bible. He is considered the founder of modern Biblical studies in Germany. Michaelis was the editor of *Orientalische und exegetische Bibliothek*, 24 vols. (1771–1779) and 8 vols. (new ser., 1786–1791).

Consult Smend, Rudolf, *Johann David Michaelis* (Göttingen 1898).

MICHAELIS, mē-kä-ē'lēs, **Karin** (or MICHAELIS-STANGELAND, -stāng'ē-lān), Danish author: b. Randers, Denmark, March 20, 1872; d. Copenhagen, Jan. 11, 1950. Privately educated, she turned from an early interest in music to literature and social problems, working and writing on behalf of the underprivileged and the rights of women. She wrote pro-German stories and novels in World War I, but in World War II was active in the anti-German Free Danish movement in the United States. Twice-married, in 1895 to Sophus Michaelis (q.v.), from whom she was divorced, and in 1912 to Charles Emil Stangeland, an American diplomat, she advocated trial marriage and insurance policies to protect women from the financial difficulties of divorce or perpetual maid-

enhood. Her novel *The Dangerous Age* (1910), dealing with the emotional problems of a woman of 45, created a sensation, was translated into 20 languages, and sold a million copies. Her other works include *The Child* (1902), *The Governor* (1913), *The Girl with the Flowerpot* (1925), *Mother* (1935), and an autobiography, *Little Troll* (1946).

MICHAELIS, mī-kä-ä'līs, **Leonor**, German-American physical chemist: b. Berlin, Germany, Jan. 16, 1875; d. New York, N. Y., Oct. 9, 1949. He received a doctorate in medicine from the University of Berlin in 1896, and subsequently studied at the University of Freiburg and again in Berlin under Paul Ehrlich, discoverer of the Salvarsan treatment for syphilis. At the Ehrlich laboratories he discovered the histologic staining properties of Janus green, useful in preparing certain cell structures (mitochondria) for microscopic examination. Michaelis also worked at the Berlin Institute of Cancer Research (1902–1906), the Berlin Municipal Hospital (1906–1922), the Medical School, Nagoya, Japan (1922–1926), the Johns Hopkins University (1926–1929), and the Rockefeller Institute for Medical Research (1929–1940). He made important contributions to knowledge concerning the properties of enzymes and proteins and the nature of metabolic oxidation and reduction. His discovery that keratin, a protein of the hair is soluble in thioglycolic acid, made possible cold-permanent-wave coiffures for women.

MICHAELIS, mē-kä-ē'lēs, **Sophus**, Danish author: b. Odense, Denmark, May 14, 1865; d. Copenhagen, Jan. 28, 1932. He was the author of numerous works of fiction, poetry, and drama. *Sirenen* (*Sirens*, 1898), and *Das Fest des Lebens* (*Festival of Life*, 1902), *Die Palmen* (*Palms*, 1904), volumes of verse; the novel *Æbelø* (1895), and the dramas *Revolutionsbrøllup* (*The Revolutionary Wedding*, 1906), and *Den evige Søn* (*The Eternal Sleep*, 1912). He was celebrated for his translations of Goethe's *Faust* and novels by Gustave Flaubert.

MICHAELIUS, mē-kä-ē'līs, **Jonas**, first minister of the Dutch Reformed Church at New Amsterdam: b. Grootebroek, the Netherlands, 1584; d. the Netherlands, after 1637. Educated at the Latin school of Hoorn, near Grootebroek, and at the Theological College, Leiden, he was a minister of the Dutch Reformed Church in Brabant and Holland between 1605 and 1624. In 1628 he emigrated with his family to New Amsterdam, where he organized a church that subsequently became the Collegiate Church of New York City. He quarreled with Director General Peter Minuit and his council, whom he accused of fraud, immorality, and oppression. The directors of the Dutch West India Company, who controlled New Amsterdam, refused to hear his charges and prevented his reappointment to the ministry at New Amsterdam after 1637. Michaelius returned to the Netherlands, probably permanently, in 1633. Three of his letters are extant, including one in Latin containing a hostile account of Minuit and his council.

Consult Eekhof, Albert, *Jonas Michaelius, Founder of the Church in New Netherland* (Leiden 1926).

MICHAELMAS, mīk'ēl-mās, or **MICHAELMAS DAY**, a feast honoring St. Michael and all

the angels, celebrated annually on September 29 by the Roman Catholic Church and the churches of the Anglican Communion.

In England, Michaelmas is one of four traditional quarter-days (q.v.), and its name designates a quarterly court term (October 12 to December 21) and academic terms at Oxford (October 1 to December 17) and Cambridge (October 1 to December 19). Formerly, English civil magistrates were elected at Michaelmas, perhaps in allusion to St. Michael as the prince of guardian angels. Another Michaelmas custom in England is the eating of roast goose, traditional since the 15th century or earlier. According to an old English proverb, one who eats goose on Michaelmas Day will not lack money all the year.

MICHAELMAS DAISY. See **ASTER**.

MICHAL, mī'kēl, in the Old Testament, a daughter of Saul (I Samuel 14:49; 18:20). Michal was offered by Saul to David on condition that he kill 100 Philistines. The offer was intended as a snare, but the feat was accomplished, and Saul in jealousy sent soldiers to kill David. Michal contrived David's escape (I Samuel 19:11-17). Subsequently Saul gave her to Phalti who was eventually compelled to relinquish her to David (I Samuel 25:44; II Samuel 3:13-16). Michal and David became estranged when she rebuked him for immodest dancing before the Ark in celebration of its restoration to Jerusalem (II Samuel 6:16-23).

MICHALAKOPOULOS, mē-kā-lā-kō'pōō-lōs, **Andreas**, Greek statesman: b. Patras, Greece, 1875; d. Athens, March 27, 1938. A lawyer, he entered politics as a Liberal, was elected deputy for Patras in the national assembly of 1910, and held several posts (1912-1916) in cabinets formed by Elutherios Venizelos, whose pro-Allied policy in World War I Michalakopoulos supported. He became prime minister of Greece in 1924, and subsequently was also minister of foreign affairs; but in 1925 he was overthrown by Gen. Theodoros Pangalos and exiled. His later career was marked by successive returns to office as foreign minister (1926, 1932, 1933). He was again exiled, shortly before his death, by Gen. Ioannes Metaxas.

MICHAUD, mē-shō', **Joseph François**, French journalist and historian: b. Albens, France, June 19, 1767; d. Passy, Sept. 30, 1839. He was a journalist in Paris, where, he edited the royalist periodical *La Quotidienne* (1796). His monarchist writings caused him in 1795 to be sentenced to death by a tribunal of the First French Republic, but the sentence was revoked and he escaped to Switzerland. He soon returned to Paris, produced several political satires and historical works, and in 1815, when the Bourbon monarchy was restored, resumed publication of *La Quotidienne*. After 1813 he was a member of the Académie Française.

Michaud's writings include *Adieux à Bonaparte* (1799); *Histoire des progrès et de la chute de l'empire de Mysore sous Hider Aly et Tippou-Saëb* (1801); *Histoire des croisades*, 7 vols. (1812-1822); *Histoire des quinze semaines ou le dernier règne de Bonaparte* (1815). With Jean Joseph François Poujoulat he edited *Collection de mémoires pour servir à l'histoire de France depuis le XIII^e siècle*, 32 vols. (1836-

1839). With his brother, **LOUIS GABRIEL MICHAUD** (1773-1858), he compiled *Biographie Universelle*, 52 vols. (1811-1828), a standard reference work, several times reprinted and sometimes called *Biographie Michaud*. Louis Gabriel Michaud was the author of several independent biographies, notably of Louis Philippe (1849) and of Charles Maurice de Talleyrand-Périgord (1853).

MICHAULT, mē-shō', **Pierre**, French poet and rhetorician: b. in Franche-Comté; d. c.1467. He was a retainer of Charles the Bold, comte de Charolais and duc de Bourgogne. He composed an allegorical satire called, variously in successive editions, *Le doctrinal du temps présent* (1466) or *Le doctrinal de court, par lequel on peut estre clerc sans aller à l'escole* (1522). In mingled prose and verse, it tells how the author was conducted by Merit (*Virtu*) through various schools in which the students were graded according to their vices. Michault also composed *La danse des aveugles* (1506), a kind of satiric drama, in prose and verse, the principal characters of which include Fortune, Love, and Death, three blind persons "before whom everyone must dance." He may have collaborated in the writing of *Cent nouvelles nouvelles* (q.v.), a collection of tales which was later used as source material by Jean de La Fontaine for his *Fables*.

MICHAUX, mē-shō', **André**, French botanist: b. near Versailles, France, March 7, 1746; d. in Madagascar, Nov. 16, 1802. He studied under the French botanist Bernard de Jussieu and subsequently visited England, Persia, and the United States, collecting specimens and data for botanical studies. He was the author of *Histoire des chênes . . . de l'Amérique septentrionale* (1801) and *Flora boreali-americana* . . . (1803).

His son, **FRANÇOIS ANDRÉ MICHAUX** (1770-1855), collaborated with him in botanical researches in the United States and was the author of *Histoire des arbres forestiers de l'Amérique septentrionale* (3 vols., 1810-1813; trans. as *The North American Sylva*).

MICHAUX, **Henri**, French poet and painter: b. Namur, Belgium, May 24, 1899. His poems, in mingled verse and prose, exhibit a surrealistic play of fantasy and a great variety of prosodic effects. He is the author of *Un certain plume* (1930), *Un barbare en Asie* (1947; trans. *A Barbarian in Asia*, 1949), *Epreuves, exorcismes 1940-1944* (1945), and *Arriver à se reveiller* (1950).

MICHEL, **Claude**. See **CLODION**.

MICHEL, mīch'ēl, **DAN** (Middle English "sir," "master"), or **MICHEL OF NORTH-GATE**, English monk and translator: fl. 1340. A brother in the cloister of St. Augustine of Canterbury, he is remembered for his translation of a French moral treatise by Laurentius Gallus entitled *La somme des vices et des vertues* (1279). Dan Michel's translation, in the Kentish dialect of Middle English, is called *The Ayenbite of Inwit* (that is, *The Remorse of Conscience*). A manuscript bearing the autograph of Dan Michel and dated 1340 is preserved in the British Museum, London. The poem is valued by scholars as a dated specimen of the Kentish dialect spoken in the middle of the 14th

century. Consult editions by Stevenson for the Roxburghe Club (1855); Morris for the Early English Text Society (1876).

MICHEL, Francisque Xavier, French archaeologist: b. Lyons, 18 Jan. 1809; d. Paris, 18 May 1887. He was educated at Lyons and became known for his work in editing French manuscripts of the Middle Ages. He was sent to England in 1833 and to Scotland in 1837 for the purpose of making researches for the French government. He was appointed professor of foreign literature at the Faculté des lettres at Bordeaux in 1839. He edited numerous manuscripts written between the 11th and 14th centuries, among them 'Chanson de Roland' and 'Roman de la Rose.' He later translated into French many works of Goldsmith, Shakespeare, Sterne and Tennyson; and he was author of 'Histoire des races naudites de la France et de l'Espagne' (2 vols., 1847); 'Recherches sur le Commerce pendant le moyen-âge' (2 vols., 1852-54); 'Études de Philologie comparée sur l'argot' (1856); 'Histoire du commerce et de la navigation à Bordeaux' (2 vols., 1867-71), etc.

MICHEL, François Emile, frän-swä ä-mël mē-shël, French painter and art critic: b. Metz, 19 July 1828; d. 24 May 1909. After studying under Migette and Marechal, he made his début in the Salon in 1853, since which he has produced 'Summer Nights' (1872); 'Sowing in Autumn' (1873); 'The Harlem Sound' (1885); the two latter being now in the Luxembourg. He was elected to the Institute in 1892. Among his works are 'Rembrandt' (1886); 'Jacob van Ruysdael et les paysagistes de l'école de Haarlem' (1890); 'Le maître du paysage' (1906); 'Nouvelles études sur l'histoire de l'art' (1908); 'La forêt de Fontainebleau' (1909).

MICHEL, Louise, French anarchist: b. Vroncourt, Upper Marne, France, 29 May 1830; d. Paris, 9 Jan. 1905. When very young she wrote verses of unusual power and in 1860 opened a school in Paris. In the Franco-German War she tended the sick and wounded and took part in the sorties from Paris; and during the government of the Commune in 1871 she fought at the barricades, was made prisoner, sentenced to deportation for life, and spent some years in New Caledonia, but was pardoned by the amnesty of 1880 and returned to Paris, where she edited 'La Révolution sociale' and continued her anarchistic teachings. She was imprisoned in 1883 and in 1886, later made her home in London, where she continued her work and returned to Paris in 1895. Her sobriquet, 'The Red Virgin of Montmartre,' was a tribute to the purity of her life. She published 'Le Coq Rouge'; 'Les Méprisées'; 'Ses Mémoires'; 'L'Ere Nouvelle.' Consult Gerault, E., 'La bonne Louise' (1906).

MICHELANGELO, Buonarroti, mī-kěl-än'jē-lō or mē-kěl-än'jā-lō, boo-ō-nār-rō'tē, whose name during his lifetime was written as Michelagnolo (or Michelangiolo) di Ludovico di Buonarroti-Simoni; Italian sculptor, painter and architect: b. Caprese, Tuscany, 6 March 1475; d. Rome, 18 Feb. 1564. The family was well established as a family of citizens in Florence; but had been allowed heraldic bearings, a custom not unusual in relation to the controlling families of the Italian cities.

At a very early age Michelangelo became a student of fine art, entering first the workshop of Domenico Bigordi, called Ghirlandajo, and studying also in a primitive kind of art school which had been formed in the palace and gardens of Lorenzo dei Medici. It appears that the extraordinary abilities of the boy were noticed by his patrons and also by the artists of the epoch from the first. Michelangelo thought of himself only as a sculptor, and he put his energies into the study of bas-relief and statuary; studying the remains of Græco-Roman antiquity which were accessible, and producing works of such importance as caused surprise to his contemporaries, although most of these very early works are either lost altogether or are uncertain—pieces which are usually ascribed to this epoch not having certain ascriptions. The earliest very important work which has remained to us is the Pietà, which is now in a chapel of Saint Peter's Church at Rome. The figures are slightly larger than life, the Madonna holding the body of Christ on her lap in a not unusual attitude; a belt passing over the left shoulder of the Virgin is inscribed with the name of Michelangelo the Florentine: which is for years the only case in which Michelangelo signed a piece with his name. The famous group of the Madonna and Child in the Church of Notre Dame at Bruges, in Belgium, is generally accepted as the work of Michelangelo, and if so, was of this early epoch. The reason for its transportation to Bruges is disputed. An entirely authentic piece of the time is a colossal David, which having been for three centuries in the open air at the portal of the Palazzo Vecchio at Florence, is now under shelter in the Accademia in the same city. This extraordinary work is a frank attempt to render the as yet imperfectly developed form of a very young man.

The only portable painting which can with certainty be ascribed to Michelangelo belongs to the closing years of the 15th century, when Michelangelo was approaching the age of 25 years. This is the circular picture, a Madonna with the Child and Saint Joseph, in the Uffizi Gallery. The fact of his producing this and several other small works of painting is not to be counted against his accepted position as a sculptor; for most of the artists of the time practised in the different arts, and it is probable that Michelangelo was at this time much less in the habit of painting than were other sculptors of well-known ability. His own continual occupation upon works of pure form in marble was a sufficient reason for his continued abstention from the sister arts.

With the election of Pope Julius II began the Roman life of Michelangelo, for he was called upon by the new Pope in 1505 to build a great monument which the Pope desired to finish within his own lifetime. This monument was never completed, however, and the controversies and other difficulties which arose continually with regard to it, embittered a large part of the great artist's life and consumed time which could but ill be spared from actual work. The great statue of Moses, which was executed at a somewhat later time (not to be exactly fixed), was the only very important piece of statuary completed for this tomb.

In 1506 Michelangelo returned to Florence.

and at that time there was a decided pause in the work upon the tomb, as other thoughts had taken up the mind of the Pope. Indeed, his return to Rome was followed immediately by the commencement of the painting upon the vault of the Sistine Chapel. This work as we have it is much the most important piece of mural painting of the modern world, for it occupies the whole vaulted room, 133 feet long and 45 feet wide, and is one continuous and unbroken composition containing hundreds of figures, life-size, of heroic size, and colossal, and done in pure fresco, except as it has been retouched in places, either by the artist himself or in later times, in what is called dry fresco—that is to say, the colors laid upon the dry plaster. There is this marked characteristic of the painting—that it has no landscape backgrounds except in the small compartments devoted to *The Deluge* and *The Temptation*, nor any other accessories as of costume, arms, buildings and the like, but is everywhere a simple architectural composition of painted pedestals and corbels seeming to carry figures which themselves are painted in the most abstract way—studies of the human form simply dressed and having no artistic interest other than that. It has generally been considered that the paintings draw their only importance from the astonishing power of the draughtsmanship and the great composition of abstract lines; but a more careful consideration of what they were before their partial defacement by the smoke of candles and the injuries and repairs which they have received, shows that the work is one of interest as to color composition as well. Michelangelo has never shown himself to be a colorist in the sense in which Correggio and the great Venetians were colorists, but then the medium in which he painted was fresco, that is, painting upon wet plaster, which does not lend itself to elaborate combinations of warm and profuse coloring—its tendency is always toward pale combinations and the expression of delicately modulated form rather than of chromatic splendor. It is not, however, intelligent criticism to say that these paintings are the work of a sculptor taken rudely from the practice of his own art. On the other hand, it is quite unreasonable to say, as some English critics have said, that the turning of Michelangelo to sculpture had been unfortunate, as depriving us of the greatest of Christian religious painters while giving us only a melodramatic sculptor. The truth is that this artist is the most perfect exemplar of that way of treating all fine art, of which form alone (pure and abstract and almost separated from its usual purpose, as that of description and narrative), is the subject studied and gives the effect sought. Everything else—truth of anatomy, expression of face, energy of pose and of apparent movement—is subordinated to the one important thing, the getting of form which would be splendid in the artist's eyes. If, then, we have to regret a frequent excessiveness and extravagance of design, it can only be said that the extraordinary energy and force of the man, driving him on to undertake more than mortal man could achieve even had he been (as Michelangelo was not) left to pursue his own course in peace, resulted as of necessity in frequent exaggeration in the very desire to give vigor and as yet untried combinations of form as

shown in the human body posed singly or in elaborate groups.

After 1513, when Julius II died, Michelangelo undertook a façade for the church of Saint Lorenzo in Florence. This front was never finished; but not long after he began the building of a new sacristy for this church, in which square room, very finely adorned with classical architectural forms, are the two remarkable tombs of the princes Lorenzo and Giuliano dei Medici. These monuments have each a seated statue of the prince in question, raised high above the sarcophagus; and on the lid of the sarcophagus two colossal reclining figures, in each case one man and one woman. The sculptures are not all completed. The extraordinary power of their modeling has made these monuments very famous in the modern world.

About 1535 Michelangelo settled finally in Rome, and from that time until his death was very much occupied as an architect in connection with the great church of Saint Peter. The building had been going on for many years, and different architects had successively changed the design, so that Michelangelo took up the work at that point where it became necessary to roof the central mass. This he did by means of the famous cupola which dominates the city of Rome and the country around, although the rounded shell of stone itself was not erected during his lifetime.

As an architect Michelangelo was not, on the whole, beneficial to Italy or to the art of the 16th century, because he had never, as a youth, studied construction or the use of details, and because his almost exclusive devotion to more elaborate and organic forms than those possible to architectural masses, prevented his designing such features as frontons and consols with gravity and simplicity. The architecture inspired by him, and more especially that produced by his immediate successors, ran to extravagance; and the worst period of Italian decorative art was to follow upon his own epoch of work. The sculpture of his later years is much less important and much less in quantity than might have been expected; but the work upon the church occupied his energies, and in 1535 he was appointed by Pope Paul III, architect, sculptor and painter to the papal palace, and he began work immediately upon the east wall of the Sistine Chapel. Here he painted that prodigious 'Last Judgment' filling all the wall above the altar, including the lunette, and up to the nearly semi-circular vault. The picture is, like the ceiling paintings, entirely a study of the human body in vigorous action, and in highly studied pose. As a work of color, or even of light and shade, it is almost unrecognizable for what it was, as the smoke of the candles on the altar has caused very great changes in color, and has led to repainting, and because of certain painted additions made in the next century in order to disguise the complete nudity of the figures.

Throughout his life Michelangelo had been a writer of verse, and it is known that important sonnets of his were left by him. These, however, were edited in a destructive manner by his nephew, so much so that we have at the present day no certain knowledge, even, of what the poems were as they left Michelangelo's hand. This part of his intellectual life has been

treated with great thoroughness by John Addington Symonds in his life of the artist (1892); and on which Walter Pater writes fascinatingly in 'The Renaissance: Studies in Art and Poetry' (1912). The frescoes of the Sistine Chapel have been peculiarly the study of Heath Wilson who, about the middle of the 19th century, had a scaffolding erected in the chapel and studied the paintings inch by inch, and who recorded his observations in a valuable book (1876). Apart from these two books and the life by Harford (1857), the best book on Michelangelo is the volume of the 'Gazette de Beaux-Arts,' published in 1876. This volume contains papers by the sculptor, Eugène Guillaume, the architect, Charles Garnier, and the competent writers, Charles Blanc, Paul Mantz, A. Mézières and Anatole de Montaiglon. Karl Frey's 'Michaelagnolo Buonarrotti' publication of which began in 1907; Thode's 'Michelangelo und das Ende der Renaissance' (1902-12); and Venturi's 'Michelangelo' (1928) are among the more recent authoritative sources.

RUSSELL STURGIS.

MICHELANGELO, Life of. Herman Grimm's Life of Michelangelo, apart from its value as the record of a notable life, is one of the masterpieces of German prose. Written at a time when photographic illustrations were unknown (it was published in 1860) and when the expense of travel barred Italy to most young artists, its purpose was to give them a vivid and realizable word-picture of the sculptures, paintings and architectural creations of the most universal of all artists, and at the same time to show how constructive a part art can play in the spiritual life of a nation when artists are large enough for leadership.

It is not only a biography; it is a history of the Italian Renaissance with Michelangelo as the central figure. During the 80 years of his life Italian art knew Donatello, Ghirlandajo, Leonardo da Vinci, Titian and Raphael; Savanarola lived and died praying for the soul of Florence; the Popes—Borgias, Farneses, Medicis—exerted their power for good and ill in the world of the sword as well as the world of the spirit; the Medicis fought for the temporal mastery of Florence and conquered, fought and lost again. In every part of this seething political, religious and artistic life Michelangelo had his share. His life and that of Florence ran parallel lines. The star of Florence had barely risen when Michelangelo sculptured his first marbles in the garden of the Medicis; it had set, never to rise again, before his body was brought back for burial from the Rome which had been his refuge when Florence deserted her tradition of freedom.

It is the achievement of Herman Grimm—that which places this biography with Boswell's Life of Johnson and the Autobiography of Benvenuto Cellini—that he has known how to make the city and the times live equally with the man whom he portrays, and how to give form and color to the figures of the lesser men and women in his picture. Fine illustrations heighten the value and the interest of new editions, both in the original and in the translation by Miss Bunnett.

MICHELET, Jules, zhül mēsh-lā, French historian: b. Paris, 21 Aug. 1798; d. Hyères, 9 Feb. 1874. His father was an unsuccessful

printer, and his boyhood was one of poverty and want. He was educated at the Lycée Charlemagne and in 1821 became a professor at the Collège Rollin. After the revolution of 1830 he was appointed chief of the historical section in the Archives, and in 1838 professor of history at the Collège de France. He lost his offices by his refusal to take the oath of allegiance to Napoleon III (1851) and thereafter devoted himself to his busy literary labors. His 'Histoire de France' (18 vols. 1833-67; new ed. 19 vols. 1879) is among the monumental productions of historical composition, and definitely established his fame. His 'Histoire de la Révolution' (1847-53; new ed. 1889) is a splendid specimen of eloquent writing, but hardly a great history. In all his historical writing Michelet has been criticized for unduly subordinating historical values to dramatic effect and for permitting his prejudices to destroy his perspective. But his descriptions are remarkably vivid, and his rendering of certain episodes is unsurpassed. Among his further writings are 'Précis de l'histoire moderne' (1827); 'Histoire romaine' (1831); several volumes of impressions of nature—'L'Oiseau' (1856), 'L'Insecte' (1857), 'Z'Amowe' (1859); 'La Mer' (1861); 'La Montagne' (1868); and several volumes of polemics. Consult 'Lives' or studies by brushes (1898); 'Corréard' (1886); 'Monot' (1905); and 'Jules Simon' (1886).

MICHELET, Karl Ludwig, kārł lood'vig mēshē-lā, German philosopher: b. Berlin, 4 Dec. 1801; d. 16 Dec. 1893. He was graduated from the University of Berlin in 1824, and in 1829 was appointed to the professorship of philology and philosophy in the French gymnasium, which he held for 25 years. In 1829 he also became professor of philosophy in the University of Berlin. He devoted himself especially to the doctrines of Aristotle and published 'Die Ethik des Aristoteles' (1827), an edition of the Nicomachean ethic with Latin commentary (1829-33), and a memoir entitled 'Examen critique du livre d'Aristotle, intitulé Métaphysique' (1836), which was crowned by the Academy of Moral and Political Sciences. From 1832 to 1842 he was engaged as one of the editors of Hegel's works, in illustration of whose system he wrote 'Geschichte der letzten Systeme der Philosophie in Deutschland von Kant bis Hegel' (1837-39). 'Entwicklungsgeschichte der neuesten Deutschen Philosophie' (1843); and a controversial dissertation, 'Schelling und Hegel' (1839). His own standpoint and tendency are most decisively shown in his 'Vorlesungen über die Persönlichkeit Gottes und die Unsterblichkeit der Seele, oder die ewige Persönlichkeit des Geistes' (1841); and 'Die Epiphanie der ewigen Persönlichkeit des Geistes' (1844-52).

MICHELL, mīch'ēl, John, English physicist, geologist and astronomer: b. about 1724; d. Thornhill, Yorkshire, 29 April 1793. He was educated at Queen's College, Cambridge, became a Fellow there, and in 1762 was made professor of geology. From 1767 until his death he was rector at Thornhill. His invention of the torsion balance shortly before his death preceded that of Coulomb, and was used by Henry Cavendish in his famous experiment determining the mean density of the earth.

Michell also described a method of making magnets, *A Treatise of Artificial Magnets, in which is shown an easy and expeditious method of making them superior to the best natural ones* (1750). He also made valuable contributions to the knowledge of astronomy. Author of *Conjectures Concerning the Cause and Observations upon the Phenomena of Earthquakes* (1760); *A Recommendation of Hadley's Quadrant for Surveying* (1765); *Proposal of a Method for Measuring Degrees of Longitude upon the Parallels of the Equator* (1766); *An Inquiry into the Probable Parallax and Magnitude of the Fixed Stars* (1767); *On the Means of Discovering the Distance, Magnitude, etc., of the Fixed Stars* (1784).

MICHELL, John Henry, Australian mathematician: b. Maldon, Victoria, Australia, Oct. 26, 1863; d. Camberwell, Victoria, Feb. 3, 1940. Educated at Trinity College, Cambridge, he later became a fellow there. As assistant professor of mathematics at the University of Melbourne he earned an international reputation for researches in mathematical physics. A Fellow of the Royal Society, he contributed to the Mathematical Society *Proceedings* (London); other publications include *Theory of Free Stream Lines* (1890), *The Wave Resistance of a Ship* (1898), and *Theory of Uniformly Loaded Beams* (1900).

MICHELOZZO, mē'kâ-lôt'so, or **MICHELOZZI** (full name, MICHELOZZO DI BARTOLOMEO), Italian goldsmith, sculptor, and architect: b. Florence, 1391 or 1396; buried there, Oct. 7, 1472. He studied sculpture under Donatello and architecture under Brunelleschi, and was a protégé of Cosimo dei Medici. He worked in silver, bronze and marble as a sculptor and attained a high reputation for his work; but his fame rests principally upon his achievements as an architect, his name ranking among the foremost of the famous Florentine architects of the 15th century. He executed the silver statue of Saint John in the Duomo, Florence, and also the bronze statue of that saint in the Bargello, and the terra cotta figure of him in the court of the church of the Annunziata, Florence. Much of his work as a sculptor was done with Donatello and it is difficult to establish its identity. He designed the library of San Giorgio Maggiore at Venice, as well as other buildings there, during the period when he shared the exile of his patron, Cosimo dei Medici. He designed the Riccardi Palace in Florence for the Medici, and his skill as an engineer was attested by his repairing and partially rebuilding the Palazzo Vecchio, which was falling to ruin. He also undertook the repairs and remodeling of the monastery of San Marco at Florence when it was given to the Dominicans of Fiesole by the Medici. He designed the Medici summer villa at Careggi, the pilgrim's guest-house, Jerusalem, the Medici palace at Fiesole and many other buildings. His style effected a combination of early Italian Gothic and the classical type with marvelous simplicity and lightness, withal statelyness of line. Consult Müntz, E., *Histoire de l'art pendant la Renaissance* (1890-1895).

MICHELS, Roberto, Italian economist and sociologist: b. Cologne, Germany, Jan. 9, 1876; d. Rome, Italy, May 2, 1946. Educated at the

universities of Paris, Munich, Leipzig and Halle, he was successively docent at the University of Brussels (1905), professor of economics at Turin (1907), of economics and statistics at Basel (1913), of economics and sociology at Perugia (1928). His publications include *Brautstandsmoral* (1903); *Patriotismus und Ethik* (1906); *Storia del Marxismo in Italia* (1908); *Der Patriotismus* (1929); *Il Boicottaggio* (1934).

MICHELSEN, Peter Christian Hersleb Kjerschow, Norwegian statesman and philanthropist: b. Bergen, Norway, Mar. 15, 1857; d. near Bergen, June 29, 1925. Elected to the Storting in 1903, two years later he was appointed prime minister. A persuasive advocate of the independence movement and also of international conciliation, he led his country through the crisis ending in 1905 in dissolution of the union with Sweden and restoration of the independent kingdom of Norway. In 1907 he retired from political life. The greater part of his fortune was bequeathed to the Christian Michelsen Institute of Science and Intellectual Freedom, its charter receiving royal confirmation in 1929. Situated at Bergen, the institute has as its guiding principle the founder's ideal of contributing to a spirit of tolerance on national as well as international levels. This it seeks to accomplish by giving 5-year appointments to research workers of outstanding ability engaged in disinterested scientific investigations, also by undertaking "cultural or scientific work for the promotion of tolerance and forbearance between nations and races, in religious, social, economic and political life."

MICHELSON, Albert Abraham, American physicist: b. Strelno, Posen, Germany, Dec. 19, 1852; d. Pasadena, Calif., May 9, 1931. He came to the United States when a boy; was graduated at the U. S. Naval Academy in 1873; took graduate courses in physics in Berlin and Heidelberg and in Paris; and resigned from the navy in 1883 to become professor of physics at the Case School of Applied Science, Cleveland, Ohio. From 1889 to 1892 he was professor of physics at Clark University, and from 1892 to 1929 was head of the department of physics in the University of Chicago. His experiments resulted in new figures for the velocity of light in *vacuo*, and his inferential refractometer (1886-1887) enabled the use of wave-lengths of light as a measuring unit. He also invented the echelon spectroscope, and in 1920 demonstrated the diameter of Alpha Orionis to be 260,000,000 miles, the first measurement of a star's diameter. The Nobel Prize for physics was conferred on him in 1907. He wrote *Light Waves and Their Uses* (1903).

MICHIE, mīk'ī, Peter Smith, American military engineer and author: b. Brechin, Scotland, March 24, 1839; d. West Point, N. Y., Feb. 16, 1901. He came early to Cincinnati, graduated from West Point (1863), and joined the engineers as lieutenant. He served as assistant engineer in the operations around Charleston in 1863-1864 and as chief engineer of districts in the Department of the South. In 1864 he was transferred to the Army of the James, served in the operations against Richmond and was present at Ap-

pomattox in 1865. He was promoted brevet brigadier general and later brevet lieutenant colonel of volunteers in 1865, and was promoted captain in the regular army. He was appointed first assistant in the department of engineering and chemistry at West Point in 1867, and from 1871 until his death he was professor of natural and experimental philosophy there. He served on the board of overseers of the Thayer School of Civil Engineering at Dartmouth from 1871. He was a member of a government commission to Europe in June–November 1870 studying fortifications. In addition to textbooks on physics, he was author of *The Life and Letters of Emory Upton* (1885), *The Personnel of the Sea Coast Defenses* (1887), and *General McClellan* (1901).

MICHIGAN, mish'i-gän, one of the north central states of the United States, within the region of the Great Lakes. It is composed of two peninsulas, a southern and northern, separated by the Straits of Mackinac. The Upper Peninsula is bounded on the north by Lake Superior; on the east by Lake Superior, Whitefish Bay, Lake Huron, and St. Marys River which separates Michigan from the Province of Ontario, Canada; on the south by Lake Huron, Straits of Mackinac which separate the two peninsulas, and Lake Michigan; and on the southwest and west, by Wisconsin. The Lower Peninsula is bounded on the north by Lake Huron, Straits of Mackinac, and Lake Michigan; on the east by Lake Huron, St. Clair River, Lake St. Clair, Detroit River, and Lake Erie (the rivers separating the state from Ontario, Canada); on the south by Ohio and Indiana; and on the west by Lake Michigan.

The origin of the name is somewhat obscure. Dr. William Jones of the Field Museum of Natural History, Chicago, Ill., notes that the Chippewa Indians on the north shore of Lake Superior referred to Lake Michigan by the name *Mishawiguma*, meaning expansive waste, since there were few or no islands in the lake. The Algonquian expression for great water was *michi guma*. A name frequently applied to Mackinac, and later spread to include a considerable area, was *Michilimackinac*, meaning the place of the big lame person, and was derived from the name of an allegedly extinct Algonquian tribe, the Mishinimaki, or Mishinimakinagog. While the origin of the state name is uncertain, Perry F. Powers states, however, that the name Michigan first appeared in the congressional proceedings of 1804.

Nicknames	Auto State; Lady of the Lakes; Lake State; Wolverine State
Song	<i>Michigan, My Michigan</i> (Douglas Malloch)
Tree	Not Official None

State seal.

Physical Characteristics. — Topography. — The western half of the Upper Peninsula is a part of the Laurentian upland area of North America. Upon a foundation of ancient Archean rocks are laid old sedimentary formations of limestone and sandstone containing iron and copper deposits. The eastern half of the Upper Peninsula and the entire Lower Peninsula are composed of more recent sedimentary formations. These occur one above the other like a nest of shallow dishes filling a structural basin the rim of which is represented by the Archean rocks of the western half of the Upper Peninsula. Glacial ice made the exact outlines of the state. The structural basin of Lake Superior was deepened and glacial tongues dug the present depressions occupied by Lakes Michigan, Huron, and Erie. Retreating ice spread over the state a mantle of glacial drift which forms the present surface features and covers the underlying rock over all of the state except the higher parts of the western half of the Upper Peninsula. This material was arranged by the ice fronts into hilly belts, rolling plains, and uplands. It blocked the previous drainage channels and left thousands of undrained depressions making Michigan a state of many lakes, swamps, and marshes. In the southern half of the Lower Peninsula the glacial mantle formed fairly rich loamy soils but over most of the northern parts sandy and poorer soils. This difference in soil material between the southern part of the Lower Peninsula and the remainder of the state divides Michigan into a southern part which is agriculturally well developed and prosperous and a northern part where farming is successful only in some localities.

The southern half of the Lower Peninsula bears a level to gently rolling surface, the most conspicuous features of which are chains of low glacial hills. The highest points of these hilly chains reach altitudes between 1,000 and 1,200

feet above sea level. The northern half of the Lower Peninsula is composed largely of a tableland capped by hilly belts of glacial origin attaining elevations between 1,200 and 1,700 feet. This tableland is the water divide between the rivers flowing westward, northward, and eastward into the bordering Great Lakes. The eastern half of the Upper Peninsula is fairly level nowhere more than 400 feet above the surrounding lake levels and contains considerable areas of swampy land. The western half is higher and more rugged with successions of rocky ridges, sandy plains, and wet shallow valleys. The highest elevations in the state occur along the Lake Superior shore on rocky, almost mountainous, ridges called the Huron Mountains (elevation 1,950 feet) in Marquette and Baraga counties, and the Porcupine Mountains (elevation 2,023 feet) in Ontonagon County.

Rivers and Lakes.—Approximately 70 per cent of the surface of the state is drained by 34 primary river systems; the remaining 30 per cent draining directly into the lakes by smaller streams. The Saginaw, with its tributaries the Shiawassee, the Tittabawassee, and the Cass, form the largest system draining approximately 6,500 square miles into Lake Huron. Other principal rivers of the Lower Peninsula which empty into Lakes Huron or Erie are the Raisin, the Huron, the Au Sable, the Thunder Bay and the Cheboygan River. The Lake Michigan drainage is accomplished principally by the Kalamazoo, the Grand, the Muskegon, the Manistee, and the Boardman. The Upper Peninsula rivers flowing into Lakes Michigan and Huron are the Menominee, the Escanaba, the Whitefish, the Manistique, and the St. Marys which latter form the international boundary with Canada. The north-flowing rivers of the Upper Peninsula are the Montreal which is the boundary with Wisconsin, the Ontonagon, the Sturgeon, and the Tahquamenon. There are more than 11,000 lakes in the state, of which 6,454 are large enough to be listed in the *Michigan Lakes and Streams Directory*. Houghton Lake in Roscommon County is the largest of these, with 31 square miles of surface. The length of the courses of the major rivers is 5,499 miles; in addition there is an estimated 30,000 miles of tributaries. The state has 3,177 miles of shore lines, more than any other in the Union; of this 120 are in harbors. Because of their glacial origin some of the best soils in the state are improved by artificial drainage and drainage project areas cover nearly one quarter of the state. The largest areas of drained lands are located in the southern half of the Lower Peninsula.

Climate.—Michigan is characterized by well marked seasons. January temperatures average below 16°F. along the northern coast of the Upper Peninsula and over 26°F. in the southwest and southeast corners of the state. July temperatures in the same localities will average under 65° and over 72°F. respectively. The growing season varies considerably over the state. In the interior of the Upper Peninsula it is 80 to 90 days and along the shores of that peninsula 140 days. In the Lower Peninsula it varies from a minimum of 90 to 100 days in the northern interior to a maximum of 180 days in the extreme southwest. The effects of the lakes are important especially in a narrow belt

along the Lake Michigan shore devoted to fruit cultivation. Precipitation is adequate for agriculture and is fairly evenly distributed throughout the months. It varies from 26 inches annually in the northern interior of the Lower Peninsula to 36 inches along the Ohio border. Some of this is in the form of snow; 140 inches falling in the "Copper Country" of the Upper Peninsula diminishing to 30 inches in the southeast corner of the state. Over Michigan as a whole, one day in three is rainy and one in two is cloudy. In summer there is a preponderance of clear, and in winter of cloudy days.

Political Divisions.—**Cities.**—Detroit, with a population of 1,849,568 in 1950, is the fifth most populous city of the United States and the largest city in Michigan. Its standard metropolitan area, comprising Wayne, Macomb, and Oakland counties, accounts for more than 45 per cent of the state's population. Situated in southeastern Michigan on the Detroit River, across from Windsor, Ontario, Detroit has many and varied industries and is the principal automobile manufacturing center of the world. Grand Rapids (pop. 1950, 176,515), Michigan's second city, is located in the west central part of the state, 25 miles east of Lake Michigan. It is nationally known for the manufacture of furniture and household equipment, and also produces automobile parts and bodies. Flint (163,143), 50 miles northwest of Detroit, is the third largest city of the state and ranks second to Detroit in the manufacture of automobile bodies and parts. Michigan's fourth city, Dearborn (94,994), situated 10 miles west of Detroit, is important for the manufacture of automobiles and aircraft. Saginaw (92,918), 31 miles northwest of Flint, is the principal city of the Saginaw Valley and the fifth most populous city in the state. Formerly one of the greatest lumber producing cities of the world, it is now occupied with diversified manufacturing and with sugar beet refining and other food-processing activities. Lansing (92,129), the capital city, located in the central part of the southern portion of the state, is the sixth city in size, is the principal trading center for central Michigan, and is an important automobile manufacturing city. Adjoining it is East Lansing, the seat of Michigan State College of Agriculture and Applied Science, the first state institution of its kind to be established in the United States. Pontiac (73,681), 24 miles northwest of Detroit, is an automobile manufacturing city, and Kalamazoo (57,704) is a noted paper manufacturing city located in southwestern Michigan. In 1950, Michigan had 10 cities with populations of more than 50,000 and 33 other cities with more than 15,000 inhabitants. (For populations of cities, see reverse side of state map.)

Counties.—The state is organized into 83 counties, 68 in the Lower and 15 in the Upper Peninsula. A list of counties and county seats follows:

UPPER PENINSULA

County	County Seat	County	County Seat
Alger	Munising	Keweenaw	Eagle River
Baraga	L'Anse	Luce	Newberry
Chippewa	Sault Ste. Marie	Mackinac	St. Ignace

The People.—The first white settlers in Michigan were Frenchmen who took up land around the frontier forts. The French and the British who succeeded them discouraged immigration preferring the profitable fur trade to extensive land settlement. In 1810 there were less than 5,000 people in the state and of these nearly half lived at Detroit. By 1837 when Michigan was admitted into the Union, transportation from the east and roads through the territory had induced a population of 87,273, two thirds of whom had come from New York and the New England states. Within a few years after statehood immigrants began to arrive from Europe. These came both as individuals and as colony groups, in response to a program of advertising conducted by the commissioner of immigration. German colonies were settled near Saginaw, Ann Arbor and other locations in the southeastern part of the state. Beginning in 1846, the Dutch built up communities in the western part at Holland and Zeeland and later Dutch immigration extended these areas of settlement. Large numbers of Irish came to the state but did not settle in distinct districts. Except for the Dutch these early elements have lost their identities with the mother countries although some Lutheran churches still hold German language services. During the period from 1860 to 1900 lumbering and mining operations drew Swedes, Norwegians, and Finns, as well as many Italians into the state. The Finns migrated principally to the Upper Peninsula and remain in the population of that area as distinct racial groups in many localities. Industrial development around Detroit provided employment opportunities for unskilled immigrants who spoke little English, and beginning about 1910 these arrived in large numbers from Poland, Italy, Russia, Austria-Hungary and many other European countries. This later immigration was largely urban and industrial, in contrast to the earlier which had been rural and agricultural. There was little increase in the rural population

after 1870 although there was some exchange as rural people were attracted to the cities and immigrants succeeded them on the land. During World War I the need for industrial manpower brought to Detroit and other Michigan cities an influx of Negroes from the southern states. In 1910 there were 17,115 Negroes in the state; in 1920, 60,082; in 1930, 169,453; in 1940, 208,345.

Until 1910 there were more rural than urban people in the state but since that time the growth of industrial cities has shifted the balance to the urban side.

Famous Men and Women.—In the field of government and politics, Michigan numbers among her sons Henry Hastings Sibley (Detroit, 1811-1891), fur trader and later governor of Minnesota; William Lawrence Penfield (Dover, 1846-1909), jurist; Truman Handy Newberry (Detroit, 1864-1945), businessman and politician; and Frank Murphy (Harbor Beach, 1890-1949), lawyer and member of the United States Supreme Court; Thomas E. Dewey (Owosso, 1902), governor of New York.

In military affairs, there are Alexander Macomb (Detroit, 1782-1841), soldier; Henry Jackson Hunt (Detroit, 1819-1889), soldier and artillery officer; William Rufus Shafter (Kalamazoo County, 1835-1906), soldier; George Le Roy Irwin (Fort Wayne, 1868-1931), soldier; and George Owen Squier (Dryden, 1865-1934), soldier, scientist, and electrical engineer.

Outstanding industrialists include Robert Hawley Ingersoll (Delta, 1859-1928), manufacturer of the famous Ingersoll one-dollar watch; Martin Antoine Ryerson (Grand Rapids, 1856-1932), capitalist, philanthropist, and art collector; Roy Dikeman Chapin (Lansing, 1880-1936), industrialist; and Henry Ford (Dearborn Township, 1863-1947), automobile manufacturer.

In the field of science and education, there are Alfred Noble (Livonia, 1844-1914), civil engineer; Calvin Thomas (Lapeer, 1854-1919), Goethe scholar and educator; William James Beal (Adrian, 1833-1924), botanist and educator; Alfred Hulse Brooks (Ann Arbor, 1871-1924), geologist and geographer; William Albert Loey (Troy, 1857-1924), zoologist, teacher, and historian of biological science; Robert Simpson Woodward (Rochester, 1849-1924), engineer, mathematical physicist, and teacher; Max Levy (Detroit, 1857-1926), photoengraver and inventor of the hemocytometer; Jeremiah Whipple Jenks (St. Clair, 1856-1929), economist, teacher, and author; Henry Rogers Seager (Lansing, 1870-1930), economist and teacher; Claude Halstead Van Tyne (Tecumseh, 1869-1930), historian and teacher; James William Toumey (Lawrence, 1865-1932), forester and teacher; and Paul de Kruif (Zeeland, 1890-), bacteriologist and author.

Among those who have won fame in music, art, and literature are Brownson Crocker Howard (Detroit, 1842-1902), playwright; Frederick Russell Burton (Jonesville, 1861-1909), composer and student of Indian music; Will [William] McKendree Carleton (near Hudson, 1845-1912), poet; Henry Edward Krehbiel (Ann Arbor, 1854-1923), music critic, historian, author and lecturer; Frederick Stuart Church (Grand Rapids, 1842-1924), painter; James Oliver Curwood (Owosso, 1878-1927), novelist; Julius Rolshoven (Detroit, 1858-1930), painter; John Albert Macy (Detroit, 1877-1932), author, literary critic, poet, and socialist; [Julius] Gari Melchers (Detroit, 1860-1932), painter; and Stewart Edward White (Grand Rapids, 1873-), fiction writer.

Other native born sons include Charles Michel De Langlade (Mackinac, 1729-c. 1801), remarkable French half-breed, became known as "Father of Wisconsin" and to tribesmen as Akewaugketauso; Leonard Bacon (Detroit, 1802-1881), clergyman; James Anthony Bailey (Detroit, 1847-1906), showman who united with P. T. Barnum in 1881; Olympia Brown (Prairie Ronde, 1835-1926), minister and suffragist; Cressy Livingston Wilbur (Hillsdale, 1865-1928), vital statistician; Delos Franklin Wilcox (near Ida, 1873-1928), franchise and public utility expert; and Milton Alexander McRae (Detroit, 1858-1930), newspaper publisher.

Other prominent citizens whose fame is linked with the history of the state are Douglass Houghton (Troy, N. Y., 1809-1845), geologist; Henry Rowe Schoolcraft (Albany County, N. Y., 1793-1864), ethnologist; Lewis Cass (Exeter, N. H., 1782-1866), lawyer and governor of Michigan Territory; George A. Custer (New Rumley, Ohio, 1839-1876), headed Michigan brigade in the Civil War; Zachariah Chandler (Bedford, N. H., 1813-1879), politician; Robert McClelland (Greencastle, Pa., 1807-1880), lawyer, congressman, and governor of Michigan; Thomas McIntyre Cooley (near Attica, N. Y., 1824-1898), jurist and writer on constitutional law; Russell Alexander Alger (Lafayette, Ohio, 1836-1907), politician and governor of Michigan; Henry Billings Brown (South Lee, Mass., 1836-1913), jurist and member of the United States Supreme Court; James Burrill Angell (near Scituate, R. I., 1829-

1916), president of the University of Michigan (1871-1909); Donald McDonald Dickinson (Port Ontario, N. Y., 1846-1917), lawyer, Eliza Maria Mosher (Cayuga County, N. Y., 1846-1928), physician, educator, and civic worker; Edwin Denby (Evansville, Ind., 1870-1929), politician; and Edgar Albert Guest (Birmingham, Eng., 1881-), poet; and Thomas A. Edison (Milan, Ohio, 1847-1931) inventor.

Natural Resources.—The soils of the southern part of the Lower Peninsula are of good quality for agriculture and the climate conducive to the growth of forage crops. The immense harvest of timber from the northern part of the state is now past but regrowth of the forest promises a smaller but a steady supply of lumber. Iron, limestone, and salt deposits have produced vast quantities of materials and still contain large reserves. The abundant surface waters of the state make a remarkably even flow in the rivers which is utilized by 80 hydro-electric plants with 347,670 kilowatts capacity. Its position on the Great Lakes waterway and in the communication network of the United States has enhanced importance of the state in the industrial scheme of the country. For detailed information, consult the section on *Production and Manufacture*.

Fauna.—Michigan is well represented in its stock of fish, game, and birds. Its many streams and lakes are abundant with trout, pike, bass, perch, smelt, sunfish, crappies, and catfish; the commercial catches are lake trout, whitefish, suckers, chubs, and lake herring. Among its more important game and fur-bearing animals are the deer, black bear, rabbit, hare, beaver, wolf, coyote, muskrat, weasel, mink, otter, marten, raccoon, opossum, red fox, and badger. Most of the birds are migratory, although a considerable number remain all year. The pheasant, woodcock, partridge, and wild geese and ducks are the more important game birds.

Flora.—Michigan boasts of more species of trees on native soil than in all of Europe. After the settlers arrived, large areas were stripped by lumbermen, although many acres have been reforested. While evergreens are predominant, the Lower Peninsula abounds in hardwoods such as elm, oak, maple, and hickory. There is also an abundance of fruits and vines which produce nuts, berries, and tubers. Among the shrubs are the currant, blackberry, raspberry, and gooseberry. There is a large variety of wild flowers, mosses, and ferns.

Parks and Preserves.—Much of the cut over land in the northern part of the state is not of good enough quality to support agriculture. Through the process of tax delinquency a large acreage has come into state ownership and is assigned to the jurisdiction of the state department of conservation. The public lands are organized into 22 state forests, 71 state parks and recreation areas, 1 national park, 5 national forests which include the 2,948-acre Brady District game refuge, several state game projects, and various other types of development.

Recreation.—This public land together with the dense urban populations of southern Michigan and adjoining states has made recreation one of the principal sources of income within the state. The income from recreation is impossible to measure with accuracy but is estimated variously between \$175,000,000 and \$400,000,000 annually, ranking third behind manufacturing and agriculture. Numerous lakes and streams and an abundance of wooded country attract vaca-

tioners, summer residents, hunters, and fishermen and the income derived from these is of principal importance in northern parts of the state. Good highways furnish access to the recreational areas and the state maintains an active program of research and improvement in forestry, fish and game through its department of conservation.

Points of Interest.—Detroit, the hub of the automobile universe, is also of international interest for its Ambassador Bridge, the longest international suspension bridge in the world, and the Detroit and Windsor Fleetway Tunnel, the only international tube on earth. The Detroit Institute of Arts houses among other things, collections of Italian Gothic sculptures and Dutch and Flemish paintings of special note.

Dearborn, 10 miles west of Detroit, is the home of the Ford Motor Company. Besides the Rouge Plant, there are the Greenfield Village Museum built near the site of Ford's birthplace, the Edison Institute of Technology erected by Ford in honor of his friend, and the Edison Museum.

Cranbrook, 20 miles north of Detroit, in contrast with the industrial center, has won attention for its educational and cultural facilities. Eliel Saarinen, a Finnish-American architect who heads the Academy of Art, is considered one of the country's best authorities on city planning. The statues of Carl Milles, Swedish-American sculptor, are plentiful on the campus of Cranbrook School and the Cranbrook Christ Church contains the work of Johann Kirchmayer, American woodcarver, and Anton Lang, formerly of Oberammergau, Germany.

Mackinac Island, in the Straits of Mackinac, is a quiet place of six square miles where no automobiles are permitted; transportation is entirely by horse and carriage. It was here that John Jacob Astor set up his headquarters for the American Fur Company in 1817. Hundreds of thousands of visitors annually are attracted to this quaint, historic spot.

Marquette, in the Upper Peninsula, is the center of one of the states' all year recreational areas. Sugar Loaf Mountain lies seven miles northwest, and Presque Isle Park is on a small peninsula to the north. The Tahquamenon district on Whitefish Bay is unexcelled in Michigan for fishing.

Isle Royale, lying in the northwestern part of Lake Superior, is Michigan's largest island and the state's first national park. Originally a part of the French dominion, it became a part of the United States in 1783, but was held by the Ojibway Indians until 1842. Evidence of the prehistoric copper mines still remains in several places.

Holland, at the mouth of the Black River on Lake Macatawa, transforms itself the third week in May from a typical midwestern town into a typical Dutch town with its ceremonious Tulip Festival. Dressed in Dutch costumes, the inhabitants, who are 90 per cent of Dutch ancestry, open the celebration by the scrubbing of Eighth Street. The week-long dignified event includes parades, native dances, and colorful tulip exhibits.

Production and Manufactures.—*Agriculture.*—In terms of area, agriculture is the most important land use in the state. The southern half of the Lower Peninsula below the latitude of Saginaw Bay is the most fully developed

agricultural part of the state. Within this area more than 60 per cent of the land is in farms and most of the counties have more than 80 per cent in farms. North of the latitude of Saginaw Bay and in the Upper Peninsula less than 50 per cent of the land is in farms and a smaller proportion of the farm land is cultivated.

All of the state except a small part of the southeastern corner lies within the hay and dairy belt of the United States; Lenawee, Monroe, and Hillsdale counties are included within the corn belt. Over the state as a whole the principal agricultural emphasis is on the production of crops for animal foods and the chief sources of farm income are from dairy products and animals.

The principal field crops on the farms of the state are hay, corn, oats, wheat, beans, fruit, and potatoes. Approximately 19 per cent of the tillable land is occupied by pasture and approximately one per cent by each of the following crops: sugar beets, rye, clover seed, and truck crops.

Specialized cash crops are produced on farms in several parts of the state. Navy and red kidney beans are concentrated in the Saginaw Bay area. Sugar beets are grown in parts of this same area as well as other localities. Potatoes are an important crop in all of the agricultural sections of the state. Concentrations of potato growing are located in the central part of the state and on the light loam soils of Oakland, Macomb, Lapeer and Tuscola counties where the proximity of the Detroit market is a factor in production. Along the Lake Michigan shore of the Lower Peninsula the principal fruit growing area of the state is located. Within a narrow belt the air temperatures from the lake inhibit early budding of trees in spring and likewise prevent early frosts in fall. In the southern part of this belt the principal crops are apples, cherries, peaches, and pears; in the northern, apples and cherries. Grapes are produced in the southern part of the fruit belt and farther inland near the town of Paw Paw. Drained muck lands are utilized for the production of celery, chicory, and peppermint; vegetables are grown on the light soils near to city markets.

Except for cash specialty crops, most of the products of agriculture are used on the farm for animal foods. This emphasis on the livestock phases of agriculture is brought about by the combination of climatic conditions favorable to forage crops, an abundance of land most economically used for pasture, and the presence of large markets for animal products in the industrial cities. Dairy farming is dependent upon rapid transportation of whole milk supplies and of butterfat to the cities.

Fisheries.—The Great Lakes which border the state are sources of considerable amounts of fish of fine quality. The intensity with which commercial fishing is carried on depends partially upon the market prices in effect; between 1,500 and 2,000 men are engaged during the season and the annual value of the catch varies from \$1,500,000 to \$3,000,000.

Lumbering and Forestry.—In its original condition the state was almost completely covered with forests. South of the latitude of Saginaw Bay in the Lower Peninsula they were composed chiefly of the hardwood trees, oak,

hickory, maple, and others. North of the latitude of Saginaw Bay and in the Upper Peninsula the forests were of mixed character, hardwoods, pines, and considerable areas of swamp conifers principally spruce and fir. The southern hardwoods were removed in the process of converting this part of the state to agriculture. Beginning about 1860, large scale lumbering operations cut the pine timber in the northern part of the state. For some years Michigan was the leading lumber producing state of the union. By 1890 most of the pine had been taken, but the lumbering of hardwood timber continued as a major industry until 1915. Approximately half of the area of the state is classified as forest land. In 1945 one third of this was potential lumber and pole producing area and two thirds was deforested or being restocked.

Mineral Extraction.—Michigan has had a long history as a producer of minerals. It was the leading state in copper production until 1887 and in iron production until 1901 and has ranked first or second in salt production for many years. The commercial copper deposits are located in the Upper Peninsula in the Keweenaw area. There is archeological evidence that copper was mined by some prehistoric race prior to the period of the latest North American Indians. Copper mining began in 1845 and for more than 40 years Michigan was the leading producer in the nation. Michigan copper occurs as native metal rather than as an ore and after nearly one hundred years of exploitation the mine shafts are so deep as to make operations very expensive. The low grade, cheaply handled ores in the western states provide copper at less expense than does the native metal of Michigan. During World War II production was stimulated by bounty payments from the government but at present the copper is a marginal resource.

Iron ore is the most valuable mineral product of Michigan. Deposits occur in three localities in the Upper Peninsula; Marquette County, Iron and Dickinson counties, and Gogebic County. Most of the mines are operated by shaft methods in which the ore is mined underground and brought to the surface in cars. It is sent by railroad to docks at Escanaba, Marquette, and to Ashland, Wisconsin, where it is loaded into lake freighters for shipment to manufacturing areas along the lower lakes. Since 1854 the Michigan mines have shipped a tonnage of iron ore equal to the total excavation of the Panama Canal. The reserves were estimated in 1935 to be 162,000,000 tons. The opening of the great strip mines of the Mesabi Range in Minnesota dropped Michigan to second place in iron ore production in 1901 although the greatest shipments from the Michigan mines occurred from 1916 to 1920. The annual production in the state is about one third of that in Minnesota.

Petroleum and natural gas occur in the Saginaw Bay area in Saginaw, Midland, Isabella, Clare, Gladwin, and Ogemaw counties; and in the southwestern part in Allegan and Van Buren counties. There are many other producing locations and the oil bearing structures of the state have not been completely explored. Drilling began in 1886. Petroleum is its second most valuable mineral production but Michigan is not among the leading producers of the United States.

Salt, a third most valuable mineral product,

has made Michigan for many years the leading producer in the United States. Table salt is obtained by evaporating natural brines from wells at Midland, Saginaw, Bay City, Ludington, and Manistee; and by evaporating artificial brines from salt deposits at Detroit, St. Clair, and Port Huron. Rock salt is also obtained at Detroit by deep-shaft mining.

There are extensive deposits of limestone at several places within the state. Of these the most important are located in Alpena and Presque Isle counties. More than half of the Michigan limestone is used for blast furnace flux in the iron and steel industry and for chemical purposes. The location of the Alpena and Presque Isle deposits is of especial importance because they are near the shore and the limestone can be quarried cheaply and shipped by lake freighters engaged in the iron ore commerce.

The Michigan coal basin underlies all or parts of approximately 30 counties in the south central part of the Lower Peninsula. The coal is of relatively low quality bituminous. It is found at many places (but not everywhere within the coal basin) in beds ranging in thickness from five feet to a few inches. Coal has been mined in the state since about 1835 with varying intensity. In 1947 the last operating mine ceased producing.

Other minerals of importance are portland cement, gypsum, and lime. At Midland, the treatment of brines from wells produces quantities of magnesium, bromine and calcium chloride in the production of each of which Michigan is a leading state.

Manufacturing.—In terms of the value of its output, manufacturing is the most important productive enterprise in the state and Michigan ranks fifth in the value of manufactures in the United States. The automobile industry centered in Detroit has attracted and stimulated a great variety of manufacturing establishments both within the city and at other places in the state. Manufacturing is carried on in most of the counties of the southern half of the Lower Peninsula and some of those in the north. There are three general centers: Detroit with its attached and satellite cities, producing automobiles and numerous other products; the Grand Rapids-Muskegon district, producing furniture, household manufactures, engines and light products; and the Battle Creek-Kalamazoo area, producing paper, processed foods, drugs, stoves, and other goods. The development of transportation, especially of highway truck carriers has enabled the automobile industry to extend into these other centers and to draw into the Detroit area some of the production of their factories in the form of parts and semifinished materials. The principal industries in terms of their value are automobiles, parts, and accessories; iron ore; salt, chemical, and other drugs; food products; iron and steel products; furniture; printing and publishing; paper and paper products; and copper.

In its earlier stages manufacturing in the state was based upon the exploitation of natural resources. Mining and lumbering and to a certain extent furniture manufacturing depended upon native materials. The present location and nature of industry must be attributed more to historical causes than to the presence of materials. The location of Michigan in reference to lake transportation and to the population pat-

tern of the United States are factors of importance but other states also share these advantages. The idea of precision manufacturing and mass production of automobiles originated in Detroit and the developments from that idea drew engineers, workmen and equipment to Michigan cities. Automobile manufacturing became the core around which similar and supplementary industries established themselves to utilize the labor supply and technological skill established by the motor industry.

Transportation and Communication.—The southern border of the state lies slightly north of the principal communication lines between the Atlantic coastal cities and those of the Middle West. The industrial importance of Detroit and other southern Michigan cities, however, draws into the state many railroads and highway routes, especially those which pass through Canada, north of Lake Erie, between Buffalo and Detroit. In 1830 construction was begun on Michigan's first railroad, and two years later the line connecting Detroit and St. Joseph was incorporated.

Supplementing this system is a network of trunkline highways, national, state, and county, which have followed in many cases the Indian trails made before the white settlers arrived. The Old Shore Trail, the Canadian Montreal, the St. Joseph, and the Saginaw trails have become 5 of the 16 national highways within the state. The first road, a military highway, was built in 1818. Early transportation was considerably hindered by the large number of settlers traveling westward on the narrow roads. The roads and trails left from the lumbering days in the sparsely settled northern districts of the state even now permit automobiles to be driven almost everywhere.

The location of Michigan on the Great Lakes is strategic in water borne traffic. In 1679 La Salle sailed the first ship, the *Griffon*, up the Detroit River. *Walk-in-the-Water*, the first steamboat in Detroit, appeared in 1818, and in 1825 the opening of the Erie Canal greatly stimulated agriculture and communication with the eastern part of the country. In 1830 a daily boat line began operation between Buffalo and Detroit, and the locks at Sault Ste. Marie, which facilitated the shipment of ore, were completed in 1855. Four fifths of the lake commerce passes through these locks and the tonnage passing through the Detroit River is five times the foreign tonnage of New York harbor. In addition to the bulky cargoes of ore, coal, limestone, and grain, lake commerce carries finished automobiles and other manufactured goods. There are several passenger and excursion lines, and automobile and train ferries operating on the lake. The navigation season is generally from about April 1 until December 1, although the icebreaking train and automobile ferries operate across the Straits of Mackinac throughout the year. Marquette and Escanaba, outlets for iron ore, and Rockport, near Alpena, where limestone is loaded are the principal lake shipping points in the state for these cargoes. The up-bound cargoes, principally coal, are delivered to Detroit, Bay City, Muskegon, and other cities along the lakes. Mackinaw City and St. Ignace are ports for the busy ferry route across the Straits of Mackinac.

Most of the principal air lines of the north-eastern United States stop at Willow Run Air-

port near Detroit and there is regular air service between the major cities of the state.

Economic and Financial Factors.—*Banking.*—Michigan's early banking experiences were unfortunate. In 1837 there were only 15 banks in the state and these had less than \$1,500,000 in actual capital. President Jackson's specie circular (1836) so aggravated the money crisis that a state law was passed permitting wildcat banks with little capital and excessive issues of notes. This law was declared unconstitutional in 1844 and a provision was inserted into the 1850 revision of the constitution providing that no banking law could be enacted without a two-thirds vote in the legislature and approval by a majority of the electors. On Feb. 14, 1932, Gov. William A. Comstock proclaimed a state-wide banking holiday to avoid bank runs following the disclosure of the condition of the Union Guardian Trust Company in Detroit. This action precipitated similar closings over the nation, resulting in the national banking holiday. A state banking department, created in 1937, consisting of a commissioner and his associates, has jurisdiction over and the execution of the state laws relating to banking. It examines banks, defines certain types of investment securities, and licenses small loan agencies. On Dec. 31, 1948, the number of banks, with their assets and deposits were as follows:

Active National banks	78
Assets	\$2,678,872,000
Deposits	\$2,522,901,000
Active State banks	356
Assets	\$2,616,557,000
Deposits	\$2,449,868,000
Other than State or National	12
Assets	\$ 12,132,000
Deposits	\$ 11,487,000

Public Finance and Public Debt.—After its experiences in the panic of 1837, the state government has always maintained a strong fiscal policy, has avoided floating debt, and reduced the public debt. On Nov. 15, 1944, the last of the bonded indebtedness was paid off. In 1947 the state was authorized to borrow up to \$270,000,000 to finance bonuses for resident veterans of World War II. By 1947, \$230,000,000 in bonds had been sold for this purpose. The assessed valuation of real property in 1947 was \$6,366,577,761. At the beginning of the 1947-1948 fiscal year, the state had a balance of \$157,356,760.46. For the year ending in June 1948, the state collected \$781,319,313.52 from all sources; disbursements were \$792,327,246.60; indebtedness was \$219,200,000. The balance at the beginning of the 1948-1949 fiscal year was \$146,348,827.38.

Taxation.—Taxes are mainly derived from a use tax, automobile and gasoline taxes, real and personal property taxes, and a 3 per cent sales tax. The state has no poll or income tax.

Industrial Relations.—During the first fifty years of Michigan history, craft unions were the principal means by which workmen treated with their employers. The ephemeral Knights of Labor, an early attempt at general organization, was the principal labor body in Michigan from 1879 to 1890. In 1885 it won a ten-hour day for the lumbermen in the Saginaw Valley. The American Federation of Labor, a craft union body, became the central organization after 1890. Strikes for improved conditions and higher wages occurred in the Marquette iron range in 1895, in the copper mines in 1910, and

in the Grand Rapids furniture factories in 1911. Automobile manufacturing employs great numbers of unskilled and semiskilled workers and but few artisans or craftsmen, and was therefore poorly suited to craft union organization. Henry Ford's policy of a five-dollar wage for an eight-hour day set a general precedent in the industry. Beginning in 1936 the United Automobile Workers of America, a unit of the Committee for Industrial Organization, conducted a series of sit down and other strikes in the automobile plants and as a result bargaining agreements were signed with most of the corporations. The National Labor Relations Act of 1935 aided the cause of the unions by permitting plant elections for the selection of bargaining organizations. During and following World War II the industrial unions maintained and strengthened their position in industry. Once an "open shop" city, Detroit is now one of the labor centers of the nation and organized workers staff most of the manufacturing plants of the state.

Government.—*Executive.*—Michigan has revised its constitution twice since the original adoption. Under the present revision which went into effect on Jan. 1, 1909, the chief executive officer is the governor, who is elected for a two-year term. The governors have been:

GOVERNORS

UNDER FRENCH DOMINION

Samuel Champlain	1622-1635
M. de Montmagny	1636-1647
M. d'Ailleboud	1648-1650

		1949-

The other executive officers elected to two-year terms are: lieutenant-governor, secretary of state, treasurer, auditor general, attorney general, and superintendent of public instruction. The highway commissioner is elected for four years.

Legislature.—The legislative body consists of a Senate of 32 members and a House of Representatives of 100 members elected for two-year terms. Its membership is reapportioned each ten years on the basis of the national census. A newly elected legislature meets on the first Wednesday in January for an indeterminate session. It may be called into special session by the governor to consider only matters named in his message. All legislation is by bill and to become a law a bill must be passed by a majority of the members elected to both houses and signed by the governor. The governor may veto any bill or any specific item of an appropriation bill within ten days after its presentation by the legislature; a two-thirds majority of each house is required to override a veto.

Courts.—The judicial system is composed of a supreme court, circuit courts, probate courts, justices of the peace and other inferior courts established by the legislature. The supreme court consists of a chief justice and seven associate justices, two elected at each biennial election for eight-year terms. The court holds four terms each year at Lansing. Forty circuit courts, each having one or more judges elected for six years, hold four terms per year in each of the counties within their circuits. Probate judges are elected in each county to four-year terms. Four justices of peace are elected in each township for four-year terms and are qualified to establish courts and hear cases.

Local Government.—In each of the counties, officers are elected to terms of two years or longer. Each county has a board of supervisors to which representatives are elected annually by the townships and which contains representatives of the cities within the counties. The cities are governed by special charters of many forms. Approximately 60 have city manager or commission-manager government.

Public Health.—In 1945, 69 of the counties and 11 cities had full time public health depart-

ments; there were 800 public health nurses and 1,500 industrial nurses in the state. It was estimated that 85 per cent of the population received benefits from city or county health departments or from both. The state department of public health maintains an education section, an engineering service, a laboratory for the benefit of the medical profession, an epidemiology section, a public health nursing section, and a section which compiles records and statistics for the state.

Public Welfare.—The state department of social welfare administers the Old Age Assistance Act whereby state and federal funds are distributed to the aged. This department assists and coordinates the work of the counties and licenses soliciting agencies. It administers restoration and training facilities for the blind; and aid, foster care, and placement for dependent children. Most of the counties maintain infirmaries or homes for the aged and there are many private and local charitable agencies throughout the state. The department of corrections maintains the state prison of southern Michigan at Jackson for adult males, the Michigan State Reformatory at Ionia for males through 25 years of age, the State House of Correction and Branch Prison at Marquette for long term male offenders, and the Cassidy Lake Technical School near Chelsea for youthful first offenders. The Detroit House of Correction, on contractual basis, cares for all female prisoners and the overflow of the males. Hospitals for the mentally ill are located at Kalamazoo, Newberry, Pontiac, Sault Ste. Marie, Traverse City, and Ypsilanti. Wayne County, which includes Detroit, operates a general hospital at Eloise, near Dearborn. A state hospital for the criminally insane is located at Ionia, and another for epileptics near Caro. For mentally deficient residents there are state homes and training schools at Coldwater, Lapeer, and Mount Pleasant, and a similar institution maintained by Wayne County at Northville. There are also the Michigan Employment Institution for the Blind which provides vocational training; the Boys' Vocational School and the Girls' Training School for delinquent children from 12 to 16 years; and Michigan's Children's Institute which acts as a child adoption and placement agency.

Social Legislation.—Child labor laws limit the employment age to 15 years with certificates required for those under 18. Workmen's compensation with full coverage for occupational diseases is in effect. There is social security in the form of an old age assistance law, but no minimum wage standard.

Suffrage.—There is a 6-month state and 20-day district resident requirement, although no minimum length of United States citizenship is necessary. Registration is required.

Education.—Public education follows in general the plan proposed by John D. Pierce, who became its first superintendent of public instruction (1836-1841). The superintendent is elected for a term of two years and has general supervision over elementary and secondary education, both public and private. The state board of education, consisting of the superintendent and three other members elected to terms of six years has supervision over certain state schools, examines textbooks in physiology and hygiene, and grants teachers' certificates. The superin-

tendent and his professional associates are known as the office of education. Education is free for all children five years of age and upwards and is compulsory for all between the ages of seven and sixteen. There are eight four-year public colleges in the state: the University of Michigan at Ann Arbor, governed by its board of regents, a constitutional corporation; Michigan State College at East Lansing, controlled by the state board of agriculture, also a constitutional corporation; Michigan College of Mining and Technology at Houghton, directed by its board of control appointed by the governor with Senate confirmations; four colleges of education at Ypsilanti, Kalamazoo, Mount Pleasant, and Marquette, under the supervision of the state board of education; and Wayne University in Detroit, a part of the Detroit public school system. In 1945 there were 6,029 school districts in the state of which 4,823 maintain one or more elementary schools. 629 of the school districts in the state maintain high schools and ten operate junior colleges. The average pupil enrollment in 1945 in the public schools in the districts was 934,206. There are 20 county normal schools in the state. Among the special and technical private institutions are Detroit College of Law, Detroit Institute of Musical Art, Detroit Institute of Technology, and Lawrence Institute of Technology.

Literacy.—Of the adult population, 28 per cent has finished eight grades, 18 per cent has completed high school and 3 per cent has attended four or more years of college. Only 2 per cent has had no formal education (1945).

Libraries.—Michigan libraries are outstanding in the technical field. Many of the manufacturing companies maintain libraries of considerable size, most of which permit inter-library loans. Among those of importance are the Ford Motor Company in Dearborn, General Motors in Detroit, Parke, Davis and Company in Detroit, and the Dow Chemical Company in Midland. Other libraries include the Michigan State Library at Lansing, established in 1828, with 454,246 volumes specializing in law, genealogy, and local history; the Detroit Public Library with its seven divisions; the library of the University of Michigan at Ann Arbor, strong in governmental problems; and Wayne University whose library is unusual in law, education, public affairs and social work, and pharmacy. The Hackley Public Library at Muskegon is unique in its collections on lumbering and local history.

History.—Indian Period.—The Ottawa and Potawatomie tribes occupied the Lake Michigan shore of the Lower Peninsula and the Ojibway (Chippewa) the Upper Peninsula and some of the northern parts of the Lower Peninsula. In the area between Saginaw Bay and Detroit were the minor tribes, the Hurons, the Sacs, and the Foxes. These tribes lived by garden agriculture, hunting, fishing, and gathering. Their villages were located near water bodies, along the shores of the Great Lakes or on the larger rivers and lakes of the forested interior. Their primitive weapons and techniques were not efficient enough to reduce the supply of game. When white men provided guns and traps and when furs acquired a commercial value the tribes became scattered into smaller groups and families.

French Occupation: 1634-1763.—French explorers, traders and missionaries entered Michigan from Canada and made it a part of the

great fur-producing empire centering on Montreal. Until the discovery of the water connection between Lakes Huron and Erie the route of these explorers was by way of the Ottawa River to Lake Nipissing and over the French River into Georgian Bay. In 1634 Jean Nicolet, an agent of Champlain, then the governor of Canada, passed through the Straits of Mackinac in search for a water passage to the South Seas. However, as early as 1616, traders visited Sault Ste. Marie, and in 1641 the Jesuits, Fathers Raymbault and Jogues, had established a mission there. For seventy years thereafter, the French continued their explorations, spread Christianity, and traded with Indians. They established missions, settlements, and forts to secure the northeastern part of their great line of outposts extending from Canada to New Orleans by way of the Mississippi. The first permanent settlements were made by Fathers Dablon and Marquette; these were at Sault Ste. Marie in 1668 and at Michilimackinac, now Saint Ignace, in 1671. The latter location became the first French military post in the state. In 1701, Antoine de la Mothe Cadillac founded Fort Pontchartrain at the narrows (de troit) of the river connecting Lake Huron with Lake Erie by way of Lake Saint Clair. This fort became the city of Detroit. The French traders lived and worked with the Indians in their villages, gaining their respect and affection. By 1760 the French had lost their foothold and in 1763, the Treaty of Paris transferred to the British all of Canada and the Great Lakes area, but not the loyalties of the Indians.

British Control: 1763-1796.—The British immediately assumed control of the fur trade in Michigan and, like the French, discouraged settlement and restricted land acquisition. The Indians disliked the British and attempted to drive them out of the lake country. Under the leadership of the great Ottawa chief, Pontiac, in 1763, they made simultaneous attacks on the British posts from the Straits of Mackinac to western New York. Detroit was besieged for five months but not taken; most of the other posts were captured and many of the garrisons massacred. The warfare waned as the Indians were forced by the onset of winter to leave for their hunting grounds; the captured posts were retaken by British forces and opposition to their occupation ended. During the Revolutionary War the British posts in Michigan were used as bases for the frontier war against the settlements in Ohio and western Pennsylvania. The Peace of Paris in 1783 ended the "War of the Revolution" but the British were not anxious to relinquish the profitable fur trade. In the absence of effective forces from the new republic to supplant them, they found reasons to remain in the hope that the boundary between the British and American territories would eventually be fixed at the Ohio River rather than through the Great Lakes. In 1787 the garrison at Detroit was strengthened and presents were distributed to the Indians to increase their hostility toward the American settlements. The United States government sent two ineffective expeditions against the Indians, the first in 1790 under Gen. Josiah Harmer and the second in 1791 under Gen. Arthur St. Clair. In 1794 a more powerful force under Gen. Anthony Wayne defeated the Indians and British at the Battle of Fallen Timbers, near the present city

of Toledo, Ohio. This ended the attacks against the settlers and led to the Treaty of Greenville, Ohio on Aug. 3, 1795, by which the Indian tribes ceded to the United States certain parcels of land in Michigan. Jay's Treaty with Great Britain in 1794 required the removal of the British troops from the United States and the garrison of Detroit evacuated the post on July 11, 1796. During the period of British control the original French settlers had remained around the posts; some British merchants had come into Detroit but few persons had been attracted to this remote frontier of Indian trouble and doubtful sovereignty. The white population in 1800 was only 3,206.

Michigan as a Territory: 1805-1837.—The Ordinance of 1787 provided for the organization and government of the Northwest Territory which included Michigan. It stipulated that not less than three or more than five states should be made from the region; provided that a governor and three judges appointed by the president should make the laws under the ordinance and that the three judges should enforce them as the highest court. It contained a guarantee of religious liberty, a bill of rights, a provision for general education, a declaration against human slavery, and the means for erecting new states from the territory. In 1800 the western half of the Lower Peninsula and the eastern part of the Upper Peninsula became a part of the newly formed Territory of Indiana. The remainder of both peninsulas was added in 1802 and on July 1, 1805, the Territory of Michigan was separated from that of Indiana. Detroit was the capital city and William Hull, of Massachusetts, an aging officer of the Revolutionary War, was appointed the first governor. In 1810 there were 4,762 people within the territory of whom 1,650 resided in Detroit.

Governor Hull negotiated the Treaty of Detroit (1807) with the Indians whereby a large section of southeastern Michigan was ceded. The Indians were slow to realize the seriousness of the treaty but under the leadership of the Shawnee brave, Tecumseh, with the help of British agents and fur traders, began to harass the frontier settlements. Hull had insufficient forces to quiet this uprising but Gen. William Henry Harrison defeated the Indians at the Battle of Tippecanoe, near Lafayette, Indiana, on Nov. 7, 1811. The declaration of war against Great Britain on June 18, 1812, found Michigan helpless; the garrisons were meager and Congress had neglected to inform them of the state of war. Tecumseh and his Indians were the ready allies of the British. On July 17 the fort on Mackinac Island was taken without a shot being fired. Governor Hull, who a few months before had been commissioned brigadier general and entrusted with command of the army to protect Michigan Territory, considered this capture to be decisive and, when British forces under Gen. Isaac Brock arrived before Detroit, he surrendered the city on Aug. 16, believing that he had prevented the massacre of its inhabitants. For this act he was severely criticised, court martialed, and sentenced to be shot from which sentence President Madison pardoned him. The surrender of Detroit lost Michigan to the British and permitted their Indian allies to commit outrages against the settlements. On Aug. 23, 1813, following the capture of Frenchtown, on the Raisin River, its garrison was massacred by

the Indians. The United States had constructed a flotilla of ships on Lake Erie which on Sept. 10, 1813, under the command of Lieut. Oliver H. Perry, engaged and defeated British ships near Gibraltar Island; opening the way for troops led by General Harrison to reoccupy Detroit on September 29, and to attack and defeat the British at the Battle of the Thames River in Canada on Oct. 5, 1813. This broke the British hold on Michigan and scattered the Indian allies; Tecumseh was killed on the battlefield and the state was restored. On Oct. 13, 1813, soon after the victory at Thames River, Lewis Cass was appointed as governor of Michigan Territory. He served until 1831 and under his able direction the territory progressed rapidly. He negotiated treaties with the Indians in 1819 and 1821 which transferred to the United States title to almost half of the Lower Peninsula. He also gained from Congress the authorization for five military roads across the state to accommodate settlers who were beginning to arrive in increasing numbers. The end of the Indian troubles and improved travel conditions turned some of the westward migration into Michigan. In 1818 the sale of public land began at Detroit. In the same year steamship navigation was established on the Great Lakes and the opening of the Erie Canal across New York in 1825 gave easy access to Michigan. The population in 1820 was 8,896; in 1830, 31,639; in 1837, 87,273.

The territorial legislature petitioned the Congress in 1834 for permission to form a state. A state convention assembled at Detroit and formulated a constitution. This was ratified by the electorate in 1835 and a complete set of state officers elected. The admission was opposed by southern senators who disliked the formation of another free state, and by Ohio delegates who protested the southern boundary where Michigan and Ohio had been in dispute over the ownership of the strip of land on which Toledo is located. The first of these objections was compromised by promising the admission of Arkansas as a slave state simultaneously with Michigan, and the second by awarding the Toledo strip to Ohio and giving Michigan in compensation the Upper Peninsula which had been up to this time a part of the Territory of Wisconsin. A Convention of Assent to these proposals met in Ann Arbor on Sept. 26, 1836, but would not accept the Toledo Strip compromise issue. In December of 1836 the Democrats assembled another Convention of Assent which accepted the federal proposal, and on Jan. 26, 1837, Michigan was admitted as a state and the officers elected in 1835 continued to serve.

Michigan as a State.—Development of the state was seriously hindered by the financial panic of 1837. An extensive program of internal improvement including the construction of three transpeninsular railroads had to be abandoned. These were assumed by private interests and the Michigan Central Railroad was completed to Chicago in 1852. The state was heavily in debt because of the failure of the eastern companies with whom a \$5,000,000 loan for the improvements had been placed. Settlers were pouring into southern Michigan and taking up land. The southern part of the state was dotted with small towns connected by a net of passable roads built for the most part by local governments. The agricultural settlements extended northward to about the latitude of Sag-

inaw Bay. The discovery and exploitation of copper and iron deposits in the Upper Peninsula led to a demand for a ship canal around the rapids of the St. Marys River, which project was begun in 1853 and completed in 1855. Repeatedly enlarged and improved since that time the Soo Canal is one of the most important waterways in the world. In 1847 the state legislature fixed the location of the capital at Lansing, a city centrally located in the state. A new constitution was adopted in 1850 correcting weaknesses that had become apparent in the original.

During the Civil War, Michigan put nearly 100,000 troops into the field. Among these was Gen. George Armstrong Custer, commander of the Michigan Cavalry Brigade, who later was killed together with his entire column by Sitting Bull's Sioux Indians on the Little Big Horn River in Montana. In 1870 the population passed the million mark; increasing steadily it reached two million in 1890, three million in 1920, and over five million in 1940. Since 1870 the growth has come largely from increases in the urban population. Railroads penetrated the pine lands of the northern parts of the state early in the decade of 1870 and opened this area to large scale lumbering. This brought roads and settlements to the north. Much of the cut-over land was too poor to succeed under agriculture and great areas came into state ownership through tax abandonment. The problems of development and administration of this public domain are chief among those of the state department of conservation. As the lumbering declined at the close of the last century, another and more permanent industry was developing around Detroit. Automobile manufacturing and its associated industries changed that city into a great metropolis, containing within its district more than one third of the population of the state and producing the bulk of the two thirds of the world's automobiles made within the state.

During World War I, Michigan supplied 135,485 troops; in World War II, the state sent nearly 500,000 men and women into the armed services. Equally noteworthy was the contribution of its industries. The manufacturing skill of the automotive plants was utilized for arms production and many new plants were constructed, including the great bomber plant at Willow Run.

CHARLES M. DAVIS,

*Professor of Geography, University of Michigan,
Ann Arbor.*

MICHIGAN, Lake. One of the five Great Lakes, (q.v.), and much the largest body of fresh-water lying wholly within the United States. It extends 335 miles from north to south and throughout most of its length is 60 or more miles wide. Records kept since 1860 disclose an extreme surface variation from 578.3 to 583.4 feet above sea level, with a mean elevation of about 581 feet. At its northeasterly end the lake empties into Lake Huron by the broad Straits of

Mackinac, several miles wide. It has a maximum depth of 870 feet in its northerly portion, lessening to about 200 feet opposite Chicago.

Throughout its southern 200 miles the shoreline is remarkably regular, with no natural harbors. The northern portion of the shoreline is considerably indented, and in this section there are numerous islands and many good harbors. By far the major indentation is Green Bay, over 100 miles long and up to 20 miles wide. The other major indentations are Grand Traverse and Little Traverse bays, on the eastern side of Lake Michigan. The principal island groups are the Fox, the Manitou, and the Beavers, and the chain of islands extending across the entrance of Green Bay. The largest single island is Big Beaver, 14 miles long and upwards of 3 miles broad. In the mid-19th century it was for several years the seat of the fantastic Mormon Kingdom of St. James, whose prophet, James J. Strang, claimed to be the divinely-appointed successor of Joseph Smith as head of the Church of Latter Day Saints.

The Lake Michigan drainage basin is but twice the area of the lake itself, and the numerous rivers that flow into it are necessarily comparatively short. The major rivers are the Fox and the Menominee on the western side of the lake and the Muskegon, Pere Marquette, Grand, and St. Joseph on the eastern side. Sand dunes border the lake for hundreds of miles, especially on its eastern and southern sides. A lake current flows southward on the western side and northward on the eastern, clogging the river mouths with sand and in numerous instances causing the rivers near their outlets to expand into more or less extensive lakes. The harbors throughout the southerly 200 miles of the lake are all artificial, created either by constructing breakwaters in the open lake or by opening and stabilizing the river mouths.

The white discoverer of Lake Michigan was Jean Nicolet in 1634, sent from Quebec by Samuel de Champlain (q.v.) in search of the Oriental kingdom of Marco Polo's narrative. Active French penetration of the upper lakes area, however, was delayed for a generation. Then by an amazing burst of commercial and geographical achievement the entire Great Lakes and Mississippi Valley areas were explored and added to France. Around Lake Michigan flourishing missionary and trading centers were established at such points as Chicago, Green Bay, St. Ignace, and Niles before the close of the 17th century. Until 1763 the country remained wholly French, and the influence of the French occupation is still felt. Although British rule supplanted the French in 1763 and American rule superseded the British in 1796, when the Jay Treaty of 1794 became effective, the region tributary to Lake Michigan remained inaccessible to American settlers until the second quarter of the 19th century. Then such developments as the construction of the Erie Canal and the coming of the steamboat to the Great Lakes and the western rivers produced a flood of settlement which quickly occupied southern Michigan and northern Indiana, and swept onward over northern Illinois and southern Wisconsin. Chicago, a tiny wilderness hamlet in 1830, was the metropolis of the West and one of the wonders of the world a generation later.

Although Lake Michigan is much smaller than Superior and slightly smaller than Huron,

its influence upon the development of the United States has been vastly greater than any of the other Great Lakes. All of them save Michigan lie from east to west upon the northern border of the country. Lake Michigan, 335 miles long, reaches from the relatively sterile pineland of the north to the heart of the richest agricultural area of America. In the period of settlement all overland travel between east and west diverged southward around it, while travelers by water found easy access on it to the heart of the continent. The development of Chicago as the metropolis of interior America and the foremost grain, cattle, and railroad center on earth was inevitable.

Until the close of the 19th century, fishing and the transportation of lumber and grain were important factors in the commerce of Lake Michigan, and during most of the period the volume of passenger travel on the lake was important. By 1850 all save the grain trade had shrunk to insignificant dimensions. In their stead an almost constant procession of huge freighters carries the iron ore of Lake Superior and the Upper Michigan Peninsula downward to the mills which line the southerly shore of Lake Michigan, and coal, grain and other staples in the opposite direction. A development in which Lake Michigan leads the world is the extensive employment of car ferries, by whose use the railroads have in effect leaped the lake from east to west.

With its wealth of forests and fisheries depleted, the northerly shore of Lake Michigan is but sparsely populated and possesses but slight industrial importance. The contrast, both of climate and of industrial development, with the populous and busy southern end of the lake is striking indeed. Nature has provided another marked contact between the eastern and western shores. The prevailing continental wind is from west to east and the vast reservoir of water in Lake Michigan is less susceptible to changes of temperature than is the surrounding land. Thus the lake air conditions the winds that blow over it, absorbing their extremes of summer heat and winter cold and giving the east coast freedom from freezing temperatures in late spring and early autumn. Along practically the entire 300-mile eastern shore, one of the nation's richest fruit belts has developed. Orchards of apples, peaches, plums, and cherries vie with vineyards and fields of berries to claim the attention of visitors and fatten the pocketbooks of those who till the soil. Because of its climatic attractions, too, the entire east coast from the Straits of Mackinac to the Indiana line has become a vast summer playground for the teeming millions of interior America.

The Ordinance of 1787, which created the first American government in the region lying between the Ohio and Mississippi rivers and the Great Lakes, fixed an east and west line through the southern extreme of Lake Michigan as the boundary between the three southern states of the old Northwest Territory (Ohio, Indiana, and Illinois), and the two northern ones (Michigan and Wisconsin). Although the proviso was subsequently violated in every instance, Lake Michigan figured prominently in determining the boundaries of the five states. Both the center of population and the industrial heart of the United States lie close to Lake Michigan's southern end. The wealth of human and material

resources which center here contribute heavily toward making the United States the most powerful country in the world.

MIL0 M. QUAlFE,
Editor, *"The Lakeside Classics Series,"* and
"The American Lakes Series"; author, *"Lake Michigan, and The Flag of the United States."*

MICHIGAN, University of, has had a continuous corporate existence since Aug. 26, 1817 when the "Catholepistemiad, or University, of Michigania" was created by act of the territorial legislature. The name was changed to University of Michigan in 1821. From 1817 to 1837 the institution was in Detroit, but only an elementary school and an academy were conducted under its auspices. When Michigan entered the Union, its first legislature, by an act of March 18, 1837, reorganized the university and created the Board of Regents which is still its governing body. Since 1850 the state constitution has contained provisions for the maintenance of the university, the complete control of its funds and affairs by the regents, and the election of the regents by the people at large. In 1837, by an act of the legislature, dated March 20, the university was located at Ann Arbor. A college building and four "professors' houses" were erected, and the first college class was admitted in 1841. Until 1852 the institution was managed by the regents and faculty, and remained a typical small college of its time. Henry Philip Tappan, who was its first president (1852-1863), however, conceiving that a university should offer complete facilities for study in all recognized fields, greatly strengthened it, paying particular attention to scientific studies. President Tappan was succeeded by Erastus Otis Haven (1863-1869) and James Burrill Angell (1871-1909). Dr. Angell, one of the great educational leaders of his time, added to the institution's prestige by a further expansion. The administration of his successor, Harry Burns Hutchins (1909-1920), was notable for the establishment of an effective nationwide alumni association. Marion LeRoy Burton's brief period (1920-1925) as president, brought a much-needed increase in state appropriations. After the acting presidency of Alfred Henry Lloyd and the administration of Clarence Cook Little (1925-1929), Alexander Grant Ruthven came to the chair in 1929. His administration proved to be another period of expansion in enrollment, which doubled, in the erection of buildings, especially those comprising the residence halls system, and in the value of endowment funds. The university consists of 14 schools and colleges, organized in the years named, although many had existed previously: literature, science and the arts, 1841; medical, 1849; law, 1859; dentistry, 1875; pharmacy, 1876; engineering, 1895; graduate school, 1912; architecture, 1913; education, 1921; business administration, 1924; forestry and conservation, 1927; music, 1929; nursing, 1940; public health, 1941. There are also many museums, and summer camps for special studies.

FRANK E. ROBBINS,
Assistant to the President.

The university lands, buildings, and equipment are valued at \$86,000,000. Some of the finest buildings were provided by gift, notably the Law Quadrangle group, erected by the late William W. Cook, the Rackham Building which houses the Graduate School in Ann Arbor, and the Rackham Educational Memorial, the extension

center in Detroit, both given by the Horace H. Rackham and Mary A. Rackham Fund, and the Michigan Union and Michigan League, student social centers provided by alumni contributions.

MICHIGAN CITY, city, Indiana, LaPorte County, altitude 625 feet, on Lake Michigan, 35 miles west of South Bend, on the Michigan Central; Pere Marquette; Chicago, Indianapolis and Louisville; Nickel Plate; Chicago South Shore and South Bend (electric) railroads. The city is a diversified industrial center and has foundries and railroad shops; manufactures of railroad cars, mining machinery, heating apparatus, boilers, metal furniture, bicycles, underwear, pants, gloves, wire specialties, and numerous other products. It has a good harbor and yacht basin, and has developed a large vacation resort business. The Indiana State Prison is located here. At the edge of the city are the International Friendship Gardens, a permanent exposition of the flower gardens of the world, covering 100 acres of rolling land where Father Marquette preached to the Potawatomi Indians in 1675. The spring mentioned in his diary is near the entrance to the gardens. Settled in 1832, the town was incorporated as a city in 1836. It has a mayor and council. Pop. (1950) 28,395.

MICHIGAN COLLEGE OF MINING AND TECHNOLOGY, Houghton, Mich., was founded in 1885 and opened in 1886. Originally the Michigan Mining School, later the Michigan College of Mines, its present name and scope date from 1927. It is state supported. The bachelor of science degree is given in engineering, and the master of science degree in chemistry and in chemical, civil, geological, electrical, mechanical, metallurgical, and mining engineering. The college maintains a branch at Sault Sainte Marie where the first two years of technical education are given.

The college has a short wave radio station, and uses field trips extensively in teaching. It has a substantial student loan fund and generous scholarship provisions, including grants to foreign students. Engineer and air units of the Reserve Officers' Training Corps (ROTC) have been organized on the campus. The yearly enrollment is approximately 1,500 students.

MICHIGAN STATE COLLEGE OF AGRICULTURE AND APPLIED SCIENCE, East Lansing, Mich., was established by an act of the state legislature passed in 1855. The present site (then consisting of 676½ acres) was purchased, and on May 13, 1857 Michigan Agricultural College was dedicated, the first state institution in the United States to offer instruction in scientific and practical agriculture. Since then it has grown to occupy 3,000 acres in its campus and farms at East Lansing, and 4,625 acres in experimental station grounds at other points in the state. The name was changed in 1925.

The college has the following divisions. the two-year Basic College, and schools of agriculture, business and public service, engineering, home economics, science and arts, veterinary medicine, graduate studies, and a division of extension work. The degrees given are bachelor of arts, bachelor of science, bachelor of medicine, doctor of veterinary medicine, master of arts, doctor of philosophy.

Michigan State College Press was established in 1947, and the college also has a radio station. Kellogg Center for Continuing Education, a \$2,000,000 building largely financed by a grant from the Kellogg Foundation, was opened in 1951 as a forward step in adult education. Most of its programs are designed to help the thousands of Michigan residents who come to the college each year for special courses and conferences to improve their vocational abilities and everyday living. The center also serves as a working laboratory for students of hotel and restaurant management at the college. Scholarship provisions are liberal, and there is a large loan fund for student aid. Army Reserve Officers' Training Corps (ROTC) units provide military training. The annual enrollment is about 14,000 students.

MICHILIMACKINAC. See MACKINAC ISLAND.

MICHIPICOTEN, mīsh-ī-pī-kō't'n, a bay, island and river in the western part of the province of Ontario, in Canada. The bay is an arm of Lake Superior, on the northeast shore, about 100 miles north of Sault Sainte Marie. At the entrance to the bay is Michipicoten Island. The river has its source in lakes on the south side of the height of land dividing the waters of Hudson Bay and Lake Superior and falls into the bay 125 miles north of Sault Sainte Marie.

MICHLER'S KETONE, mīk'lēr's kē'tōn. Tetramethyldiaminobenzophenone $(\text{CH}_3)_4\text{N}_2\text{C}_6\text{H}_4\text{COC}_6\text{H}_4\text{N}(\text{CH}_3)_4$, was first prepared in 1876 by Wilhelm T. Michler (1846-1889). He obtained the ketone by passing carbonyl chloride into cooled dimethyl aniline. The reaction mixture was then heated with water and the product was purified by treatment with hydrochloric acid and caustic soda. With slight modifications Michler's method is employed at the present time for the preparation of the compound. The ketone has also been prepared (1) by heating hexamethyl-triaminotriphenyl carbinol with hydrochloric acid, and (2) by heating a mixture of dimethyl-aminobenzanilide and dimethyl aniline in the presence of a small quantity of phosphorus oxychloride, and by decomposing the condensation product with an acid at slightly elevated temperatures.

Michler's ketone forms bright grayish plates when crystallized from alcohol. It melts at 179° Centigrade and boils with decomposition above 360° Centigrade. It has been used to a great extent in the manufacture of certain dyes. Thus heated with dimethyl aniline and phosphorus oxychloride it yields crystal violet; with ammonium chloride in the presence of a dehydrating agent it forms auramine; it condenses with phenyl-alphanaphthylamine into Victoria blue B; with methyl-phenyl-alphanaphthylamine into Victoria blue 4R, and with ethyl-alphanaphthylamine into Victoria blue R. It also forms dyes with dioxy-naphthalenes and with pyrogallallic acid.

V. S. BABASINIAN,
Professor of Chemistry, Lehigh University.

MICHMASH, mīk'māsh (modern מִיכְמָשׁ, mōōk-mās'), town, Palestine, seven miles northeast of Jerusalem. It occupies an important strategical position, commanding the north side of the Pass of Michmash, on one of the two an-

cient caravan roads from Jerusalem to Mount Ephraim. It was here that the Philistines made their headquarters in their movements against the first uprising under Saul, and it was the scene of Jonathan's exploit related in 1 Samuel xiv. It was also Jonathan's headquarters in the time of the Hasmonaeans (1 Macc. ix, 73). The present village, Mukhmas, is small, and the road on which it stands is more or less abandoned in favor of the caravan road which keeps to the high ground and avoids the Pass of Michmash.

MICHOCAN, mē-chō-ā-kān', Mexico, a state, on the Pacific Ocean, bounded on the north by the states of Guanajuato and Jalisco, on the east by Mexico, on the south by Guerrero and the Pacific and on the west by the Pacific, Colima and Jalisco. Area, 23,200 square miles. The surface generally is mountainous; in the north and south are some flat lands. The volcano of Jorullo is in the southwest. The largest drainage streams are Las Balsas and Lerma on the boundary, and the Tepalcatepec. There are a number of lakes within the state limits, the largest of which is Cuitzeo. Except where the lands are low, the climate is healthful. The soil is fertile; the principal crops are sugar, tobacco, vanilla, wheat, rice and tropical fruits. Considerable attention is given to stock-raising. The minerals are valuable. The Don Estrellas mine is the largest producer of gold and silver in the country. The capital is Morelia (q.v.). Pop. of state 1,166,000.

MICKIEWICZ, mēt-kyē'vèch, Adam Bernard, Polish poet: b. Novogrudok, Lithuania, Dec. 24, 1798; d. Constantinople, Nov. 26, 1855. He was educated at the University of Wilno, where he became affiliated with several of the leaders against Russian control. His first volume of poems appeared in 1822 and stamped him the greatest poet of his country. Implication in political affairs caused his banishment to Russia in 1824, but in 1828 permission to leave Russia was granted him and he traveled in Germany and Italy, and in 1834 he went to Paris, where, in 1840, he became professor of Slavonic languages and literature in the Collège de France, where his radical teaching led to his suspension in 1844. In 1848 he attempted to enlist Polish regiments for service in the Italian struggle with Austria. He became librarian at the Arsenal in Paris in 1852. His remains were interred (1890) at Cracow. (See PAN TADEUSZ). Among his works are *Conrad H'allenrod* (1818); *Crimean Sonnets* (1826); *The Books of the Polish People and of the Polish Pilgrimage* (1832); *Pan Tadeusz* (1834), etc.

Consult L. de Loménie, *Galerie des Contemporaines*, and Gardner, W. M. *Adam Mickiewicz, National Poet of Poland* (1911).

MICKLE, mīk'l, William Julius, Scottish poet: b. Langholm, Dumfriesshire, Scotland, Sept. 28, 1735; d. Forest Hill, near Oxford, Oct. 28, 1788. He removed to London in 1763, and in 1775 appeared his principal production, a translation of the *Lusiad* of Camoens. His poetical works were published collectively, in 1807. Among the best of Mickle's poems is the ballad of Cummor Hall, which has attained additional celebrity as having suggested to Sir Walter Scott the groundwork of his novel of *Kenilworth*. The popular song, *There's nae Luck about the Hoose*,

has been claimed for him; others ascribe it to Jean Adams (1710-1765), schoolmistress near Greenock.

MICMACS, mīk'mäks, a tribe of American Indians.

MICROBE, a microscopic organism; applied particularly to bacteria, and more especially to the forms that cause disease. See also BACTERIA; PROTOZOA.

MICROBIOLOGY, the science dealing with the structure, classification, physiology, and distribution of microorganisms, and with their technical and medical significance. The term microorganism is applied to the unicellular and structurally closely related simple representatives of the plant and animal kingdoms. With few exceptions, the unicellular organisms are invisible to the naked eye and generally have dimensions between a fraction of a micron and 200 microns (1 micron = 1/25,400 inch). They were discovered by the Dutch microscopist Anton van Leeuwenhoek in 1676. Certain complex large organisms, such as mushroom-forming Fungi, are so closely related to the microscopic forms that they are considered part of the same group.

Principal Types of Microorganisms.—In its broadest sense, microbiology deals with the biology of the Protozoa, the Algae, the Fungi, the Bacteria, the *Rickettsiae*, and the viruses.

Protozoa.—These are unicellular organisms generally placed in the animal kingdom, although some of the photosynthetic species are, with equal justification, often considered to be plants (green Algae). Since the more primitive representatives of the Protozoa are probably closely related to the common ancestors of both the higher animals and the higher plants, their allocation to either kingdom is purely arbitrary. Some of the more complex members of the group show a remarkable degree of differentiation of special structures within the cell for purposes of locomotion, nutrition, and excretion. All Protozoa have distinct nuclei and generally reproduce by cell division. Many exhibit a sexual process known as conjugation, which is analogous to the sexual phenomena in higher plants and animals. The nutrition of the Protozoa is varied: some are holophytic and lead a plant-like existence; others are holozoic and prey on other microorganisms; a few are parasitic.

Algae.—Although the more complex Algae, such as the seaweeds, are not generally considered to be microbiological material, the microscopic, unicellular and simply organized, filamentous and colonial types have been studied advantageously with microbiological methods. Such simple forms are found mainly among the green Algae (Chlorophyceae), the yellow Algae (Chrysophyceae), and the blue-green Algae (Cyanophyceae). In general, the Algae have a photosynthetic mode of nutrition and produce cell material and oxygen from carbon dioxide and water. The energy used in this process is derived from sunlight, which is absorbed by the green plant pigments known as chlorophylls. Most Algae have a distinct nucleus and show sexual behavior as well as cell division. Unlike other Algae, the blue-green Algae do not have chloroplasts and are not known to have a sexual cycle. Their nucleus is not distinct, although nucleus-like bodies have been shown to be pres-

ent. If they are motile, the blue-green Algae have a creeping movement and never swim by whip-like processes known as flagella, which occur in other Algae and some Protozoa. In addition to chlorophyll, they contain a blue pigment, phycocyanine, which gives them their characteristic color.

Fungi.—The true Fungi, which, like the Algae, are generally considered to be primitive plants, differ from the Algae in being non-photosynthetic and in not depositing cellulose in their cell walls. This group includes the yeasts, the molds, the rusts, the mushrooms, and related organisms. True Fungi possess distinct nuclei and, with some exceptions, a sexual reproductive mechanism. The yeasts are unicellular Fungi and generally reproduce by budding or fission, while the molds are filamentous (mycelial) organisms, which often show a certain degree of differentiation of the various portions of the plant body (mycelium) into special sexual or asexual reproductive structures. Being incapable of photosynthesis, the Fungi are saprophytic or parasitic in their nutrition.

Bacteria.—The Bacteria, or Schizomycetes, which are usually classified as a group of Fungi, differ from most of the true Fungi in being smaller and simpler in structure. No sexual reproduction comparable to that found in the true Fungi has been proved for Bacteria. Although nucleus-like bodies have been demonstrated in many Bacteria, their nature and behavior have not been entirely established, perhaps mainly because of their small size. While most Bacteria are saprophytic or parasitic, like the true Fungi, some are photosynthetic. Bacterial photosyntheses, however, differ from green plant photosynthesis in that oxygen is never produced and in that the bacterial chlorophylls, which are diffused in the cells, differ slightly both in chemical structure and in absorption spectrum from green plant chlorophylls. Bacteria are unicellular or mycelial in structure and may be either rigid or flexible. Many possess a swimming motility, generally achieved by flagella, while some show a creeping motility similar to that of the blue-green Algae. In general, the group known as Bacteria appears to be a somewhat heterogeneous and poorly defined collection of organisms, some of which may be more closely related to the blue-green Algae than to Fungi. Because of the small size, the lack of distinct characters, the absence of sexuality, and the variability of Bacteria, their classification is difficult and admittedly unsound.

Rickettsiae.—These are small, bacterium-like organisms, which are found as parasites in arthropods and occasionally in warm-blooded animals. They are obligately parasitic and, while they can be grown in living tissues, they do not generally yield to cultivation in lifeless, artificial media.

Viruses.—The filterable viruses are the smallest known entities possessing certain characteristics of living organisms. They pass through bacteriological filters which retain Bacteria and *Rickettsiae*. The viruses are obligately parasitic in the tissues of plants or animals and cannot be grown in lifeless artificial media. While the larger viruses may well be thought of as organisms, some of the smaller ones can be crystallized and appear to be nucleoprotein molecules or aggregates.

Microbiological Methods.—The success of experimental laboratory work and of the medical and large-scale industrial applications of micro-

biology is based mainly on the techniques of sterilization, aseptic manipulation, and propagation of pure cultures.

Sterilization.—This is the complete destruction of all germs in an environment or in a medium wherein microorganisms are cultivated. This is usually accomplished by prolonged exposure to dry heat (160° to 180° C. for 90 to 150 minutes) or to steam under pressure (15 to 20 pounds pressure from 15 to 60 minutes).

Aseptic Technique.—This implies the manipulation of sterile media and pure cultures without their contamination with foreign germs, which are present everywhere in soil and water, on the human body, and on dust particles in the air. Protection against dust is commonly effected by the use of sterile cotton plugs, which act as air filters, and by the use of a gas flame, with which dust particles are burned before they can enter sterilized receptacles.

Pure Cultures.—These are populations of cells derived from the multiplication of a single cell of a microorganism and, therefore, the progeny of one individual. They are usually obtained by the isolation of individual cells on a sterile, nutrient, solid medium, on which their progenies accumulate as segregated masses, known as colonies.

Physiology and Nutrition of Microorganisms.—Because of their availability and their enormous rates of growth and metabolism, the microorganisms have served as excellent material for studies of nutrition and physiology. Some of the greatest contributions to the understanding of the physiology and biochemistry of higher plants and animals have come from experiments on yeasts, unicellular Algae, and Bacteria. The Fungi, and particularly the Bacteria, which occur in a great variety of natural habitats, exhibit a remarkable multiplicity of nutritional requirements and physiological processes. The autotrophic organisms are those which can grow in entirely inorganic environments, synthesizing their cell material from carbon dioxide and inorganic salts, such as nitrates, sulphates, phosphates, etc. The photoautotrophs use the radiant energy of sunlight as a source of energy for their life processes. Thus, the Algae carry out the type of photosynthesis characteristic of all green plants, while the green and the purple sulphur Bacteria make their organic compounds by the reduction of carbon dioxide with hydrogen sulphide or sulphur. The chemoautotrophic or chemosynthetic organisms are also capable of growing in environments containing only inorganic compounds, but do not possess chlorophylls and are incapable of photosynthesis. They derive their energy from energy-yielding oxidation-reduction reactions involving inorganic compounds. The colorless sulphur Bacteria use oxygen to oxidize sulphides to sulphur, which they store in the cells and which they subsequently oxidize to sulphates. Some nitrifying Bacteria obtain their energy from the aerobic oxidation of ammonia to nitrites, while others oxidize nitrites to nitrates. The hydrogen Bacteria can oxidize molecular hydrogen to water, while the iron bacteria, which are found in iron springs, oxidize ferrous iron salts to ferric hydroxide, which they deposit outside the cell body.

The heterotrophic organisms use organic compounds in their nutrition and are, therefore, ultimately dependent on the autotrophs for their livelihood. They obtain organic compounds either

as saprophytes, by decomposing dead organisms or the waste products of living ones, or as parasites or symbionts living in or with other living organisms. Certain Bacteria are photoheterotrophic, using organic compounds in their nutrition, but obtaining their energy from sunlight. All the Fungi and most of the Bacteria, on the other hand, are chemoheterotrophic. They depend on organic nutrients as a source of carbon for making protoplasm and obtain their energy from oxidation-reduction reactions involving organic compounds. Some chemoheterotrophs can grow with a single organic compound, while others need more than one. Many Protozoa, Fungi, and Bacteria require minute amounts of special organic compounds, known as nutrilites, for growth. These compounds are in many cases identical with the vitamins needed by higher animals.

Aerobic or respiratory organisms obtain their energy by oxidizing organic compounds with molecular oxygen. While complete oxidation leads to the production of carbon dioxide, incomplete oxidations may lead to partially oxidized products. The vinegar Bacteria, for instance, transform alcohol into acetic acid. While many organisms require air, many others can use anaerobic oxidations as a source of energy. The obligate anaerobes are restricted to this type of metabolism and are inhibited or even killed by contact with air. Anaerobic oxidations involve oxidizing agents other than oxygen. Thus, some Bacteria oxidize organic compounds with nitrates, which they reduce to nitrites, nitrogen gas, or ammonia. Others use sulphates as oxidizing agents and produce sulphides. Still others can oxidize organic compounds with carbon dioxide, which they reduce to methane, or marsh gas. Fermentations are oxidation-reduction reactions involving only organic compounds or portions of organic compounds. The products of fermentation vary with different organisms and include such compounds as ethyl and butyl alcohol; formic, acetic, propionic, butyric, and caproic acids; lactic acid; acetone; glycerine; carbon dioxide; hydrogen gas; etc.

Significance of Microorganisms and Practical Applications of Microbiology.—The universal distribution and the varied physiological activities of microorganisms make them extremely important in the economy of nature. It is estimated that about 90 per cent of the decomposition of organic compounds, which is necessary for the continuation of plant and animal life, is carried out by microbes. In soil and in water microorganisms are responsible for the transformations of carbon and nitrogen compounds, through which the fertility of the soil and, indirectly, the composition of the earth's atmosphere are maintained. (See BACTERIA AND BACTERIOLOGY.)

The variety of technological uses to which microorganisms are put is enormous. In brewing and baking, the alcohol and carbon dioxide produced in fermentation by yeasts are utilized. Bacterial fermentations are used industrially to produce organic acids and solvents. In food manufacture, microorganisms are used for the production of vinegar, the preservation of olives, sauerkraut, and pickles, for the souring of cream in making butter, for the ripening of cheese, and for the curing of tea and tobacco. The control of undesirable microorganisms is the principal aim of canning, pasteurization, and other methods of preservation of food.

Since Protozoa, Fungi, Bacteria, *Rickettsiae*, and viruses are the causes of almost all infectious diseases of plants and animals, the control of these parasitic microorganisms is one of the main aspects of both preventive and therapeutic medicine. The sciences of pathology, immunology, and epidemiology are concerned with the medical aspects of the microbes in their relation to the hosts which they invade.

Certain microorganisms produce antibiotic substances which are destructive of or inhibitory to other microbes. Some of these substances have great therapeutic value in the treatment of disease and are produced on a large commercial scale. Of the many antibiotics which have been described, the most important are the penicillins, which are produced by Fungi, and the bacterial antibiotics, streptomycin and tyrothricin. See also BACTERIA AND BACTERIOLOGY; FUNGI; PROTOZOA; YEAST.

MICHAEL DOUDOROFF,
Associate Professor of Bacteriology, University
of California.

MICROCEPHALUS, mī-křô-sef'á-lūs, in *pathology*, the condition of having an abnormally small head, further marked by a peculiarly shaped cranium. The forehead is small and receding and the vertex somewhat pointed. The condition results in mental deficiency, amounting in some cases to idiocy.

MICROCLINE, mī'krô-klin, a feldspar identical in composition with orthoclase, but crystallizing in the triclinic system. Thin sections examined in polarized light frequently show a grating-like structure, due to double twinning. The color varies from white to yellow and, occasionally, red or green.

MICROCONODON, mī-křô-kôn'ô-dôn, a fossil animal of the Upper Trias in North America, doubtfully placed among the Protodonta, or most primitive of Mammalia, and of interest chiefly in reference to the structure of its teeth as indicating the subsequently developed mammalian type.

Consult Osborn, *Evolution of Mammalian Molar Teeth* (New York 1907).

MICROCOSM, mī'krô-kôz'm, AND **MACROCOSM**, māk'rô-kôz'm. Among the ancients a belief prevailed that the world or cosmos was animated, or had a soul. This theory led to the notion that the parts and members of organic beings must have their counterparts in the members of the cosmos. The natural philosophers of the 16th century took up this theory in a somewhat modified shape, and considered the world as a human organism on the large scale, and man as a world, or cosmos, in miniature; hence they called man a microcosm (Greek, "little world") and the universe itself the macrocosm ("great world"). Heylin gave the title *Microcosmus* to a work on cosmography in 1621.

MICROLESTES. See *PLAGIAULACIDÆ*.

MICROMETER, mī-krōm'ē-tēr, the name given to various instruments for the measurement of minute angles and distances and used by astronomers, engineers and mechanics. As used by astronomers the device is commonly called the double image micrometer and is an eyepiece containing two halves of a lens, each half being movable by a screw in a direction parallel to the common diameter. In making an observation of the diameter of a heavenly body, the half lenses are moved so that the image formed on one half lens coincides with the image on the other. In engineering the micrometer scale is attached to the transit. In mechanics the micrometer takes the form of a caliper or gage with a micrometric screw which registers measurements as fine as .0001 of an inch.

MICRON, mī'krōn (Gr *mikros*, small), a unit of length equal to the millionth part of a meter, or the 25,400th part of an inch. The Greek letter μ is used as its symbol. Thus 47 μ is read "47 microns."

MICRONESIA, mī-krō-nē'zhī-ā (Gr. *mikros*, small; *nēsos*, island), designation of one of the three great divisions of the Pacific Islands (see OCEANIA), located north and west, respectively, of Melanesia and Polynesia (qq.v.). These groups of small islands are situated between the equator and latitude 20° N.; and from west to east between longitude 130° and 180° E. The designation "little islands" aptly describes their physical appearance, for they are generally small and generally low, and Micronesia contains a larger proportion of islands of the atoll type than any other area on the globe of comparable extent.

In general, the islands lie outside the hurricane belt, yet at rare intervals they are visited by destructive gales of this type. Precipitation is generally low and the supply of water is markedly deficient, in some islands the only potable water being that which is obtained by filtration through the beach sand into wells dug above high water mark. However, despite the infrequency of rain, all of the islands may be regarded as fertile and abundantly productive, and the excessive temperature is pleasantly moderated by the prevalence of ocean breezes. Production includes bananas, breadfruit, coconut, taro, sweet potatoes, and yams. The major groups of islands comprising Micronesia are the Caroline Islands, Marianas (Ladrone) Islands, Marshall Islands, and the Gilbert Islands, the last being politically part of the (British) Gilbert and Ellice Islands colony. The Carolines and Marianas were acquired by Spain, who later sold them to Germany (with the exception of Guam, in the latter group, which was ceded to the United States). Germany annexed the Marshalls, only to lose all three groups after World War I, when they became a Japanese mandate; in turn, the United States captured them in World War II and continued to hold them in trust for the United Nations.

Nauru and Ocean are two detached islands of Micronesia lying almost on the equator, both of considerable economic importance because of rich deposits of phosphates. Nauru is a mandate of the British Empire administered by Australia, and Ocean is the capital of the Gilbert and Ellice

Islands colony. Micronesians of the Gilbert Islands were settled in Gardner, Sydney, and Hull, three of the uninhabited eight atolls constituting the Phoenix Islands (geographically within Polynesia), when that group was incorporated in the colony in 1937.

Micronesians originally came from southeastern Asia, in the course of their migration being affected by the racial and cultural influences of the lands through which they passed. Thus they acquired affinities of blood and speech with Indonesians, Filipinos, and Papuans, and bear many resemblances to the Polynesians and Melanesians (qq.v.). As a general type, the Micronesians are long headed, copper colored, slender, short in stature, and straight haired. While a great many distinct dialects are in use, they have generally a common grammatical structure with an elaborate verb system. The local forms of dress and equipment, the semidivine status of the chiefs, and the veneration of stone pillars (sometimes stone circled) are reminiscent of a megalithic domination.

MICROPHONE, mī'krō-fōn, a device which converts sound energy into electrical energy. Microphones may be classified according to their principle of operation into the following categories: carbon-button; condenser; crystal; dynamic or moving-coil; and the velocity or ribbon type.

The carbon-button microphone has as its principle of operation the change of an electrical resistance with sound pressure. The variable resistance element is a cylindrical "button" containing minute carbon particles. One end of this button is mounted against a diaphragm, which vibrates in accordance with the sound waves striking it. This motion causes the density, and hence the aggregate resistance of the carbon particles in the button, to change. A source of direct current is connected across the button, so that when sound strikes the microphone the current flowing in the circuit will be varied accordingly.

The carbon-button type is a relatively sensitive microphone. On the other hand, its quality of reproduction of sound is relatively poor. It also possesses a characteristic background hiss due to random motion of the carbon granules. For these reasons, the carbon-button microphone is used where transfer of information with minimum amplifying equipment, but not necessarily high-quality reproduction, is desired.

A condenser microphone depends for its operation upon the change of electrical capacitance with sound pressure. The diaphragm acts as one plate of a variable condenser. This condenser is connected in series with a high-resistance and direct-current source. When the diaphragm vibrates in accordance with sound striking it, the change in capacitance causes an alternating component of current to flow.

This type of microphone is characterized by a very small output, about one hundredth that of the carbon-button type. For this reason an amplifier stage is often built into the microphone stand. It does, however, have good reproduction fidelity and stability. Hence it is often used for sound measurements.

The crystal microphone utilizes the piezoelectric effect of Rochelle salt crystals to convert mechanical stress produced by sound waves into electrical energy. The voltage thus generated is

taken off from a pair of electrodes between which the crystal is mounted. The crystal microphone requires no external source of voltage or current.

This type of microphone has relatively low output, but good fidelity. The crystal element is temperature-sensitive, the sensitivity dropping rapidly at temperatures above 90°F.

The dynamic or moving-coil microphone, as the name implies, generates a current in the coil as it moves back and forth in a magnetic field. The coil is attached to a diaphragm which the sound waves cause to vibrate. The magnetic field is usually produced by a permanent magnet. Like the crystal microphone, this type requires no external source of power. A small permanent-magnet loud-speaker can be used as a dynamic microphone, although the reproduction quality is not as good as that obtained with a properly designed microphone.

The velocity or ribbon microphone is a special form of the moving-coil microphone, in which the coil consists of a thin metallic ribbon suspended between the poles of a magnet. The ribbon is acted upon directly by the sound waves, so that no additional diaphragm is used.

This type possesses a pronounced directional response property; that is, it responds to sounds coming only from certain directions. This directivity can be taken advantage of to minimize undesired noises and room characteristics. It has very good reproduction fidelity.

E. S. LINCOLN.

MICROPHOTOGRAPH. A minute photograph of a large object. Sometimes it is incorrectly employed as the equivalent of photograph (q.v.).

MICROSCOPE, *mī'krō-scōp*, an optical instrument by means of which images of objects are so magnified that details invisible to the naked eye are clearly discerned. The basic principle making this possible lies in supplementing the lens system of the human eye by the use of external positive (that is, magnifying) lenses. (See also LENS.)

The normal human eye is able to change the focal length of its lens system from infinity to an average minimum of 10 inches. The apparent size of an object being determined by the angle which it subtends to the eye, whatever that angle is at a distance of 10 inches represents unity of magnification. Should the object be moved to five inches from the eye it would automatically be magnified two times but appear blurred. By interposing a lens of five-inches focal length between it and the eye, the image can be made sharp and twice as large as at 10 inches. At one inch from the eye the angle subtended would be substantially 10 times that at 10 inches and here again it can be put in perfect focus with a one-inch lens. Therefore any single positive lens having a focus of less than 10 inches will enlarge an object, the amount of magnification being equal to 10 divided by the focal length of the lens. The image in this case is called a *virtual* image. Lenses employed in this way are simple microscopes, commonly known as magnifying glasses. Fig. 1 shows diagrammatically the path of the light rays in the case of a simple magnifying lens.

A one-inch lens will also project a *real* image of an illuminated object on a screen. With the screen located on the side of the lens having the longer of the conjugate foci, when the latter

are in the ratio of 10 to 1 the image will be 10 times the size of the object. This principle is made use of in the compound microscope, which essentially represents a two-stage magnification. For this there must be a double set of lenses. The first, the objective, projects a *real* image into the microscope tube where, if a ground glass screen were interposed, it could be observed. However, it is not necessary for an actual screen to be present; the image exists in space as an *aerial* image, but is nevertheless *real*.

FIG. 1. In this diagram, *e* is the eye, looking at an object *a-b* through a simple double-convex lens *c-d*. Limiting rays from the extremity of the object are bent by the lens to enter the eye, which sees them as though coming from the enlarged dotted image located in space.

Then the second magnifying lens system, the eyepiece (or ocular), picks up this image, projecting it into the eye as a *virtual* image. The path of the rays in this compound system is shown in Fig. 2, in which *a-b* represents the object and *c-d* its real image as formed by the objective *g-h*. The eyepiece, consisting of two planoconvex lenses, *i-l* (the field lens) and *o-p* (the eye lens), spaced apart with a limiting diaphragm located in the plane *c-d*, serves as a lens to produce a virtual image in the eye. Rays from it cross above the eye lens at the Ramsden circle

FIG. 2.

and can project a real image on a screen. The inverted virtual eye image is seen as though it existed in space at $e-f$.

It will be evident that the total magnification of a compound microscope equals the magnification of the objective times that of the eyepiece. Actually a third factor enters the equation, the distance from the optical center of the objective to its projected image where it is picked up by the eyepiece. The normal 10-inch (250 millimeter) distance of best vision is the standard against which the magnification of the optical components must be compared. As pointed out, a one-inch lens on this basis gives a magnification of 10 times, a $\frac{1}{2}$ -inch lens 20 times, and so on. But this is true only when its image is formed at a distance of 10 inches. Microscopes were formerly designed with a 10-inch tube length, but this results in an unwieldy instrument; hence a mechanical tube length of 160 millimeters has been adopted as standard by the majority of manufacturers. Thus the formula for final magnification with a 16-mm. objective and 25-mm. ocular is:

$$\frac{250}{16} (\text{objective}) \times \frac{160}{250} (\text{tube length}) \times \frac{250}{25} (\text{ocular}) = 100\times$$

Modern objectives are designated in millimeters, supplemented by their magnification computed for 160-mm. tube length. They range from 50 mm. to 1.5 mm. The commonly employed lenses are 10x (16 mm.), 40x (4 mm.), and 90x (2 mm.). Oculars are marked with magnification only, 5x, 10x, and so on.

So far it has been assumed that objectives are simple lenses. Actually this cannot be so, since lenses with spherical surfaces possess inherent defects which render their performance entirely unsatisfactory in that they do not form perfect images. Chief of these defects are spherical and chromatic aberrations. The former results from the fact that the peripheral portion of a lens magnifies more than the central portion. Chromatic aberration is due to a variation in lenses in their refractive index for different wave lengths of light. Short waves (blue) are refracted more than long ones (red), hence a lens possesses a different focal length for each color of the spectrum. Fortunately, different kinds of glass possess not only different refractive indices but different degrees of dispersion; hence, by properly combining positive and negative lenses made from high index (flint) and low index (crown) glass of varying degrees of dispersion, it is possible to eliminate both types of aberration to a great degree, and also to deal with other defects to which glass lenses are subject. Such corrected lenses are called achromatic and are employed for all types of optical instruments. Low-power microscope objectives have but two glass elements, but as the power goes up more complex combinations are required. There may be as many as ten or more elements in the highest type of oil immersion objectives. For the most critical work a still more highly corrected objective, known as apochromatic, is available. These are extremely high-priced, hence not ordinarily supplied as regular equipment.

While magnification is an essential requirement in objectives, the degree of resolution obtained at any given magnification depends on another characteristic of lenses. It is known as

numerical aperture (N.A.), a value derived from the angular aperture of a lens and the refractive index of the medium through which light reaches the objective. The formula is: $N.A. = n \times \sin U$; n being the refractive index, which in the case of air equals 1. U is one half the angular aperture. The sine of U cannot exceed 1.00 with lenses in air, hence the N.A. must be less than 1.00, but by designing high-power lenses so oil with an index of 1.515 can be used between the object and the lens, the N.A. can be as high as 1.40. To obtain the utmost an objective is capable of producing, it is essential that an object be illuminated from below with a condensing lens having an N.A. equal to that of the objective. By means of an iris diaphragm it can be adjusted to fit any objective.

Stand.—The essential parts of a microscope (Fig. 3) apart from the optics are—the base,

(I) Mirror. (J) Coarse focusing mechanism (knob not shown). (K) Arm. (L) Fine focusing mechanism (knob not shown). (M) Base.

supporting the entire instrument; the stage, upon which the object (usually mounted on a glass slide) is supported; the tube carrying the objective and ocular; the arm, or handle support, on which the tube is mounted; and coarse and fine focusing means for raising and lowering the tube. Under the stage are located the substage, carrying the condenser, and the mirror for directing the light into the lens system. A usual accessory is the nosepiece, a turret for mounting several objectives for quick interchange. More elaborate instruments are equipped with binocular eyepieces, a great convenience for reducing eye strain during long periods of use. Finally, a mechanical stage for accurate control of the object being examined is an important accessory. All but inexpensive models are provided with an inclination joint allowing the tube to be inclined or used in a horizontal position when required.

Numerous applications of the microscope in science and industry involve the use of various modifications in design to adapt it to specific uses. The simpler models intended for schools and student use omit all but the bare essentials. Biological and medical instruments come next, ranging from medium-priced models to the highest refinements of research types. For chemical and petrographic purposes very special equipment is required—a graduated revolving stage; polarizer and analyzer for polarized light; a Bertrand lens which can be inserted into the tube above the analyzer for viewing interference figures; and various other optical accessories which can be inserted in a slot in the tube as required. Microscopes for metallurgical use require a vertical illuminator located above the objective for projecting light down on the specimen, since all metals must be studied with top illumination. Another practical microscope for low-power work is the Greenough binocular, employing paired objectives and paired eyepieces, with Porro prisms for erecting the image, which is always inverted in other microscopes. Other types of microscopes for special purposes include the ultramicroscope for viewing colloidal particles in a light beam at right angles to the optic axis, and ultraviolet microscopes which require quartz optics and illumination with monochromatic light in the ultraviolet range.

Recent developments along microscopical lines include phase microscopes, which are equipped with special condensers and objectives for producing contrast in living and unstained objects having refractive indices close to that of the substance in which they are mounted; and the radical departure from glass optics in the electron microscope. This instrument substitutes electromagnetic focusing of high-frequency cathode rays for glass lenses and visible light. With it, magnifications from 10,000 to 100,000 diameters, with perfect resolution, are possible. The image is either photographed or picked up on a fluorescent screen.

History.—The origin of simple magnifying glasses is shrouded in antiquity. References to them occur in the literature of nearly 2,000 years ago, and lenses of glass and quartz have been found in the ruins of Nineveh, Pompeii, and other localities. It was not until about the year 1600 A.D. that the compound microscope was born. In all probability the first ones were made by two Hollanders (father and son), Hans and Zacharias Janssen. Almost simultaneously others, Cornelis Drebbel (1572–1633), Franciscus Fontana (fl. c.1646) and Galileo Galilei produced similar instruments. No work of note was done with these early models and it was not until about a half a century later that Anton van Leeuwenhoek in the Netherlands and Robert Hooke in England began to do constructive work with instruments of their own design. That of the former was not strictly a compound microscope since he did all his work with very powerful minute spherical lenses.

Other names associated with the development of the microscope between the years 1660 and 1720 were Eustachio Divini (fl. 1648–1670) and Filippo Buonanni (1638–1725). It is interesting to note, in the light of recent developments in microscope objective construction that Sir Isaac Newton suggested in 1672 the use of a concave spherical reflector in combination with an eyepiece to eliminate chromatic and spherical aber-

rations. Johann Nathanael Lieberkühn's (1711–1756) invention of the solar microscope about 1740–1750, using the sun as a source of illumination, enabled him to project enlarged images in a darkened room. With the advent of more powerful light sources this form of microscope became obsolete. Since all these early microscopes were equipped with uncorrected lenses, they were limited in both magnification and performance.

It was not until after 1776, when Leonhard Euler (1707–1783) discovered the way to make achromatic lenses, that the microscope began to take its proper place as a research instrument. The names of Joseph von Fraunhofer (1787–1826), Augustin Jean Fresnel (1788–1827), Sir William Herschel (1738–1822), Giovanni Battista Amici (1786?–1863), Joseph Jackson Lister (1786–1869), Charles Luis Chevalier (1804–1850), and others, are associated with subsequent developments of the microscope. In 1840 Amici introduced the first immersion objective, marking a great advance in high-power work. In 1872 Ernst Abbe (1840–1905) produced his two-lens condenser and a new series of homogeneous immersion objectives. His work on the theoretical optics of the microscope, culminating in the production of apochromatic objectives, marks the greatest single contribution ever made to the microscope.

In the United States important contributions to objective design were made by Robert B. Tolles (1825?–1883), William Wales (fl. 1875–1885), Charles Albert Spencer (1813–1881), and others. Much of the credit for mechanical innovations goes to the optical firms of Zeiss, Leitz, Reichert, Hartnack, Koriska, and others on the continent; Watson, Baker, Beck, and Powell & Lealand in England; and Zentmayer, Gundlach, Spencer, and Bausch & Lomb in the United States. Several of these firms no longer exist, but played their part when the microscope was still young.

More recent developments include the electron microscope, phase microscopy, and objectives utilizing the principle first suggested by Sir Isaac Newton, which has been mentioned above. See also MICROSCOPY.

ROY MORRIS ALLEN.

MICROSCOPIUM, mī-krō-skō'pī-ūm, in astronomy, one of the 14 constellations which Nicolas Louis de Lacaille (1713–1762) added to the heavens in connection with his work at the Cape of Good Hope. It is south of Capricornus and is a very inconspicuous constellation, its brightest star being of only 5.1 magnitude.

MICROSCOPY, mī-krōs'kō-pī; mī'krō-skō-pī, the practical application of the microscope in the various fields in which it is employed. In the broadest sense, it includes a knowledge of the instrument itself in theory and practice; familiarity with the various techniques of preparing objects for study under the microscope in its numerous applications; and the interpretation of what is seen under the microscope, the specimens having been suitably prepared. Probably no other scientific instrument can rank with the microscope in its practical value to mankind. Without it we would know nothing about vital

human processes and structures, the nature of reproduction, blood and tissues, the nature and causes of disease, bacteria and viruses, the minute forms of plant and animal life, or the structure of metals and rocks; in fact every phase of modern life and progress owes a debt to the microscope. The fields wherein it is an absolute essential include biology, histology, hematology, clinical pathology, bacteriology, parasitology, metallography, mineralogy, petrology, crystallography, chemistry, foods, and forensic problems.

General Techniques.—Because the microscope is involved only in the study of minute objects, it is essential that all material to be examined under it be suitably prepared for the purpose. The exception to this is the case of examination by means of the low-power Greenough binocular microscope which provides erect stereoscopic images of relatively large objects. This type of instrument is of great value in examining rocks and minerals, metal and paint surfaces, fabrics, coins, postage stamps, printed matter, writings, signatures, and the like. For other microscopical work the examination is done largely by means of transmitted light. With most materials this involves either the making of thin sections or reducing to small-particle size in various ways. The materials can then be mounted in a suitable mounting medium on glass slides.

Glass slides are usually three inches long and one inch wide and about 1.5 millimeters thick, although other sizes are employed for specific purposes. Since objectives are corrected for use with a cover glass (.18 millimeter thick) between them and the object, a cover glass must always be used for best results when working with dry lenses. Oil immersion lenses do not require cover glasses since the oil can be a substitute. Only slides intended for permanent record and future study require detailed consideration.

Living tissues, plant and animal, involve an elaborate technique to prepare them for mounting. The fresh, still living, material must first be killed rapidly and fixed before post-mortem changes can occur. Various chemicals are employed for this purpose, the most common being 10 per cent formalin, acting for several hours. This is followed by washing in water, slow dehydration through several changes of alcohol, replacing the latter with xylol or a similar solvent, and the final embedding in paraffin just above its melting point. When the paraffin has completely infiltrated the tissue, the latter is cast within a block of solid paraffin. It is now ready to be mounted on the microtome (q.v.) and sectioned, usually about 5 to 10 microns thick. As sections are cut, the paraffin causes them to adhere together in proper sequence forming a long ribbon. Sections from this ribbon are mounted on glass slides, the paraffin is dissolved out, leaving the sections adhering to the slide. They are then suitably stained, washed, dehydrated, cleared with xylol, and mounted in balsam. Such a slide constitutes a permanent object for study under the microscope and future reference. This process is employed for pathological tissues (cancer and other diseases), normal histological tissues, both plant and animal, and all soft objects requiring support during sectioning. Other modified methods are in use, such as embedding in celloidin when harder tissues are involved.

In some cases it is desirable to examine tissues separated into individual cell components. These are treated with a solution to soften the intercellular substances, then teased out with needles. The cells can then be stained and mounted. Tissues containing water must be dehydrated using the procedure previously described. This applies to all objects which would be damaged if allowed to dry. Such include objects like infusoria, parasitic worms, fecal matter containing eggs, minute insect larvae which can be mounted whole, and others of similar nature.

Some materials can be dried directly on a slide as a thin smear. Among these are blood, bacteria, sputum, yeast cells, and minute plant and animal life occurring in stagnant water. When dry these are fixed to the slide by heat or alcohol, stained, and mounted in balsam.

Staining.—Staining of plant and animal tissues is necessary since unstained objects are usually transparent and have a refractive index close to that of the mounting media used. Also, since different tissues and cell contents possess affinities for different stains it is possible to differentiate them with two or more colors in the same section. The stains commonly used include aniline colors, acid, basic, and neutral; vegetable and animal dyes; and metallic impregnation with gold or silver. Staining methods are often quite complex, but when carefully done yield beautiful results.

Clinical Microscopy.—In no other field are the varied microscopical techniques employed to the extent required by the study of disease. Examination of pathological tissues, blood, intestinal parasites, urine, feces, bacteria, insect carriers of disease and the manner of their transmission, with many other problems call for the utmost in manipulative technique. One procedure, limited almost exclusively to this field is the examination of neoplastic tissues while a patient is still on the operating table, to determine the nature of the growth and the degree of malignancy. Since time does not permit the employment of standard embedding and staining processes, tissues must be sectioned by freezing. Special carbon dioxide freezing devices attached to the microtome will harden a tissue for sectioning within a few minutes. Then with a quick stain, a diagnosis can be made at once.

Petrology.—The study of rocks and minerals by means of thin transparent sections is a specialized type of microscopy not only in that the work must be done with microscopes designed for the purpose, but also because the technique of preparing material for examination is different. Sections cannot be cut with a microtome; they must be ground to the proper thickness, usually about 30 microns. Briefly the procedure involves slicing the material in a diamond-charged metal saw to a thickness of one to two millimeters; grinding one side smooth and flat on a glass or metal plate charged with carborundum and water; then cementing it to a slide with hard balsam or other cement. The section is then ground down to the desired thickness, removed from the slide and remounted on a fresh one, and covered with a cover glass. If the material is soft and friable, it must be left on the slide on which it has been ground since it would disintegrate if removed.

Special knowledge is required in the study of rocks and minerals, including the nature and use of polarized light and the optical characteristics

of minerals. The technique of preparing petrographic slides, however, is of value in some biological work, e.g., bone, teeth, calcareous secretions, and the like.

Metallography.—The study of metals is another phase of microscopy requiring a special technique. In this case examination is done on suitably prepared flat surfaces which must be illuminated from above. The surface to be studied must be flat and represent non-distorted metal. To produce this condition, grinding and polishing must be done in stages on carborundum papers of increasing fineness, the scratches from one grade being removed by the next finer until a surface is obtained which can be polished on wet cloth wheels charged with polishing powder that gives a mirror finish free of scratches. Then this surface is etched with a suitable acid adapted to the metal or alloy to be examined.

Microscopes designed for metallographic work do not require substage equipment, mirror, or condenser, but must have a vertical illuminator located above the objective. Light is projected into this illuminator from above and deflected downward by a mirror through the objective, which thus serves as a condenser, onto the metal surface. This illuminated surface is studied and interpreted by means of the differential etching of the various constituents present. Since no cover glass is used in the study of metals, special objectives corrected for use without them must be used. These objectives are also designed with shorter mountings to minimize glare.

Photomicrography.—The key fact in taking photographs through a microscope is that a compound microscope as a whole functions as a single magnifying lens, in that it produces a virtual image in the eye and a real image on the screen. With the screen located 10 inches from the eyepoint the magnification is identical to that seen by the eye, at 20 inches it will be twice as great, and so on. A slight change in the focus is necessary when changing from eye focus to projection.

Photomicrography, therefore, requires only the addition of a camera, without lens (the microscope becoming the lens), and a powerful light source. For best results these should be so mounted with respect to each other, after proper alignment, that they can not easily be disturbed. While a fixed focus camera can be used, one with an adjustable long bellows is preferable since the magnification is then variable with a given combination of lenses. Also the camera should allow the image to be seen and focused on a ground glass screen. The microscope can be either in its vertical position with the camera above it, or turned to the horizontal position with the camera also horizontal. The latter is more desirable for several reasons—it eliminates the mirror which must be used in the vertical position, it allows the use of a mounting board on which the complete apparatus can be placed, and it makes easy the proper alignment of lamp, microscope, and camera. Easy means for moving the camera out of the way for eye examination is essential; also some type of optical bench located between the light and microscope, on which accessories such as shutter, filter holder, and polarizer can be placed when needed. A collimating lens in front of the lamp for focusing the light into the microscope is an important accessory.

For many objects the use of light filters is required. The practical minimum of these would

be red, green, blue, light yellow, and orange. They are used for reducing or intensifying contrast as desired, depending on the colors in the object. Also the use of panchromatic plates or films is necessary when red is a dominant color in the object. For best results one should have a practical knowledge of the optical principles of the microscope and of photographic processes.

Probably the greatest problem involved is the exposure time, since this depends on so many factors: (1) the intensity of the light; (2) the speed of the film used; (3) the magnification on the screen; (4) the speed factor of the filter necessary; (5) the numerical aperture of the objective; (6) the amount the condenser diaphragm is closed beyond that point where its aperture equals that of the objective; and (7) the nature of the object being photographed. The best procedure is to determine by repeated trial the correct exposure under one set of definite conditions; then the effect of variables can be computed for other combinations. Exposure time varies as the square of the magnification; inversely as the square of the numerical aperture of the objective (see MICROSCOPE); directly as the filter factors (data supplied by the manufacturer). But only experience will guide as to the density of the object, the relative intensity of the image on the ground glass screen serving as a measure.

Although the objective alone will project an image, it should never be used without an ocular (eyepiece) since it produces a perfect image only at the computed optical tube length. With an ocular, the projection distance is not a serious factor. Photomicrographs can be taken either in black and white or color film or by any standard color process.

ROY MORRIS ALLEN.

MICROTOME, mī'krō-tōm, an instrument designed for cutting thin sections of plant and animal tissues for study under the microscope by means of transmitted light. It may be small and of simple design or very large with extremely complex mechanisms, but the principle is the same in all. The three essential parts are: a means for supporting rigidly the tissue material to be cut; a knife honed to razor sharpness, also rigidly held in the proper position for making the cut, and movable across the tissue in the plane of the cut; and means for advancing the position of the knife with respect to the tissue a definite, predetermined, and uniform amount for each cut.

Since the microscope, especially when high magnifications are involved, possesses a very minute depth of focus, and also because some materials are relatively opaque, it is essential that a microtome be able to cut sections within the range of useful thickness. The more elaborate instruments are usually susceptible of ad-

justment to cut any desired thickness between 1 and 60 microns (a micron is approximately 1/25,000 of an inch). The usual thickness employed for histological and pathological tissues is from 5 to 10 microns. Advances in the use of the electron microscope for studying sections has required refinements in the design of microtomes for this purpose so as to make it cut as thin as 1/10 of a micron (1/250,000 of an inch).

Microtomes may be grouped into three types—simple hand models, sliding microtomes, and rotary microtomes. In the sliding types the object being cut is usually stationary, the knife moving horizontally over it on sliding tracks. Rotary microtomes have a vertical stationary knife with the object moving up and down across it. In both types the object is advanced after each cut to give the desired thickness. For the technique of preparing specimens for sectioning and mounting see MICROSCOPY.

ROY MORRIS ALLEN.

MIDAS, mī'dās, in Greek myth, a king of Phrygia, proverbial for his golden touch and for his ass's ears. The gift of the golden touch came from Bacchus, whose follower, Silenus, Midas rescued and treated kindly; in return Bacchus offered him any wish he would name and Midas asked that all that he touched should be turned into gold. When he found that food and drink became gold at the touch of his lips, Midas besought Bacchus to take back the gift; some stories say he was sent to bathe in the river Pactolus, which ever after was full of gold-bearing sand. His ass's ears were given Midas by Apollo to punish the king for declaring Pan's pipe more musical than Apollo's lyre. Hence "ears of Midas" is a phrase used of ignorant critics. Midas' barber discovered the king's secret deformity and whispered it into a hole in the ground, where reeds grew up whispering the story in the wind.

MIDAS, a genus of marmosets (q.v.).

MIDDELBURG, mīd'l-būrg, commune, the Netherlands, capital of the Province of Zeeland, on the island of Walcheren, 4½ miles northeast of Flushing. Middelburg was a medieval Hanse town, and one of the leading mercantile cities of the United Provinces, sending many ships to the East and West Indies, and the Levant. Its former commercial importance, however, has declined, being now confined chiefly to a coasting and domestic trade. Pop. (1947) 20,605.

MIDDLE AGES, *The*, a period of history supposed to extend from the fall of the Roman Empire in the 5th century to about the year 1550, covering from 10 to 11 centuries. The Middle Ages embrace that period of history in which the feudal system was established and developed, down to the most prominent events which necessarily led to its overthrow, though its consequences and influences are still very observable in the states of Europe. The first centuries of the Middle Ages are often termed the Dark Ages (q.v.). Still, the destruction of Roman institutions by the irruption of barbarous tribes is often unduly lamented, and the beneficial consequences attending it overlooked. True it is that many of the acquisitions which had cost mankind ages of toil and labor were lost in the general wreck, and only regained by the efforts

of many successive generations; the flowers of civilization were trampled underfoot by barbarous warriors; the civil development of society suffered a most severe shock; those nations to which Roman civilization had extended previous to the great invasion of the Teutonic tribes were thrown back in a great measure to their primeval barbarism, and the unruly passion for individual independence greatly retarded the development of public and private law, and in some countries has entirely prevented a regular civil constitution. So also the most remarkable institution of that time, its characteristic production—chivalry—exhibited all the peculiarities of the corporations. War was the profession of the nobles. No one of their order who was not a knight could bear a lance or command cavalry. The weak side of the Middle Ages is the scientific. Physical science was still in a very crude state, and the lack of the proper apparatus necessary for its accurate pursuit was a serious handicap. Considering, however, the inefficient means then at hand, the knowledge attained, though of course rude, inaccurate and often mere guessing, was greater than is popularly supposed. The efforts of Charlemagne in the 8th century to encourage science and instruct the people laid the foundations for a more thorough and systematic training, which culminated in the great schools of scholasticism of the 12th and 13th centuries. The process was slow and often retarded by the unsettled social and political conditions that prevailed through this period. The 14th and 15th centuries witnessed a rapid and brilliant development finding its apogee in the Renaissance movement. See HISTORY, MEDIAEVAL.

MIDDLE EAST, the region situated mainly in southwest Asia and northern Africa, predominantly Moslem in religion, which may be broadly described as forming the bridge between the continents of Europe, Asia, and Africa. For the purposes of this series of articles, the term Middle East includes the following political units:

(1) *In Europe*: Greece (with Crete) and Turkey in Europe.

(2) *In southwest Asia* (bordered by the Soviet Union, China at Kashmir, and India): Turkey in Asia; the Mediterranean island of Cyprus; Syria; Lebanon; Israel; Jordan (comprising former Transjordan and non-Israeli Palestine); the countries of the Arabian Peninsula—namely Saudi Arabia, Yemen, Aden and Aden Protectorate, Masqat (Muscat) and Oman, Trucial Oman, Qatar (Katar), Kuwait, and the adjacent Bahrain Islands; Iraq (Persia); Afghanistan; and western Pakistan.

(3) *In Africa*: Morocco, Algeria, Tunisia, Libya, Egypt, and the Sudan.

From a strategic point of view, the Ethiopian Plateau and the lands generally east of it to the Red Sea, the Gulf of Aden, and the Indian Ocean—namely Ethiopia, Eritrea, British and French Somaliland, and Somaliland (former Italian Somaliland)—could be included in the Middle East, but are here excluded because of their many divergencies from the rest of the region.

From a religious point of view, the Middle East thus comprises, primarily, the predominantly Moslem countries of southwest Asia and of Africa; but it also includes the Christian-Moslem state of Lebanon and the Jewish state of Israel, both of which are geographically inseparable from the rest of the region, as well as

the nearby island of Cyprus, which is predominately Christian. Greece, a Christian state, is a part of the Middle East, both in view of the widespread Hellenistic civilization of the pre-Moslem period and the role played by Greece in the maritime affairs of the eastern Mediterranean.

The term Middle East as here used replaces other terms for parts of the same region. All of what is generally considered as comprising the "Near East" is included, except the Balkan states north of Greece, which were included in the "Near East" by some authorities before World War I. Also included is the "Levant," a general term for the eastern Mediterranean region from western Greece to western Egypt, meaning, as does "Anatolia," the land where the sun rises.

Also consult *The Middle East: a Political and Economic Survey*, Royal Institute of International Affairs (London 1950).

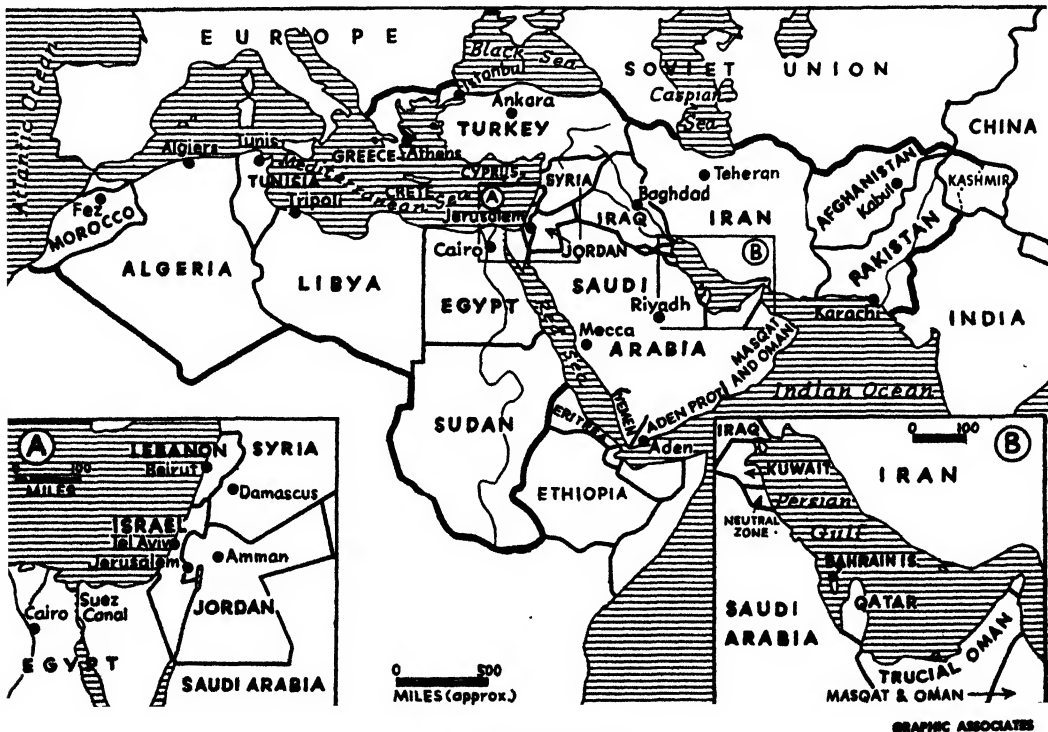

Under the following headings will be found an authoritative treatment of the Middle East, its geostrategic and economic importance, its historical, political, social, and cultural aspects:

1. DELIMITATION OF THE MIDDLE EAST. The terms "Near East" and "Middle East" have had different meanings at various times and places. The old and for centuries the prevailing term had been that of "Near East," taken from the geographical viewpoint of the western European countries, particularly those bordering on the Atlantic and the western Mediterranean, such as Great Britain, Portugal, Spain, Holland, France, and the Italian city states, dealing commercially and politically with the Near East. This term was also accepted by the three great landpowers driving toward the Near East and the Mediterranean from the northeast and northwest: Russia, Austria, and Germany.

All of this Near East was included in the Ottoman Empire in the 16th century during the height of its power—an area as large as the United States of America of today, spreading into the three continents of south Europe, west Asia, and north Africa, and connecting the Atlantic and Indian oceans, and through the latter, the Pacific Ocean. In today's terms that empire embraced in Europe: parts of Austria and Hungary and all of the five Balkan states; in Asia: all of the seven Arab states, plus Israel, the British protectorates of the Arabian Peninsula, parts of Persia (Iran), and six Soviet Russian states; in Africa: all the countries of that continent's Mediterranean littoral, including Egypt, Libya, Tunisia, Algeria, and Morocco; in the Mediterranean Sea: all the strategic islands, except Malta, as

THE MIDDLE EAST

The delimitations of the Middle East area as defined in this article are shown on the map above. The southeastern corner of the Mediterranean Sea is shown in greater detail in inset A; the Persian Gulf area, in inset B.

well as the strategic waterways leading from the Mediterranean to the Atlantic and the Indian oceans.

The disintegration of the Ottoman Empire, ending in final dissolution following World War I, covered a period of about a century and a half. During that time, all issues arising between the empire and the competing European powers were called questions of the Near East (see EASTERN QUESTION). More than a score of national states grew out of this gradual dissolution of the Ottoman Empire.

During the historic evolution of the Balkan states toward their nationhood, the Balkan Peninsula (q.v.) was taken out of the Near East delimitation and referred to as "South East Europe." At the same time, Europe used the term "Middle East" for the area between the Ottoman Near East and the Far East, comprising such non-Mediterranean countries as Persia (Iran), Afghanistan, and India.

In the United States, also, the two terms have been used in different ways. E. A. Speiser's book on *The United States and the Near East* (1947) designates as "Near East" only the area of the Arab League, Palestine, and Israel, without even Turkey. For the American Oriental Society, Iran together with Iraq constitutes the Middle East. The U.S. State Department's Division of Research for the Near East and Africa covers Africa (except Algeria and the Union of South Africa), Greece, Turkey, the Arab lands, Iran, Afghanistan, Pakistan, India, Burma, and Ceylon; while a special section deals with the immediate neighbors of the USSR—Greece, Turkey, and Iran. The *Middle East Journal* in Washington declares in its editorial foreword (1946) that "its attention will be centered on the heart of the area: Turkey, Iran, Iraq, Syria, Lebanon, Palestine, Transjordan, the Arab Peninsula and Egypt, but not without due reference to closely related peripheral areas, such as the Mediterranean approaches—North and East Africa; in addition, Transcaucasia, Afghanistan, India, and Turkestan." The Middle East Supply Center of joint American, British, and at times Soviet Russian cooperation from 1941 to 1946 included in Asia: Syria, Lebanon, Palestine, Transjordan, Iraq, Saudi Arabia, the Arab sheikhdoms, Aden, Iran, and Turkey; in Africa: Egypt, the Sudan and Ethiopia, Eritrea and Somaliland, Tripolitania and Cyrenaica; and in the Mediterranean: Cyprus and Malta; but it excluded Turkey because of the accident of its neutrality.

A subcommittee of the United Nations has also dealt with the question as to what countries comprise the Middle East (in 1948 on May 24 and 25 and on June 1), and has arrived at the following delimitation: Greece, Turkey, Iran, and Afghanistan, the seven states of the Arab League, and Ethiopia. For this region, a United Nations Commission was established to permit its economic development. On June 14, 1948, Pakistan applied for membership and was admitted. At the same time, neighboring Soviet Russia's claim to membership was rejected.

The American use of the term "Middle East," borrowed from the British, appears to have practically superseded the older European term "Near East," and British Prime Minister Attlee stated in the House of Commons in 1950: "It has become the accepted practice to use the term 'Middle East' to cover the Arab world and cer-

tain neighboring countries. This practice seems to me convenient and I see no reason to change it." However, the most proper term for the whole area in question would be "Near and Middle East," which has been accepted by Columbia University for its Near and Middle East Institute. This organization commenced with a minimum program covering Greece, Turkey, Iran, Afghanistan, the Arab countries (including the North African coast of the Mediterranean), and Israel. In view of the geographic and religious affinity of the Near and Middle East to the Moslems in India, the state of Pakistan was included.

The seeming differences in the use of the terms "Near" and "Middle" East will be understood if one approaches the issue from various aspects of geography, strategy and communications, politics and economics. From all these angles, the Near and Middle East offers a unique situation in ancient as well as in modern times, with varying emphasis on one or any part of the whole Near and Middle East area.

ERNEST JACKH,
Columbia University.

2. STATISTICAL HIGHLIGHTS. Immediately to the south of the Soviet power bloc is a band of small but important nations whose common bond is that of resistance to the Soviet expansion southward. No other unifying principle connects these diverse states, as is proved by the statistical analyses which follow, and tensions among neighboring members of this regional grouping are strong. In these lands were located all the great early civilizations—Egypt, Sumer, Babylonia, and the Indus Valley—and many of their successors—Phoenicia, Greece, Assyria, and Persia—as well as such outlying peoples as the Hittites, the Mitannians, and the Hebrews. Nearly all human inventions were originated by Near Eastern peoples, including statistics itself, but their descendants have neglected this study. Consequently, the following figures vary widely in precision and must be considered as approximations, with conclusions drawn therefrom remaining necessarily somewhat tentative.

Government.—Politically the Near and Middle East area includes several nations which have imitated, more or less successfully, the institutions of Western democracy. Nominal republics include Turkey, Syria, Lebanon, Israel, and Pakistan; constitutional monarchies are Greece, Egypt, Iraq, and Iran. An older form of monarchy, with the ruler limited by custom and religious law, is found in Afghanistan, Jordan, Saudi Arabia, and the Yemen; while sheikhs under British protection rule in Aden Protectorate, Masqat and Oman, Trucial Oman, Qatar, Bahrain, and Kuwait. Aden and Cyprus are British colonies; Jerusalem is theoretically under United Nations administration. And the small neutral zones northeast of Saudi Arabia are under the undivided joint rule of that nation and Iraq or Kuwait.

The westward extension of this region, excluded from the following statistics unless specifically mentioned, includes a condominium in the Anglo-Egyptian Sudan, a United Nations trusteeship in Libya, within which are a Senusi tribal state under British guidance in Cyrenaica and a French regime in the Fezzan oases, a French protectorate in Tunisia, a government-

general of France in Algeria, and a sultanate in Morocco divided into a French protectorate, two Spanish zones, five Spanish-owned cities, and the international zone of Tangier.

Religion.—The political diversity is matched by the religious. Though the area is normally considered Moslem, other religions are well represented. Greece is 98 per cent Christian, Cyprus 82 per cent, and Lebanon 54 per cent, while significant Christian minorities are located in Syria and the North African countries. Jews comprise 93 per cent of the inhabitants of Israel and a majority in Jerusalem, and are scattered throughout the East, where they were accepted without prejudice until resentment against Zionism aroused hostility. A 10 per cent Hindu admixture complicates Pakistan's situation, but these Hindus are concentrated in Bengal outside the area presently in review. Finally, the southern Sudan is inhabited by animistic Negroes, who constitute 20 per cent of the total population.

Within the Moslem community similar divergence is found. Shi'ites dominate Iran (93 per cent) and the Yemen, and are more or less evenly matched with orthodox Sunnites in Iraq (57 per cent) and the Persian Gulf sheikhdoms and in the Moslem part of Lebanon. Saudi Arabia is controlled by the puritanical Wahhabis. Syria is an intricate mixture of Sunnites, Shi'ites, Nusayri and Druse (Druze) pseudo-Moslems, Yezidis, Maronite and other Christians, and a tiny remnant of Samaritans. Pakistan's minorities include Brahmins, Parsis (Parsees), Sikhs, Jains, and Isma'ili followers of the Aga Khan, whose origins go back to the Assassins of crusading times.

Although most of the territory historically under Moslem rule, except Spain and the Balkans, is included in this region, four of the five major Islamic powers of the 20th century are excluded: 69 million Moslems in the Republic of Indonesia lead Pakistan's 66 million for world priority, while India's 34 million, China's 23 million, and over 20 million in the USSR all exceed the highest figures west of Pakistan, that is, Turkey's 19 million, Egypt's 18 million, and Iran's 16 million. Thus it is clear that numerically the center of Islam is located far to the east of its origins in Mecca, although pilgrimage thither is still obligatory in theory if seldom feasible in practice. Mecca and Medina are still sacred to Moslems and absolutely forbidden to non-Moslems. There were approximately 360 million Moslems in 1950, 1 out of every 7 persons in the world, but, as they are said to have the world's highest birth rate, this proportion may be expected to rise steadily. (See also MOSLEM SECTS.)

Population.—Total population of the Near and Middle East from Greece and Egypt to Afghanistan and western Pakistan may be estimated at 140,000,000, of whom about 124,000,000, or 89 per cent, are Moslems, with perhaps 12,000,000 Christians, a majority of whom are Greek Orthodox resident in Greece, 2,000,000 Hindus, and 1,000,000 Jews. The largest city in the region is Cairo, whose 2,100,000 is more than double that of its nearest rival, Alexandria (925,000). Next come Istanbul (860,000), Teheran (700,000), Lahore (672,000), Athens (487,000), Baghdad (450,000), Karachi (360,000), and Aleppo (320,000). Cities with populations between 200,000 and 300,000 are Ankara, Beirut, Damascus, Isfahan, Izmir (Smyrna), Mecca, Piraeus, Salonika (Thessalonike), and Tabriz.

The total area under consideration is a little less than 3,000,000 square miles, giving an average density of 47 persons per square mile, very unevenly distributed. The most heavily populated area is the Nile delta, while almost vacant areas include all of Egypt outside the Nile and Suez Canal strips, most of interior Arabia and western Iraq, two large deserts in Iran, and parts of Anatolia, Afghanistan, and Baluchistan. Though most of these areas can never support large numbers of people, the fertility of Iran, Iraq, and Anatolia has been greatly diminished by poor agricultural techniques and destruction of irrigation networks. Efforts at diversified, intensive scientific agriculture in Israel may be copied elsewhere if successful.

Inclusion of North Africa from Morocco to Cyrenaica would add about 1,750,000 square miles and nearly 23,000,000 inhabitants, of whom all but 2,000,000 are Moslems. This would bring the total area to 4,700,000 square miles; total population to 163,000,000, with 145,000,000 Moslems and 14,000,000 Christians; and reduce density per square mile to 35. North African cities of over 200,000 are Casablanca (550,000), Tunis (365,000), Algiers (360,000), Oran, Marrakech, and Fez.

Language.—The ethnic stocks are thoroughly mixed throughout the area, and can be approximated only roughly by the more easily analyzed linguistic groupings. Arabic is spoken throughout the Arabian Peninsula and in Iraq, Syria, Lebanon, Jordan, Egypt, and much of North Africa, where Berber and French also are in common use. Hebrew and Yiddish dialects are heard in Palestine, Turkish in Turkey, Greek in Greece and Cyprus, Persian in Iran, Pushtu (Pashto) and Persian in Afghanistan, and Urdu with many rivals in Pakistan. Armenians, who have largely discarded their language except in Soviet Armenia and Iran, but who retain their ancient form of Christianity, are found throughout Anatolia; Greece and Turkey forcibly exchanged respective minorities in the 1920's. Turbulent Kurdish tribes occupy the highlands north of Mosul, and their periodic revolts alternately threaten Turkey, Syria, Iraq, and Iran as they resist cultural subjugation. Half of the estimated 3,000,000 Kurds live in Turkey, 700,000 in Iran, 500,000 in Iraq, and 200,000 in Syria.

Environment.—Physically the Near and Middle East is less diverse than in its human geography. It is dry and hot in summer, dry and mild in winter except around the Mediterranean and Black seas, where wet mild weather prevails. Both ends are high: the Atlas Mountains in Morocco, the Pamirs and Hindu Kush in eastern Afghanistan, spurs of the Himalayas in northern Pakistan. Highlands cover eastern Anatolia and western Iran, rising to 18,600 feet at Demavend and 16,873 at Ararat. The whole region is seriously subject to earthquakes, though the only active volcano is located in the Cyclades. Vegetation is notably sparse, but animal raising—sheep, goats, camels—is general. The occurrence of oil and the absence of land transportation are discussed in the separate section on economic survey.

Education.—The cultural centers are Cairo, Beirut, Athens, Istanbul, Baghdad, Teheran, and Lahore. American colleges and universities at Athens, Beirut, Istanbul, and Cairo have joined European and Near Eastern institutions in educating the most promising young people, but gen-

eral literacy remains low, though dependable statistics are rare. Lebanon, with nearly three fourths of its children of elementary school age attending educational institutions, is far in advance of its Moslem neighbors, among whom Egypt and Jordan with less than 50 per cent at school still are the leaders. Turkey's literacy has risen sharply since the introduction of the Latin alphabet in 1928, but the difficult Arab script delays universal literacy among speakers of Arabic, Persian, and Urdu. The British in India and Egypt and the French in North Africa, and to some extent in Syria and Lebanon during their mandate, tried to spread educational opportunities, with only moderate success. Greece, Lebanon, and Israel rank high among their neighbors in such other cultural activities as journalism, book publishing, and archaeological research.

Summary.—These statistics convey a definite impression that the Near and Middle East, with North Africa, is an underdeveloped area which has not yet been sufficiently integrated into the political and economic structure of the modern world. Although it contains one twelfth of the world's land area, and only one fifteenth of its population, the uselessness of much of that land for cultivation has hampered economic progress. Restoration of fertility to the arable land, irrigation, reforestation, and final defeat of this region's perennial enemies—drought, famine, and pestilence—must be considered goals as important and as urgent as military support and educational advancement.

HARRY W. HAZARD,
Research Associate, Department of Oriental Languages and Literatures, Princeton University.

3. GEOSTRATEGIC UNIQUENESS.

In all the varieties and changes of the fates of empires, states, and peoples of the Middle East, for its whole as well as for its parts, there has been one unchanging and unvarying factor—that determining force which Napoleon in his twofold capacity as statesman and strategist called "the mother of politics"—geography. In fact, he himself was defeated in his reach for world domination by the geography of the Middle East.

History is also geography in motion. The geographical factor in Middle Eastern history has great significance, since no other region is so strategically located as the middle land, where three continents meet and merge, along the middle sea, the Mediterranean, which connects or separates three oceans.

The geographical and geostrategic heritage of the Middle East has been shared by every nation of that area, from the early epoch when the Trojan War was fought for control of the Dardanelles and the first "Suez Canal" was built by the pharaohs, down to our century. Irrespective of whether the governing power was united in a single imperium, as under the Ottoman Turks and earlier empires, or divided among many sovereignties, this heritage of the whole middle land and middle sea complex has been jealously guarded by the Middle East people against attacks from the East and the West. Now a new front for the United States of America has been created along the northern frontier of the middle land on three continents, and the sea between the three oceans has become a lifeline for America as well as for Great Britain.

This three-continental and three-oceanic status

epitomizes the geostrategic uniqueness of the rectangle between the Adriatic Sea and the Indus River, and between the Black Sea and the Indian Ocean. The three coastlines include three peninsulas (Greco-Balkan, Turkish, and Arabian) involving three straits which connect three adjacent seas—the Adriatic, the Black, and the Red—with the Mediterranean Sea and also open or lock the exit to three oceans. In addition, there is the important factor of the strategic islands at the approaches to the straits as well as all over the Mediterranean. On the three continents are the three rivers which have fomented interneighborly and international issues—the Danube, the Nile, and the Mesopotamian Tigris-Euphrates—flowing into the Black Sea, the Mediterranean, and the Persian Gulf.

These geographical facts, as old as recorded history, have created all the geostrategic issues connected with interregional, intercontinental, and interoceanic communications, and with the control of isles and ports, straits and bases, whether by military, naval, or air power.

Two would-be world conquerors expressed the same geostrategic concept of the Middle East in identical terms, Peter the Great and Napoleon, when they proclaimed that whoever controls Constantinople (the Middle East) can rule the world. Hitler's failure in World War II to achieve control in the Mediterranean has not discouraged the Kremlin's 200-year-old Russian ambition for a similar penetration via Istanbul into the middle sea.

To such expanding geostrategy, Gen. Dwight D. Eisenhower in 1947 gave the American viewpoint that if the Mediterranean should be closed to the United States, the latter would be closer to war. Some seven years before this statement was made, the United States government had indicated that the independence of the Middle East nations was necessary to American security. The world has so shrunk that what was once the center of the Old World, by 1940 had become in Franklin D. Roosevelt's words, "the New World center of gravity"; for the Mediterranean, as a link between the Atlantic and the Pacific, had become for the United States almost as indispensable as the Panama Canal and Caribbean Sea. To quote Gen. Eisenhower in 1951, "there is no more strategically important area in the world than the Middle East."

The same geostrategic question through all history (in ancient times, from east to west and vice versa; in modern times, from north to south) has been: Will the Middle East be used as a steppingstone by an aggressive power seeking world domination, or as bulwark against threatening aggression? The British geostrategist, Sir Halford Mackinder, who termed the Middle East "the heart land of the Eur-Asian-African world island," summarizes the importance of this bridge or barrier as follows: "If the World-Island be inevitably the principal seat of humanity on this Globe, and if Arabia, as the passage-land from Europe to the Indies and from the Northern to the Southern Heartland, be central in the World-Island, then the hill citadel of Jerusalem has a strategical position with reference to world-realities not differing essentially from its ideal position in the perspective of the Middle Ages, or its strategical position between ancient Babylon and Egypt."*

* Mackinder, Sir Halford, *Democratic Ideals and Reality*, p. 89 (Holt Company, New York, 1942).

On the hill in Ankara the stones tell the geostrategic story of the Middle East from the era of the ancient Hittites (c. 1550 B.C.), to the *Monumentum Ancyranum*, the famous record left by Emperor Augustus to his Roman subjects around Ankara in 14 A.D. The account is there—of Egypt, Assyria, Babylon, Persia, Rome, and those more recent empires, Byzantium and the Ottoman Empire.

In the narrow gorge amid the snow-covered Taurus Mountains, Greek stele and Roman milestone stand side by side. These too tell of conquest and of empire. Xenophon and Alexander the Great, the general and the geostrategist, traversed the pass. Mark Antony, Caesar's friend, and Julian the Apostate, Roman emperor, later led their legions through it. Frederick Barbarossa, the crusading Hohenstaufen emperor, crossed mountains at this spot close to the treacherous Calycadnus River wherein he was destined to drown.

Farther to the south, in Lebanon, one sees side by side the monuments of the great strategists of their times, erected by themselves—an Egyptian pharaoh, an Assyrian king, a Roman emperor, and the French Napoleon.

Consider the two principal geostrategic lines of the Middle East: the Dardanelles and the Suez Canal. During the Gallipoli campaign (1915) the writer, at the time on a German mission to Turkey, standing with Mustafa Kemal (later Kemal Atatürk) on the site of Homeric Troy, from Achilles' grave and Agamemnon's battlefield observed the enemy British battleship *Agamemnon* and the gallant Anzacs, who had been dispatched in accordance with Winston Churchill's brilliantly conceived but badly executed geostrategic plan. The thoughts expressed by Kemal on that occasion concerning the vital importance of the Dardanelles had nothing of novelty in them. Conceivably, like thoughts had passed through the minds of Agamemnon and Achilles. Such has been the significance of this narrow strait from the prehistoric times of Troy to the Dardanelles Conference at Montreux in 1936, and to the Soviet demands of 1950.

Franco-British-Russian rivalry in the Middle East over a period of two centuries saw the emergence of French and British policies favoring Turkish protection of this international seaway under international agreements and guarantees. Since 1945 American policy has conformed with this western European policy. Turkey has defended her control of this waterway ever since 1356. She had to fight no less than 10 wars in a single century. She fought two wars against land armies marching from Egypt in the south—those of Napoleon in 1799, and Mehemet Ali in 1833, who drew as close to the Dardanelles as Brusa. Five wars against Russia were fought in 1806, 1828, 1853, 1877, and 1914. Russia pressed down from the north into the Balkans and once succeeded in reaching San Stefano (1878), just as her protégés, the Balkan states, would reach the Chatalja line of Constantinople in 1912. Turkey fought two wars against seapowers driving in from the Mediterranean: Italy in 1911 and the British-French Navy in World War I. Four times Turkey was allied with and protected by Britain and France against the menace of land attack from the Balkans; twice she was allied with Russia against a land attack from Egypt. Whenever a third party appeared, such as imperial Germany or Hitlerite Germany, Britain,

France and Russia took joint action regarding the Dardanelles, just as in the late 1940's the United States and Britain assisted Turkey diplomatically and economically against Soviet Russia.

The other international waterway of the Middle East, the modern Suez Canal completed in 1869, has a history of 4,000 years. To accommodate the waterborne traffic between the Mediterranean and the Red Sea the pharaohs dug a canal between the Nile and the Suez Gulf. This "Canal of the Pharaohs" in later ages was renamed the "Canal of Darius" (Darius' stele is still there), then the "River of Trajan," and later, "Canal of the Prince of the Faithful" in honor of Mohammed. When the Middle East land and sea routes were blocked by the three-continental Ottoman Empire, the Portuguese and Spanish geostrategists searched for an independent sea route to the Far East; in so doing they discovered America.

At first the fight over the Middle East was concentrated on the control of the waterways. Later it shifted to competition for overland routes and railways, since great rivers and great highways are always bad neighbors. The Constantinople-Baghdad Railway was needed to link distant parts of the Ottoman Empire to the capital for administrative as well as strategic reasons. But since it could not be planned as a domestic investment, it grew into an international issue of first magnitude because of the immediate strategic interest of rival imperialist powers. For a railway represents not merely a land route or a financial and economic activity, such as the irrigation of land or the cultivation of wheat or cotton, but a line of political influence, an indicated direction of political expansion, a possible road of invasion to colonies and to strategic positions. On the chart of Ottoman Turkey's railways can be read the temperature of Europe's power struggle and diplomatic rivalry. Some of the lines invaded Ottoman Turkey's distant provinces from the periphery of the Mediterranean and tended to weaken the bonds of those provinces with Constantinople. Others, starting from Constantinople, strengthened the Ottoman government with economic and strategic outposts. But one line served to bring into head-on collision two great imperialist powers with interests on opposite sides. This was the Constantinople-Baghdad Railway, misnamed the Berlin-Baghdad Railway. That very misnomer indicates its strategic significance in the opinion of one of the two empires concerned.

The Baghdad Railway (q.v.) is an interesting case in point. It had been a project of the Deutsche Bank as early as 1888, when the concession for the Anatolian Railroad, Constantinople-Konya, was obtained from the Ottoman government. This Anatolian Railroad reached Ankara in 1892 and Konya in 1896. But its continuation to Baghdad, although agreed upon in 1899, had only reached Ereğli by 1908. Then it was conceived alternately as a German or a European (German-French-British) plan to develop the Near East. This economic project increasingly became a bone of political contention between the European powers regarding Near Eastern geostrategic potentialities. The Russians fought it because it served to strengthen the Turks, their "hereditary enemy." England alternately fought for and against it. France's attitude also varied with the Triple Entente's policy. The international character of this economic undertaking,

actually a sort of international highway, can be attested by (1) the German-French financial treaty concerning the Baghdad Railway in 1899; (2) the British government's agreement in 1902 to participate financially in the project; (3) Bernhard von Bülow's belief in 1899 that Russia had dropped her previous opposition to construction of the Baghdad Railway, as at long last Britain did in 1913-1914, a quarter century after its start.

In all epochs of history, when landpowers have disputed with seapowers the possession of territories, chief access to which was by water, the nations gaining command of the strategic sea routes have prevailed over powers holding only strategic land routes. Those nations able to transport overseas at will to the theater of operations the requisite personnel and matériel have invariably triumphed. As examples of this general rule one may cite the victory of the seaborne Greeks at Troy, the defeat of Persia by Greece in the naval battle of Salamis, Rome's victory over Carthage, and that of England and her continental allies over Napoleonic France, mainly achieved through Britain's command of sea routes. In our own day the general rule has continued valid. Examples include: the maintenance by the Allies of the sea routes to Salonika and Alexandria in both world wars; during World War II, the victory in the North African campaign, assured by Allied seapower; also the effect on the war of the ability of the United States, through Allied possession of the sea routes, to ship American war matériel across the Indian Ocean and the Middle East "Bridge of Victory" through Iran to Stalingrad.

The fact that William II and Francis Joseph in World War I, and Hitler and Mussolini in World War II, were deprived of the use of the great world sea routes at the outset of those conflicts, that they were landlocked on the European continent, ensured their ultimate downfall. Seapower again proved the decisive factor, as had happened in the case of those other conquerors—Xerxes, Hannibal, and Napoleon—who made vast conquests of Mediterranean peninsulas only to suffer final defeat by enemies who attained naval supremacy in the Mediterranean Sea.

From ancient times the pattern of seapower versus landpower has repeated itself countless times through history in the Middle East. Just as the Greeks and the Persians had fought the issue, so later Spaniards, Portuguese, Genoans, and Venetians contested it with the Ottomans. England, France, and Russia followed the same pattern in their diplomatic and warlike dealings in the 19th century.

The oil age has turned the Middle East into that intercontinental and interoceanic center of air communications without which no round-the-world and all-weather air route is possible. Thus the recent addition of airpower to the old issue of land and sea communications has only heightened the geostrategic uniqueness of the Middle East as a new center now studded with airbases, American and British, around the Mediterranean from the Atlantic to the Indian Ocean. From these bases it is possible to fly over most of the three-continental expansion—a position which has the particular aspect of immediate closeness to the Russian neighbor and his oil potentials.

"Whoever controls the still untapped oilfields of the Middle East will have power to make peace or war." Thus spoke King Ibn Saud to Presi-

dent Franklin D. Roosevelt, when they met in 1945 during World War II on an American warship in the Suez Canal less than two months before the president's death. American oil geologists have characterized the Middle East as the "center and the heart of the international oil production"; "the world's greatest reserves of oil, vast beyond imagination, with unparalleled abundance"; the "potential biggest development of natural resources ever undertaken by American investments" including the vast network of pipelines from Arab lands to the Mediterranean. Ibn Saud's statement to Roosevelt is but a restatement of Clemenceau's characterization of oil as "the powerful last word in matters of peace and war."

In 1951 the United States had an oil monopoly in Saudi Arabia, as had Britain in Iran (a monopoly attenuated by the Iranian government's expropriation of the Anglo-Iranian Oil Company's holdings in March-April 1951), while in other parts of the Middle East, particularly Iraq, the United States and Britain owned common shares with French and Dutch investments. According to official joint statements of the strategic, political, and economic authorities of the United States government, Middle Eastern oil is indispensable for the United States Navy in the Mediterranean Sea and the Indian and Pacific oceans, as well as for European recovery under the Marshall plan. Oil is still the most strategic raw material on which alone navies, armies, and air forces can move, even in the atomic age. The atom bomb has not reduced the requirement of liquid fuel; it only has placed a higher premium on airborne transport as against ships. Since the bomb cannot fly, it must be taken to its objective by plane or by missile needing oil.

Thus the geostrategic uniqueness of the Middle East is based on the twin pillars, one of which represents the old center of world communications, and the other, the newly developed natural power—oil, vital for peace or war.

4. CENTER OF CREATION, RADIATION, AND MEDIATION. The Middle East forms that part of the world where the most dramatic and decisive episodes in the history of mankind were enacted. There, in prehistoric times, took place the discovery and working of metals, presumably in the Transcaucasian Mountains or on the southern shores of the Black Sea; in Afghanistan and adjacent countries, the cultivation of plants, along with the domestication of animals; and it would seem that from the disks of the sun and moon, the

wheel descended to earth in the forms of the potter's wheel, the cartwheel, and the cylinder. The way having been paved by such achievements, there arose on the soil of the Middle East that almost inextricable mass of states and civilizations among which murderous rivalries seem to have stimulated, rather than impaired, the creation of great cultural values. There is in our Western civilization much which stems directly from the Middle East, and hardly anything which cannot be traced ultimately to the Middle East.

Nowhere have heaven, earth, and the nether world been so well balanced, so neatly separated, yet so intimately connected as in the magic-based civilizations of ancient Egypt and those of Mesopotamia, particularly Babylon. All civilizations of the Middle East seem to have been created by down-to-earth people to whom life meant everything, the life of the nation no less than that of the individual. In defiance of transiency, they erected monumental buildings (pyramids, temple towers, palaces) and used their art, sculpture, relief, and painting for the main purpose of transmitting to posterity portrayed personalities and scenes of their life in war and peace. From the same powerful motive came the invention of the script, which may have occurred in more than one place, perhaps in Sumer and in Egypt. Starting with the pictographic, it developed into syllabic script and—only in the Middle East—reached its climax in the invention of the alphabetic script which, by its convenience and adaptability, foreshadowed the intellectual achievements of Western civilization. (See also ALPHABET.) The art of writing spread not only to the West; India also received it from the Middle East, one form deriving from the Phoenician, the other from the Aramaic script.

Nowhere else, on the other hand, did the deep anxiety ingrained in life, the fear of the ephemeral, the horror of death and destruction, become so predominantly elements of life itself. Mythomagic journeys to the nether world and heaven in quest of immortality and resurrection were pictured in grandiose epics (such as those of Gilgamesh, q.v., and Etana), preparing the way for the savior-religions. Nowhere else was the world of heavenly powers and gods so concretely visible, without, however, suffering the anthropomorphism of the Greeks; nowhere were designs and influences traced and controlled with so keen an awareness as in the astral religions of the Middle East. Identification of the deities with sidereal bodies not only carries an immediate certainty of their existence, but also awakens a passionate interest in the stars. Hence, scientific astronomical observation and calculation became connected with astrological interpretation. The Mesopotamian duodecimal system lives on within our own decimal system, in the division of the zodiac, in the reckoning of the year and the hour. The dependence of terrestrial events on sidereal constellations (the "influences" flowing from the stars to earth) is not only the most impressive of the magic links binding the three worlds together, but also testifies to a sense of order and harmony, an idea of law and its formulation.

This world conception was overcome by the one God of the Hebrews when, in the times of the prophets, the idea of God was freed from the limited view of a tribal and national god and from the mythomagic elements inherent in it. With Christianity and Islam deriving from Juda-

ism, the Middle East monopolized monotheistic religion, whereas Europe proved unproductive in the realm of higher religion. This is evident from the secular character of Greek culture and of Western civilization as a whole. Thus with the triumph of monotheism on the one hand and the rise of a secular culture on the other, an epoch ended.

Greece rests upon the civilizations of Egypt and Asia, including the intermediary but highly independent civilization of the Aegean Islands with Crete as its center. Early Greek art bears the mark of its Aegean paragon, and before adopting their alphabetic script from the Phoenicians, the Greeks seem to have used script of Cretan origin. However, there never was a more creative assimilation and transformation of foreign influence, or a more momentous creation than the culture that rose on the Greek peninsula. The forms of our Western thought and the means of philosophic and scientific expression stem from Greece, as do the spheres of our cultural life and the objects of our interest. If Christianity constitutes the only significant exception, still the dogma and the theology of the church are the work of Greek thought. As to the modern period, the formation of the mind and the orientation of our interest are obviously more deeply determined by Greece than by Christianity. Greece assigned to philosophy the place hitherto occupied by religion, and Greek philosophy from its beginning was closely connected with the quest for scientific knowledge. From this relationship, the scientific effort of the West—though its roots were in Egypt and Mesopotamia—derived its nature, becoming a dispassionate and disinterested movement of the mind inspired and guided only by the desire for knowledge constituting an aim in itself. The same spirit prevailed in Greek historiography. True, the pertinent parts of the Old Testament are remarkable pieces of historiography, reliable and colorful, but they are sacred history and confined to the story of the chosen people. Herodotus, on the other hand, transcended the national limits and, embracing the peoples of the then known world, wrote about their history and cultural conditions, intent on a critical evaluation of his sources.

The variety of forms of government in Greece had a significant forerunner, distributed however among different peoples. The close connection between rulership on earth and the divine powers was apparent in the priest-kings of old and the kings who claimed to be the sons or representatives of the god; but the few examples of divine kingship, where the king claimed a divine nature and required worship, came into being in all probability with the successors of Alexander and belonged to the Roman emperor cult. The true theocracy of the Jews was of a different character. Were they judges, prophets, or kings at the head of the political community, it was God Himself who ruled through the laws He had given, the revelation of His will being announced by the high priest and involving His constant concern with the fate of the nation. A secular form of republican government was represented by the Phoenician city-states such as Sidon and Tyrus (Tyre) where, as in the Republic of Venice, the highest officials were selected by and from a commercial oligarchy. So far as autocratic rule in the Middle East is concerned, it must be emphasized that in Sumer and Babylon—

in sharp contradistinction to Egypt—the kings in early times limited their arbitrary power by the establishment of a body of laws which was more than simply the codification of traditional customs, the best known being that of Hammurabi. (In past years many scholars placed the time of Hammurabi before 2000 B.C. Now, according to the "low" chronology, some authorities place the time between 1728 and 1686 B.C.) It was this idea of a statutory law, together with the political form of the city-state, which constituted the parallel of, and bridge to, Greece—with this distinction however: that unlike their predecessors, the Greeks considered laws not as commandments of their god, but as inherent in nature or as the free invention of man. The instability of their forms of government, particularly in Athens, anticipating almost everything that emerged in Western political history, and their incapacity to overcome particularism undoubtedly fostered their exemplary investigation into political theory and philosophy. The result of all this was the *polis*, the city-state, where free citizens deliberated their own affairs, a unique creation bearing inestimable consequences. On the other hand, the formation of empires fell to others. The Babylonians, Assyrians, and Egyptians extended their realm far beyond their national territories and amalgamated major parts of the Middle East. But only in a loose and inaccurate sense can these large dominions be called empires. No constructive idea, no organization held them together; they were founded on the power relation of the conqueror and the conquered people—people always at the victor's mercy. The Persians were the first to create a world empire worthy of that name. Unlike their predecessors, the Achaemenian kings imposed on the conquered neither their religion nor their language; they did not interfere with any expression of the cultural life of the nations. Although strict centralization was the underlying idea of their administration, the Greek subject cities of Asia Minor were permitted to preserve their local autonomy and, as a general rule, the sovereign's authority was limited to taxation and levy. Thus, while it is true that the idea of the autonomous individual personality, its freedom and rights, originated in Greece, the recognition of the national personality as a cultural entity must be credited to the Persians. The religious background gives this empire conception its full meaning and importance. The Achaemenian king of kings carries out the mission entrusted him by the great god Ahura Mazda (Ormazd), namely, to rally all men under his command to fight the powers of evil and make the earth a good place in which to live.

Alexander's world empire was the only one to contain, during its short life span, all the lands of the Middle East. What the concrete shape of his dream of coalescing West and East into one body would have been, is not known. His premature death, his world-shaking exploits condensed into so brief a period, his comet-like rise and disappearance, the worship paid him as to a god-like being, made him, more than any hero in history, a figure in whom the borderline between reality and imagination was effaced, and whose memory was glorified by legends and epics in the countries of the West and Middle East. What Alexander has meant as an inspiration and paragon to conquerors and world builders, can hardly be estimated.

The interpenetration of Greece and the eastern countries of the Middle East following Alexander's conquest is the only example of the meeting of Western and Eastern civilization on equal terms. Had the Persians conquered Greece, their indifference to foreign cultures would have rendered creative contact more difficult. The aggressive curiosity of the Greeks, on the other hand, and their ready appreciation of Persia made Hellenism a unique phenomenon, almost immeasurable in its effect on East and West. Greek philosophy with Neo-Platonism as the leading force, the religious philosophy of Judaism, the mystery cults of Greece—all competed in the successor states of Alexander and in the Roman Empire with those of Egypt and Asia, until final victory fell to Christianity—itsself a religion sharing with the mystery religions the belief in the initiate's spiritual participation through mystic rites in the death of the god and his resurrection. In Gnosticism (q.v.), less a system and doctrine than a great spiritual movement, the old Zoroastrian dualism of Good and Evil revived and inundated the world, increasing in strength when the Persian sage Mani (Manes or Manichaeus, 216?–276 A.D.) fused elements of practically all the forms of faith and religious philosophy into a mythology and metaphysics of salvation—a process ending in the immediate knowledge (gnosis) of God. Several and not the least important of the heretical sects, usually known by the common name Cathari, which during the 11th, 12th, and 13th centuries spread to northern Italy and southern France, betray their Manichaean origin. On the other hand, Gnosticism penetrated deep into central Asia, where, as in India, the influence of Hellenistic art was considerable, though not always beneficial. (See section *Oriental Christianity*.)

Such an expansion and interpenetration of ideas and creeds would have been impossible, had outer conditions not been favorable. There existed, particularly between the successor states of Alexander, facilities of communication and exchange which continued into the Roman Empire, with the exclusion of Persia which had regained her independence under a native dynasty. A standard Greek dialect (*koine*), commonly understood, made trade relations easier, comparable to, but more widely spread than the *lingua franca* of later times. To the old sea routes frequented by Egyptians, Cretans, and Phoenicians was added a new one from the Red Sea to China. The land routes through Persia to India and the silk route from the Phoenician seaports through central Asia to China gained in importance. Thoroughly planned cities constructed after the Greek model sprang up on Asiatic soil with municipal autonomy; with their market places, theaters, and gymnasiums they became centers of international life. The administrative system in the successor states, drawing on the powerful centralism of the Sassanian Empire, as well as on the liberal and democratic ideas of the Greek city-states, was elastic and efficient enough to serve as a model to the Byzantine and Arab empires, and to extend some of its influence to the Western World. Government thus assumed the function of fostering scientific research, and centers for the study of science and the liberal arts arose around such places as the famous library and the museum of Alexandria. The names of Hero (Heron), excelling in mathematics and mechanics and in the invention of automata; of Hipparchus, the

founder of mathematical astronomy; of Archimedes, Euclid, and many others, are well known. Medical research and sanitation became the preoccupation of government; in the Egypt of the Ptolemies, medical assistance was a public service. Nor was activity in the field of arts less prolific and influential than in the scientific, though it was less creative. Several new forms of literature, particularly the novel, must be credited to that era.

Whatever the date considered to mark the crisis or end of the Hellenistic period—the Roman or the Arab conquest—the period had from 600 to 900 years of vigorous, tenacious, and creative life. Hellenism represents the greatest syncretistic civilization the world has seen, ebullient with potentialities due to the variety of its components and the possibilities of their entering into multifarious combinations. However, it was inherent in its very nature that, just as it originated from disparate civilizations, so it had to engender or, at least, lead up to new civilizations. Indeed, Hellenism became the soil from which Byzantine and Islamic civilizations sprang. The originality of the Byzantine Empire—immediate heir of Hellenism and its faithful treasurer—lay in the fact that state and culture were impregnated with Eastern Christianity. This fact gave Byzantium the atmosphere of a theocratic state. Its almighty bureaucracy regulated prices, organized public works for the unemployed, watched over public hygiene, and established orphan asylums. Contrary to the contemporaneous West where education was practically limited to the clerical class, Byzantium had institutions of higher learning from which women were not excluded. While the pursuit of science was never its foremost concern, the ideal of universal education, later proclaimed by the Renaissance, was recognized in Byzantium, and personified in the great figure of Michael Constantine Psellus (1018–1078), statesman, jurist, philosopher, historian, and poet. In art the highest achievement was expressed in the churches with circular domes over rectangular naves, churches which, with their luminous mosaics, gave the pattern to church construction in Italy, from Venice to Sicily. The Byzantines alone created a real military science, and the Arabs learned from them how to improve their armaments.

The connection between Hellenism and Byzantium appears as a natural relation between cognates. On the other hand, the part Hellenism played in Islamic civilization proves once again its universality and resilience. The impetus toward the formation of a new civilization came from the Arabs who, as they so often had done before, broke from their peninsula in the 7th century, their energy this time increased by the conviction of being the protagonists of the true faith. Islamic religion submitted less to Greek and Hellenistic thinking than did Christianity, but just as Christianity conferred its character on medieval civilization, so Islam created the atmosphere in which the Islamic civilization originated and continued to live. Islamic civilization is the result of the combined effort of Arabs, Persians, Byzantine Christians, Jews, Egyptians, and Berbers—all of whom adopted Arabic, if only as their second language, while the creed of Mohammed spread among them. If the rapidity of the Arab conquest is due to Arab vigor and fanaticism, the triumphant expansion of Islamic civilization must be explained to a

large extent by the fact that almost everywhere its way was prepared by the common Hellenistic ground. While Islamic civilization cannot compete in originality with the Egyptian and Babylonian civilizations, and still less with the Greek, it realized the highest achievements in almost every sphere over a period of about 900 years—taking the 8th century as its beginning and the Safawid (Safavid) period in Persia and the almost contemporaneous efflorescence of the Ottoman Empire, particularly under Suleiman the Magnificent (1520–1566), as its last great manifestations. Its cultural radiation can hardly be overestimated. Islamic religion, political domination, and civilization, extending beyond its Middle Eastern homelands, embraced at times southern Europe and the Balkan Peninsula, North Africa and wide regions south of the Sahara, central Asia and the India of the Mogul emperors, made important ramifications in China and Indonesia, and testified during the periods of its efflorescence to a universality, dignity, and abundance of values which make it the equal of any other civilization. There was, for example, a refined material and cultural life in the 10th century at the courts and in the cities of Baghdad, Cairo, Palermo, and Córdoba, at a time when the bulk of Europe was still a backward and in many ways a barbarian continent. It needed a man of the stature of Frederick II (1194–1250), who entertained at his court Italian, Greek, Mohammedan, and Jewish scholars, to overcome the prevailing prejudices and limitations.

With few exceptions, Moslem (Muslim) rulers and people practiced religious tolerance—and this not only in the first centuries of Islam—whereas in Europe a blind and cruel intolerance determined the attitude toward people of other faiths. Crusaders, having been fed with fantastic stories about the situation of the Christians under Moslem rule, could not conceal their boundless amazement when they saw Moslems, Christians, and Jews living together harmoniously in prosperous communities. As late as the time of the Crusades, Christians were named to high state offices. This general line of policy and attitude continued under the Ottoman Empire. It was only in Spain that the immediate contact of Christian and Mohammedan kingdoms produced on the part of the Christians a true appreciation of Islamic civilization. There, on Spanish soil, a happy and fruitful interpenetration of Islamic and Christian cultures took place for centuries. Hispano-Moorish architecture and crafts resulted from this cooperation, and the products of Andalusia—jewelry, arms, enameled glassware, tapestries, paper, and other things—were well known in all Mediterranean countries. As to the creations of the mind, the work of ibn-Arabi (1165–1240) influenced Dante's composition of the *Divina Commedia*. The origin of the troubadours can be traced to Moslem Spain, and it is not unlikely that the system of European chivalry goes back to Arab models. The Arabs everywhere translated Greek works in close collaboration with Arabized Persians, Christians, and Jews, both Christians and Jews being steeped in Arab civilization and writing in the Arabic language. Thus Moslem philosophers, mathematicians, physicists, astronomers, physicians, and others translated pertinent Greek books and based their own works on them. Many Greek texts, the originals of which are lost, exist only in the

Arabic translations, and their retranslation into European languages (like that of the original Arabic works, for example, on astronomy and alchemy) contributed considerably to that stream of thought which converged with the Renaissance movement. Whereas the Arabs were content with cultivating and continuing the Greek tradition, the Europeans recreated and assimilated in an original way the classic heritage, thereby establishing the Humanism of the Renaissance and the foundations of modern science. Yet our debt to the Arabs remains. This is particularly true with regard to their autonomous creations such as the work of ibn-Khaldoun (1332-1406), a Berber and native of Tunis, the first to conceive a philosophy of history. The name of al-Biruni (973-1048), astronomer, and author of a book on India based on a thorough knowledge of Indian religion, literature, and customs, also that of ibn-Batuta (1304-1378), likewise of Berber origin, one of the greatest travelers of all times, who left such fascinating reports on his travels—both stand for that spirit of adventure and curiosity, so admirably presented in *The Arabian Nights*, which made the Moslem merchant, traveler, and explorer, scientist and geographer pillars of world civilization.

As to material culture, Islamic countries, when they did not invent and create, became mediators between India and the Far East on the one hand, and Europe on the other. Just as the Arabs passed the "Arabic" numerals they had received from India to Europe, so they gave paper and its fabrication to the Christian West where the first paper mills sprang up in southern France. The compass, as well as paper, a Chinese invention, was known to the Arabs before it came to Europe. Though explosives and guns had been invented and used in the Far East long before, the Turks were the first to use artillery on a large scale during the siege of Constantinople in 1453. As to domestic animals, cultural plants and other products of the soil, styles and articles of dress, the West's indebtedness to the Middle East is too well known to be mentioned herein. See also separate section, *The Arts*.

5. HEBREW CIVILIZATION. When Israel appeared on the historical scene, the Near East had behind it a long and significant record of civilized life. While the prehistory of Israel during the first centuries of the 2d millennium B.C. is shrouded in darkness, it appears that the Biblical narratives connecting the patriarchal age of Abraham, Isaac, and Jacob with both Ur of Chaldea and Egypt reflect some historical events. Within the more or less perpetual migration of ancient peoples speaking Semitic languages, from the Fertile Crescent to the Nile Valley, there also sporadically appeared groups called Habiru (probably identical with Hebrews). These migrants furnished not only the first permanent Hebrew settlers of ancient Palestine but also certain tribes which found their way into Egypt, later to return to the land of Canaan under the leadership of Moses. Israel's sojourn in Egypt partly coincided with the reign of a mixed Asiatic people, the Hyksos; the latter ruled over the Nile Valley for some 160 years (c.1730-1570 B.C.). The presence of a Semitic group in

the northwestern district of Goshen, in and around the city of Tanis (Avaris or Zoan), has been confirmed by numerous excavations. Even Hebrew names of localities have been identified in that district. The date of the Exodus, which was so momentous to Israel, but of minor significance to Egypt, is still controversial. While some scholars date it, more in accordance with tradition, in the mid-15th century B.C., the majority still favor 1290 B.C. (Albright) or 1220 B.C. as the most likely date.

These beginnings, in many ways peculiar to the Hebrew people, affected all their subsequent destinies. Already at this point we notice the Hebrews' absorption of a variety of cultures. The Jewish people never forgot that they had originated in Mesopotamia, had spent many generations in an Egyptian ghetto, had lived for "forty" years as a migratory tribe among Bedouins in the desert, and finally had settled within the mature civilization of Canaan which in the days of Moses and Joshua already had behind it more than a millennium of civilized life. Confronted by such a rapidly changing situation and quickly integrating the lessons of all these civilizations, Moses and his successors had to transcend in their legislation and general outlook on life the exigencies of the moment, or the boundaries of any particular region, and to think in more permanent and worldwide terms. Therefore it is not surprising that, responding to such a challenge, these early Israelites groped for the new religious formula of monotheism, a faith which would correspond to their own experiences and needs and encompass the entire civilized world known to them.

Another remarkable development permanently affecting Hebrew thinking was the people's undying remembrance of its foreign origins. Much more strongly than even the Greeks after them, the Jews always referred to the great events which had taken place beyond the confines of their own country. Forever after, they considered their Exodus from Egypt and the revelation on Sinai, both located outside their national territory, as the most significant events in their own history, indeed in the history of the universe. Prophets and lawgivers never allowed them to forget that it was a Diaspora which had created their state because of grace divine and that, hence, they might lose that state if they departed from the ways of the Lord. Curiously, the same extraordinary phenomenon of a Diaspora creating a nation, in contrast to mother countries colonizing new areas, repeated itself twice in Jewish history: namely, the return in 538 B.C. after the Babylonian Exile, and again in 1948 A.D.

Connected with this evolution was also the rise of a new type of polity unparalleled in the ancient world. Beginning with a loose confederation of independent tribes, some ruled by judges during emergency periods, the people long preserved its unity only through common allegiance to its Mosaic faith and its amphictyonic sanctuary at Shiloh. Even when, under foreign pressure, several tribes united for purposes of defense under such a commander as Gideon and later all northern tribes jointly elected their first king, Saul (c.1020-1004 B.C.), their cooperation with the southern tribes, led by Judah, was based on ethnic and religious, rather than political solidarity. Only during the short span of the reigns of David (c.1004-965 B.C.) and Solomon (c.965-926 B.C.) did ancient Israel possess a united

monarchy. It soon broke asunder into Northern Israel which lasted until the fall of its capital Samaria in 721 B.C., and Judah, which endured until the fall of Jerusalem (serving as its capital since King David) in 586 B.C.

It was of greatest importance that, except under Solomon, the Israelitic monarchy never exercised the absolute power, nor was it invested with the divine qualities characteristic of other Oriental kings. Israel's monarchs always remained under the law. The administration of justice was, to a large extent, in the hands of priests and lay judges accepted by the population of the numerous townships independently of the royal will. Time and again the political, economic, and religious disorders in the country brought forth serious censures of kings and their counselors by prophetic spokesmen of the people, who had no other claim to leadership except their call to prophecy. Just as Elijah successfully combated about 855 B.C. the syncretistic Baal worship of King Ahab and his Phoenician wife, Jezebel, so did Amos, the first of the writing prophets, make social justice the keynote of his memorable harangues. After the return from Exile in 538, the Second Commonwealth had no kings at all for nearly four centuries. Even later, the weakness of its governmental structure was so marked that the historian, Flavius Josephus, had to coin a new term for it. By calling it a "theocracy," he meant not so much the rule of priests, scribes, or any other ecclesiastical organs, as the direct sovereignty of God under whom even Israel's kings had been mere mortals. In this way was injected into human history a new approach to political and social relations which has permanently affected all of Western civilization; for it was formulated by a succession of extraordinary prophetic leaders (Hosea, the two Isaiahs, Jeremiah, Ezekiel, and others), psalmists, and teachers of wisdom, and it was invested with deep religious sanctions which ultimately proved victorious through the spread of Judaism, Christianity, and Islam.

Still another result of these extraordinary developments was the rise of a peculiar type of democracy. It was not principally an electoral democracy, although public assemblies on both the local and national levels were often held. When King Josiah wished to introduce his Deuteronomic reformation on the basis of a newly found scroll (621 B.C.), he convoked "all the men of Judah and all the inhabitants of Jerusalem with him, and the priests, and the prophets, and all the people both small and great" (II Kings 23:2-3; cf. Ezra 3:1, etc.). This democracy was based principally upon the recognition of the dignity of man, with every Israelite sharing on an equal basis in the covenant with the Lord. Josiah's contemporary, the prophet Jeremiah, found particularly incisive words to instill in his people the doctrine of individual responsibility and individual worth. At the same time it was a democracy based on communal self-government of the numerous smaller and larger towns throughout the country and the organic cooperation of the citizenry at large with local elders, judges, and priests. The latter retained a great religious and educational function even after the official desecration of the local shrines by the Deuteronomic reformers. Schooled through long centuries of such extensive municipal self-government, the Jewish people continued to live an autonomous communal life even after

the loss of its national sovereignty. Thus arose, through a long process of trial and error, the Jewish Diaspora community, centered about another revolutionary innovation, the egalitarian synagogue without sacrifices or priests, which assumed growing importance in the history of the entire Mediterranean world.

A Jewish dispersion had apparently existed in Palestine and elsewhere even before the fall of Samaria. Just as there were numerous Canaanites in the territories occupied by Israel—the process of amalgamation continued at least to the days of Solomon—so did the latter learn permanently to share their small country with such neighbors as the Philistines, Edomites, Moabites, and Ammonites. In fact, because the Philistines living on the Mediterranean coast first came to the attention of the Greeks, the whole country has ever since been known to the West as Palestine. Geographically placed between such expansive empires as Egypt and Assyria-Babylonia, the country was easily drawn into the vortex of international power politics. Our records become more explicit from the time of King Ahab's participation in an alliance of Syro-Palestinian kings which stopped the first Assyrian expansion at the Battle of Karkar (Qarqar, 853 B.C.). Each invader doubtless carried off many Israelitic prisoners who, for a time, probably continued to profess their ancestral faith during exile. Moreover, if we are to believe stray Egyptian papyri, some Hebrews had remained in the Nile Valley long after the majority's Exodus. There also were Jewish bazaars in Damascus in the days of Ahab. In short, there perhaps never was a time when all Jews lived in Palestine.

After the fall of Samaria, a large portion of the northern Ten Tribes was deported into distant lands. Although the majority of these exiles was sooner or later assimilated by their neighbors (the subsequent legends concerning these Lost Ten Tribes made of them ancestors of many nations from the British and Japanese to the American Indians), a minority doubtless persisted until they were joined by the new deportees from Judea after the fall of Jerusalem. From that time on, it appears, Diaspora Jewry always exceeded in number the Jews of Palestine, with the sole exception perhaps of the brief period of the Maccabean regime (c.140-63 B.C.). The entire history of the Second Commonwealth was, indeed, dominated by this interrelation between the Palestinian center and the ever more far-flung dispersion.

Dispersed Jewry's insistence on the preservation of its ethnic-religious identity amidst various nations was often misunderstood and, because of its extraordinary nature, created much ill-will. Haman's exclamation reported in the Book of Esther (3:8) became a keynote of ancient, as well as medieval and modern, anti-Semitism. "There is a certain people," this Persian courtier is quoted as saying to King Ahasuerus, "scattered abroad and dispersed among the peoples in all the provinces of thy kingdom; and their laws are diverse from those of every people." Less pertinent was Haman's accusation, "Neither keep they the king's laws." On the whole, the Jewish community readily abided by the laws, of the various countries in which it lived. At times, in fact, it became identified with the powers in control and suffered together with the latter from any attack on the established order. The Jewish

soldiers, for example, established by the Persian rulers in a military colony in Elephantine, Upper Egypt, to defend the frontier against raids from Ethiopia, were attacked by their Egyptian neighbors as abettors of the foreign regime of Persia.

These hostile, as well as friendly, Judeo-Gentile relations were intensified after the historic conquest of the Near East by Alexander the Great (4th century B.C.). The first contacts between Judaism and Hellenism were amicable, Aristotle himself reputedly being greatly impressed by the wisdom of a Jewish interlocutor. In time, however, the growth of the Jewish dispersion, the perseverance of Jews in their ethnic-religious separatism, contrasting with the growing uniformity of mores in the rest of the Graeco-Roman world, and the numerous conversions of Gentiles to Judaism resulted in the rise of what is frequently called "classical anti-Semitism." Leading writers like Seneca and Tacitus often spoke of Judaism in terms reminiscent of vulgar Jew baiters. In many cities, particularly Alexandria, Jews were embroiled in centuries-long controversies with their Hellenistic neighbors.

Governments whether Persian, Hellenistic, or Roman as a rule protected the Jewish minority against such local onslaughts. These multinational empires found in dispersed Jewry, at least for a time, a factor cementing the imperial unity against disruptive local forces. From Cyrus and Darius, through Alexander, Ptolemy I, and Antiochus III, to Caesar and Augustus, the imperial rulers extended to Jews a variety of privileges, not only preserving a measure of their economic and civil equality but also giving them considerable autonomy in cultivating the "mores of their forefathers." For example, a remarkable decree, dated 419 B.C., has been found among the Elephantine papyri. Here Darius II enjoined the Jewish soldiers, as he doubtless ordered the other Jewish communities throughout the empire, to observe the Passover in accordance with the Biblical law. Despite frequent Roman misunderstandings of Jewish "idleness" during a weekly day of rest, Augustus allowed Jewish parties and witnesses to refuse to appear at court on the Jewish Sabbath. He also ordered that the Jewish poor in the imperial capital be given on Friday a double measure of grain as well as money in lieu of the oil ritually forbidden them.

At times, however, forces of uniformity tried to break down Jewish separatism. In extreme cases, this led to outbursts of religious intolerance. When Antiochus IV (Antiochus Epiphanes) tried to force Palestinian Jewry to adopt Greek paganism, he provoked thereby an open rebellion led by the priestly family of Maccabees. The Maccabean revolt (165-161 or, more broadly, 175-135 B.C.) has become memorable in human history not only because it re-established for a time a fully sovereign Jewish state, but also because it introduced for the first time the idea of religious martyrdom. The Maccabean martyrs of the Fourth Book of Maccabees, although wholly legendary, became as significant in the destinies of mankind as did the political and military leaders of the successful revolt. The newly developed sectarian movements of Pharisees, Sadducees, Essenes, New Covenanters, and others, superimposed upon the long-simmering Samaritan schism, searched for ever-new solutions to the perplexities of existence, without in any way budging from the principles of historical-ethical monotheism.

Another answer was given by Jewish apologists in the dispersion. Themselves imbued with the ideals of Greek civilization, speaking and thinking in the Greek rather than Hebrew idiom, they nevertheless staunchly adhered to their faith. They had to justify it, however, both before the world at large and before their own coreligionists who had grown away from the naive religion of their forefathers. For example, although the Bible was less anthropomorphic than Homer, enlightened Greek opinion resented its ascribing corporeal qualities to God. The Greek translation of the Bible, therefore, the Septuagint, prepared for use in the Jewish synagogues as well as for purposes of the Jewish religious mission, modified some of these Biblical passages so as to remove human passions from the Deity. A large number of historians, poets, and philosophers (Demetrius, Eupolemus, Artapanus, Philo the Elder, and others) tried to trace the origin of all wisdom to the work of Moses.

Hellenistic Jewish literature, largely centered in Egypt, produced in Philo Judaeus of Alexandria (died before 50 A.D.) a philosopher of considerable distinction. Combining the Platonic style with Jewish tradition, Philo wrote a number of allegorical commentaries on the Bible in which he attempted to synthesize Judaism with Greek culture. This synthesis, and even more, its allegorical method, deeply influenced the subsequent generations of religious thinkers among Neo-Platonists, Jews, Christians, and Moslems. In the historian Flavius Josephus (died c.100 A.D.), the combination of Jewish and Greek historiography produced a monumental record of the historic evolution of the Jewish people as well as of its final tragedy, the war against Rome (66-70 A.D.). This clash between Judaism and the Great Western power, ending in the burning of the Temple in Jerusalem (70 A.D.), was followed by the debacles of Diaspora Jewry's revolt against Trajan (115-117 A.D.), Palestine's Bar Cochba (Kokba) revolt (132-135 A.D.), and the complete political eclipse of the Jewish state. But the ethnic-religious history of the Jewish people continued in both the East and West. In view of its ever-shrinking minority in Palestine, Diaspora Jewry now assumed definite leadership. It perpetuated the Jewish way of life by continuing the work of the Pharisees and creating the monumental literature of the Talmud. See also JEWISH HISTORY AND SOCIETY.

6. INFLUENCE OF HELLENISM ON THE MIDDLE EAST. Hellenism is the term used to denote the civilization of the Greeks. In his book *Alexander the Great*,* Charles A. Robinson writes: "The true legacy of Greece consists not of art and literature, beautiful as they are, but of a mental attitude, the insistence on the primacy of reason. Neither ancient Rome nor the Middle Ages nor Asia (ancient or modern) has made the mind the controlling factor in human affairs, but ancient Greece did, and as the originator of what we call the modern spirit she is part of us."

From their earliest appearance on the Mediterranean scene, the Greeks were distinguished from the races around them by their consciousness of their own intellectual superiority. The Greek language, which was the symbol of the common Hellenism of communities frequently politically hostile to one another, also expressed the common way of life and thought which made them superior to the barbaroi—the non-Hellenes whose utterances sounded to the Hellenes like "bar bar" and whose acceptance of despotism was incomprehensible; for a basic concept of Hellenism was that of *Eleutheria*, loosely translated "freedom" but transcending the modern meaning of the word. Unlike the barbarian who considered slavery as part of the order of nature, the Hellene, whether he lived under a king, an oligarchy, or a democracy, was essentially and irrepressibly *eleutheros*: free in his thought and imagination, free in his will to assert himself, truculently free in his determination to argue, free to legislate the restriction of his freedom and then to revolt against his own legislation.

Modern Fascists have made the grave mistake of pointing to Sparta as the prototype of their police state. Nothing could be further from the truth. Sparta was a Hellenic kingdom all of whose able-bodied citizens were kept in permanent military training. Her exiguous citizen-population and her precarious geographical position made disciplinary leadership and training necessary, and the Spartans made a virtue of necessity. In their case the Hellenic *Eleutheria* manifested itself clearly: first they had *two* kings, lest a single king aspire to absolute rule; second, a board of ephors elected by, and responsible to the citizens, controlled the kings, levied taxes, and exercised the functions of government. Here is no Fascist state or dictatorship; it is Hellenic *Eleutheria* adapting itself with sensible rigor to the exigencies of survival, for above all else the Hellenes were realists.

By the 7th century B.C., the Greeks were firmly established on the mainland of Greece, the Peloponnesus, and the Aegean Islands and were expanding their power by founding cities along the Black Sea and the coast of Asia Minor. The

sea was the principal medium through which the Hellene operated; the Aegean has always been a sea that unites, not one that divides. On either shore were the Hellenic cities which were his maritime and commercial bases—the mother-city in Greece maintaining a close association with her daughter in Asia, who reproduced her civic pattern. The *polis* (city-state) was perhaps the most representative expression of Hellenic civilization in progression. It was based at least as much upon the realism of commerce as on less earthy ideals, so that when Aristotle declares that man is a political animal he does not mean what his mistranslators assume, but simply that man is an animal suited to life in the *polis*. By the end of the 6th century B.C., Hellenic commercial power, by reason of its lusty organic growth and the indispensable services it rendered to the agricultural populations of the Asiatic hinterland, had asserted itself in Thrace, on the Black Sea, in Ionia, and down the coast of Asia Minor to Naucratis on the Nile delta, the earliest Greek maritime settlement in Egypt. Greek influence penetrated into the courts and councils of Asiatic potentates who frequently employed cultured Greeks as administrators. The highly individualistic nature of the Greeks, and the incessant disputes both internal and external among the Hellenic cities in Greece and in Asia Minor, lulled the great Oriental despots of the interior into a false sense of security to which the formidable military power of Persia lent credibility. But Hellenic civilization on the upsurge had a dynamic vitality; only political disunion kept it from expanding more rapidly than it did. When, at the end of the 6th century B.C., Athens emerged as a full democratic state in which all citizens had equal rights in government, she automatically took the imperial lead. Herodotus writes: "It is proved by many instances that equality is a good thing. While the Athenians were under undemocratic rulers they were no better in war than any of their neighbors; yet once they were rid of despots, they were by far the best of all. While they were oppressed they were willing to be cowards, but when they were freed each one was zealous to achieve for himself" (abbreviated).

As soon as Hellenism, through the coordinated power of the Athenian Empire on the one hand and of Sparta on the other, began to show signs of a greater expansion it was opposed simultaneously by the Asiatic Medes and Persians to the east and by the Semitic Carthaginians to the west who rose up to choke this new civilization. If the Persians had not been beaten by the Athenians at Salamis in 480 B.C., and if Carthaginian Hamilcar the Elder had not been slain in the same year at Himera in Sicily by Gelon of Syracuse, Greece would have been snuffed out by Asia and there would have been no Western civilization as we know it today.

After the disastrous Peloponnesian War which sapped the vitality of Athens, it seemed as though the destructive quarrels of the Greek city-states would dissipate the expansive energies of Hellenism. It took a semibarbarian foreigner imbued with the Hellenic ideal to accomplish by force what the Greeks were unable to accomplish by agreement. Alexander the Great of Macedon (356-323 B.C.), extending to wider horizons his father's dream of ruling over a unified Hellas, had the creative imagination to realize of what achievement Hellenism under his leadership was capable. In 334 B.C. he launched his amazing

* Robinson, C. A., Jr., *Alexander the Great*, p. 20 (E. P. Dutton and Company, Inc., New York 1947).

enterprise, sweeping across Asia with his conquering armies, and in less than eight years passing through the gates of India. In that short period he succeeded in fusing his variegated empire into a flexible political organization composed of every element in the *oecumene*—the whole inhabited world. He established world government under the direction of one leader, with the city-state, self-governing but no longer independent, as the indispensable, vitalizing political and economic cell, upon which the life of the empire depended. Alexander's immediate and principal objective as he advanced was to create a vast network of Hellenic cities, highways, and commerce. He might deem it wise to reinstate Oriental satraps and kings, but his own power rested on the chain of Greek city-states which he planted as economic and cultural outposts no less than as garrisons all over Asia and Egypt. These enduring cells of Hellenism maintained a permanent influence on the Middle East. In the Greek cities which he captured or founded, Alexander invariably installed democratic regimes on the Athenian pattern. Here we have the roots, never to be shaken, of the free municipal system handed down by Alexander's successors to Rome, and by Rome to Byzantium. The oecumenical concept in government combined with the local freedom of the *polis* resulted in a powerful structure which survived the disruption of the Diadochi (Alexander's successors) and without which Roman dominion in Asia would have been impossible. The continued prosperity of the Greek cities was essential to the social and economic stability of the Roman Empire.

One of the effects of Alexander's achievement was the breaking down of language barriers. Aeolic, Doric, Ionic, and Attic Greek might continue to be fostered by local traditionalists, and the Asiatic languages remained natural to the non-Greek members of the empire, but the practical language of affairs from Athens to the Ganges was the *koiné dialektos*, the universal dialect, in which some four centuries later the New Testament was written by Christ's disciples although their Master taught in Aramaic. However, the Oriental mind was refractory to Hellenic positivism as it is today to Western ideas. Thus, at the farthest limits of Alexander's empire, the traces of Hellenism are faintest. Barely 200 years after the Macedonian conquest of India, the last Greek prince there was overthrown. However, scholars wish to detect an Hellenic strain in Oriental art originating allegedly in the vigorous Greek civilization which flourished in Bactria about 250 B.C. (See section *The Arts: Reaction Against Hellenism*.) On the other hand, it is probable that throughout the Roman and Byzantine periods enterprising Greek merchants maintained trading relations with India, as they do today. In Afghanistan an Alexandrine memory survives unrecognized by those who sustain it: a warrior tribe claims descent from a hero of myth named "Aksander." In Afghanistan, Kandahar and Herat, and in Russia, Merv and modern Leninabad, were founded by Alexander under other names, but otherwise the mystic Orient engulfed Hellenic clarity. In Egypt, Alexander built the great port of Alexandria in order to take Mediterranean trade away from Phoenician Tyre. This it did, and under the Ptolemies became the most powerful Hellenic center of commerce in the world. For centuries it rivaled Athens in the field of culture. Ptolemy I founded the great

library containing 700,000 volumes, a museum, and institutions for the study of mathematics, philosophy, geography, medicine, and astronomy. In the Christian era it became a great center of ecclesiastical learning and is still the see of a Greek Orthodox patriarch. Alexandria through the centuries has maintained its Hellenic character and today a populous and thriving Greek community of bankers, brokers, cotton merchants, and businessmen contribute greatly to its prosperity.

Under Rome the Greek *polis* in the Middle East prospered, and Greek influence was correspondingly high throughout the area. When Byzantium succeeded Rome in the East, the Greek Byzantine emperors continued to accord full municipal freedom to the cities of the now Greek empire. The Greek language was official as well as predominant, and the imperial navy protected Greek commerce throughout the Mediterranean. A highly efficient civil service which was the backbone of the empire gave it the *harmonia* (coordination) of which Alexander had dreamed. For more than 1,100 years, with few lapses, Byzantium secured peace, trade, and full personal *Eleutheria* within the *polis* for its citizens in the Middle East at a time when western Europe wallowed in the darkness of the Middle Ages and followed confused patterns of animalism masquerading under the heraldic cloak of chivalry. That the court of Byzantium was sometimes the center of sinister intrigue had little bearing upon Hellenic life as it affected the ordinary citizen who at no period of Mediterranean history attained a greater degree of happiness.

When the Byzantine Empire fell to the Turks in 1453 A.D., the latter, after the first flush of ferocity had subsided, in great part adopted the Byzantine administrative system. They allowed wide municipal freedom to the cities within the Ottoman Empire, and the cities were Greek. The Turks were farmers destined to be served, as their fellow Orientals before them, by the commercial aptitudes of the Greeks. The *polis* still maintained its antique pattern under the crescent of the sultans. It held its meetings in the marketplace and elected its officers. The sea continued to be the source of Hellenic life and activity as it has been since the time of Odysseus, and Greek merchants acquired wealth and power. Of these many were entrusted with positions of the highest authority at the Sublime Porte. Under the rule of the Ottoman Turks the influence of Hellenism, though forced into devious channels, continued to flow throughout the Middle East.

Today Hellenism, centered in a free and united Hellas, is an element of progress in the Middle East, and in the Western World.

ANDRÉ MICHALOPOULOS.

7. ROME AND WESTERN CHRISTIANITY. The history of the relations between the Middle East and Rome is at the same time the history of the development of a civilization unequalled in its universality. This civilization embodies the great synthesis of all basic discoveries in the realm of the human spirit as well as in the relationship between individuals and between nations. This achievement is generally

described as the great Mediterranean culture, which dates approximately from the traditional foundation of Rome (753 B.C.) to the downfall of the Western Roman Empire (476 A.D.). The principles of all basic spiritual and religious human values and of all social and political systems—the entire foundation and heritage of Western civilization—emerge in the course of this development both in their chronology and in their content. Since we can understand this development correctly only in our own historical perspective, that of our Western tradition, it is but natural that all these political and social trends center around Rome as their focus. In this context—looking back toward the ancient cultures and nations and then looking forward to our own history—we perceive the history of the relations between the Middle East and Rome to be at the same time the history of our own tradition. The relation between the Middle East and Rome discloses a twofold significance in world history: in its political and in its cultural aspects.

Rome's political history evolved in constant tension between Rome and the Middle East. Through its political genius Rome succeeded in making use of this tension to sublimate its historical causes, its temporary expressions, and its often dangerous consequences in two syntheses: in the concept of the Roman state and in the universality of the Roman Empire. Thereby Rome proved herself able to stave off the predominantly negative traits of these tensions, primarily expressed in the collectivism and despotism of the Oriental monarchy and in the nationalist separatism of Hellenistic imperialism—an onerous heritage, which, as translated into the Byzantine monarchy and into Eastern Christianity, was left to the Eastern Roman Empire alone to bear.

Even at Rome's cradle the Middle East was present as a godfather, for Rome's early history is primarily a creation of the Etruscans, the first bands of whom probably emigrated from Asia Minor into Tuscany between the 10th and 8th century B.C. By the mid-8th century B.C. the Etruscans seized the town of Rome, the center of a religio-political confederacy of Italic folk called Latins from the name (Latium) of the district, and there they re-created the traditional forms of the Oriental monarchy. After more than two centuries of domination by force, the Etruscan monarchy was expelled and the Roman Republic was founded in 509 B.C. This is the first manifestation of the political genius of Latium. So radically did the early Romans destroy all notions and institutions of Oriental kingly despotism that throughout all their subsequent history not even the word and the concept of "kingdom" could venture to make its appearance as a designation of a political system. And after the republic had evolved into the empire (27 B.C.), not even the most orientally minded among the Roman imperial sovereigns, Diocletian (r. 284–305 A.D.), could dare to call himself "king." They assumed such titles as *princeps* (chief), *imperator* (commander), Caesar, Augustus, but not *rex* (king). With this feat of the expulsion of the kings began the tradition of republican Rome; for all time to come it signaled Rome's fundamental decision against any future attempts to assimilate the political collectivism and despotism of the Oriental monarchy and its successor, Hellenistic imperialism. Thus the groundwork was laid for Rome's most original contribution to the political history of all nations: the autono-

mous and free development of the *res publica* (commonwealth) as a political and social way of life, based on a strict separation of the spheres of *res sacrae* (religious affairs) and *res profanae* (worldly affairs), and on an equally clear distinction between the realms of *res publicae* (public property) and *res privatae* (private property). Thereby the community was safeguarded against all dangers of totalitarianism until the principle of Caesarism transformed the principate (27 B.C.–284 A.D.) into the dominate (284–476 A.D.) or an Oriental despotism. Thus already the first encounter between Rome and the Middle East in the arena of political institutions was decided in favor of the Romans' civic freedom and of the Latin autonomy.

The second great encounter between Rome and the Middle East was caused by Rome's efforts to secure her frontiers and the freedom of her islands and sea lanes. Rome entered the contest among the Mediterranean peoples in defense of her political and economic power and security. Rome's attention was first attracted by the western approaches to the Middle East, the empire of the Phoenician-Punic Carthaginians, who in that era also dominated northwest Africa, Corsica, Sardinia, Spain, and Sicily. After Rome's expansion in Italy had begun, she dispatched her first naval expedition to expel the Etruscans from Corsica (353 B.C.) and concluded two treaties with Carthage for the protection of her exposed coastal areas (348 and 306 B.C.). Then, looking toward the East, Rome was forced to fight Pyrrhus (q.v.) of Epirus, whose Italian invasion was repelled finally by the Battle of Beneventum (275 B.C.). Already in this action the Mediterranean area revealed its geopolitical importance and its role in power politics. Already Rome had grasped the principle which proved to be the basic foundation and final argument of Mediterranean and Middle Eastern policies on into the 20th century, as expressed in the geostrategy and power politics of commanding the sea lanes and coastal areas of the Mediterranean: the principle of pacifying the Middle East and of precluding all attacks waged from the Mediterranean area. This was the precondition for liberty and peace on the European continent and its coastal areas. As a measure of protection against the menace to her flanks of Greek Epirus and African Carthage, Rome entered into a treaty with Ptolemy II of Egypt in 273 B.C. Nine years later she challenged the Carthaginian power in the First Punic War and fought for the possession of Sicily (264–241 B.C.). The cession of Sicily to Rome (241 B.C.) was followed by the Roman seizure of Sardinia and Corsica (238 B.C.). A war of revenge begun by Carthage under Hannibal (q.v.) was won by Rome (Second Punic War, 218–201 B.C.), who acquired Spain and reduced Carthage to a vassal state.

The third fateful encounter between Rome and the Middle East was induced by the imperialism of Macedonia and the aggressive urge of the Hellenistic successors—kings of Alexander's short-lived empire. In the East, Rome first liberated Greece from Macedonian despotism in a war against Philip V (200–197 B.C.). After this Rome fought with Antiochus III of Syria and added Asia Minor to her sphere of political influence (189 B.C.). This was followed by the defeat of the Aetolians (189 B.C.), the subjection of the Galatians (188 B.C.), and the division of the Macedonian possessions into four minor states (167 B.C.) under patronage of Rome, who re-

united these into a province at the end of the Fourth Macedonian War (149–146 B.C.). When Carthage formed an alliance with Syria against Rome, the Romans resorted to drastic measures to counter once and for all the combined threat from the West and the East. In the Third Punic War (149–146 B.C.), Rome destroyed Carthage and proclaimed Africa a Roman province. Revolt in Greece led to Rome's dissolution of the Achaean League and the destruction of Corinth (146 B.C.). Greece was put under the supervision of the governor of Macedonia until at last it attained provincial status. After inheriting Pergamum by will of its last king (133 B.C.), Rome annexed most of Asia Minor as a province (129 B.C.). Cyrenaica also entered the Roman provincial system by a similar legacy (96 B.C.). Sulla's first war against Mithridates VI Eupator of Pontus (88–84 B.C.) was followed by the second under Murena (83–81 B.C.) and the third under Lucullus (74–64 B.C.). When Mithridates had finally been defeated, Pompey founded the twin provinces of Bithynia-Pontus and added to the Roman dominion Syria (64 B.C.) and Palestine (63 B.C.). Caesar brought Egypt (already a Roman vassal since 168 B.C.) under closer control (47 B.C.). Antony in his turn moved into Alexandria, where, however, his reign as an Oriental king and his romance with Cleopatra soon found a bitter ending through the victories of Octavian off Actium (31 B.C.) and at Alexandria (30 B.C.). This third encounter of republican Rome with the Middle East culminated in the proclamation of Egypt as a Roman province (30 B.C.). By then all politically important countries of the Middle East had become Roman provinces.

After Augustus (Octavian's new surname) had become Rome's first emperor (27 B.C.) and had instituted his constitutional reforms (27 B.C.–14 A.D.), republican Rome was definitely transformed into the hierarchical *oecumene* (inhabited world) of the Roman Empire. The new order which settled the administration of the provinces gave the Middle Eastern provinces a large measure of autonomy and administrative independence, but at the same time unified them under a governor general of the East (3 A.D.). With few exceptions Augustus accepted the frontiers of the eastern provinces as determined by Pompey and, in a peaceful settlement with Parthia (1 A.D.), drew the eastern border lines of the Middle East along the Euphrates River, a settlement which essentially lasted throughout the entire history of the Roman Empire. Neither the temporary eastern conquests of Trajan (98–117 A.D.), under whose reign the empire achieved its widest expansion by addition of Armenia, Mesopotamia, and Assyria, nor the vicissitudes of the succession of good and bad incumbents of the imperial throne could mar the blessings of peace and the increasing economic prosperity in the eastern provinces. Although the Roman Empire continued to be based on a slave economy, there is no better illustration of the reality of the ample political and cultural liberties among the peoples, states, provinces, and cities of the empire and of the blessings which they conveyed than the opinion of the Emperor Claudius I (41–54 A.D.), as quoted by Tacitus (*Annales* 11:24): "... that Athens and Sparta were less successful as imperial powers than Rome, because they treated conquered peoples as aliens and refused to incorporate them as members of the state." The political wisdom and liberality which Rome exer-

cised in her treatment of the nations inside the empire was crowned by Emperor Caracalla's (211–217 A.D.) gift of full Roman citizenship to all freeborn inhabitants of the empire. There is no doubt that the groundwork for the political and economic catastrophes which followed and thereby caused the final loss of the Middle East was laid by the steady trend toward absolutism in the political administration of the Middle East and in its economic exploitation, particularly of Egypt, beginning with the 3d century A.D. However, there is little doubt that the epoch of the empire's greatest glory and of its peoples' peace and prosperity (27 B.C.–193 A.D.) is a magnificent achievement due to the genuine forces and traditions of Roman *humanitas* and *universalitas*, of Roman craftsmanship in politics and in the education of nations. The autocratic reforms (293 A.D.) of Diocletian prove how, under the influence of Oriental despotism, political wisdom deteriorated and how the true traditions of *humanitas*, *libertas*, and *universalitas* were abandoned in favor of Eastern servility and collectivism. It is evident that this was the beginning of the end of the historical mission of ancient Rome among the nations of the world, an end which was decided even before the fall of the Western Empire in 476 became a political fact, at the moment when Constantine the Great (r. 306–337 A.D.) left the world metropolis to refound Byzantium as Constantinople (now Istanbul), the "New Rome" (dedicated 330 A.D.).

Outwardly this ends the actual history of the political relations of Rome with the Middle East, since the history of the Byzantine Empire then begins. However, the "Rome without an Empire or Caesars" remained unimpaired and continued to fulfill its historical world mission both of transmitting to posterity its own grand traditions and of blending these with the creative traditions of the Middle East. This was a twofold task, and the effort of accomplishing it kept Rome securely in her position of leadership in the spiritual and intellectual developments at the cultural centers of the Middle East. To give even a sketch of these historical trends, we should have to discuss the history of the Christian theological schools and their councils in the Middle East, as well as describe the imperial history and codifications of Roman law, in which the law schools of the East, particularly that in Beirut, played the leading role.

The basic manifestations and decisive historical consequences of the cultural interrelations between Rome and the Middle East could materialize only by the help of the spiritual universalism of Hellenism and the political universalism of the Roman Empire. Most important of all, Hellenism had created the *koine*, the Greek universal language, as the instrument of mutual understanding by means of the written and the spoken word. The second momentous feature was the political universality of the Roman Empire which safeguarded the freedom of movement within a politically unified space and afforded the technical preconditions for such movement. Rome supplemented the spiritual *oecumene* of Hellenism with the necessary political *oecumene*. In this combination the first visible synthesis of the Greek and the Roman elements was achieved by the medium of the Middle East.

Three basic consequences arose from the cultural encounter of Rome with the Middle East and from the influence of Greek culture on both.

These cultural consequences far surpass in importance the organizational and civilizing influences already mentioned; they were: (1) the personalistic principle of the Hellenistic philosophy of the Stoa and the survival of this principle in the personalistic concepts of man and law in Roman Stoicism and in Roman jurisprudence; (2) the origin and expansion of Christianity as a historic development of religious Hellenism; (3) the emergence of a specifically Roman form of Christianity with its theological-philosophic foundations in the religious personalism of Latin patristic. Because this threefold creative encounter between Rome and the Middle East was destined to become the very basis of Western Christianity and of all Western civilization, we must delve somewhat deeper into these interconnections.

The Stoa may be said to be the least Greek and the most Oriental among all the philosophical systems of Hellenism. All great representatives of the Stoa (with the exception of Panaetius of Rhodes) were non-Greeks. Zeno, the founder, was a Semite immigrant in Athens, and the same is true of his successors up to the time of Posidonius the Syrian. The best modern experts characterize this system as "un-Hellenic" (Pohlenz) and "devoid of even a trace of the Attic spirit" (Wilamowitz-Möllendorff; see *Bibliography*). This characterization also gives us the key to a better understanding of Stoic personalism and its natural-law universalism; for never could a Greek unaided have formed either the idea of justifying the personal autonomy (the "being-into-himself") of the concrete human being or the notion of universal humanity. To be sure, it was in Hellas that the abstract idea of man was discovered and developed by Plato and Aristotle into all fine points of philosophic individualism. But the ego of the physical human being seemed to the Greeks unworthy of philosophical interest, and the same applied to the concrete "I-thou" relationship and its extension to the notion of universal humanity. It is therefore one of the most glorious expressions of the creative spirit of "Oriental" Semitism that, by way of the Stoics from Zeno to Posidonius, it introduced the idea of the human person, of the natural order, and of human liberty into the abstract notion of man as conceived by the philosophic idealism and intellectualism of the Greeks. Where did these Semites find that idea of concrete personalism and of mankind-embracing universalism? In the entire Orient there was, as we know, one nation only which had founded its individual notion of man on the concept of man being created in God's image and of all men being brothers. This nation was the Jewish. (See section on *Hebrew Civilization*.) We therefore are led to believe that the philosophic personalism of the Stoa and its personalistic doctrine of natural law is a legitimate development of the religious personalism of the Jews together with a Hellenistic continuation of Greek philosophy. This view is all the more to be credited, since recent research has shown that the "Semitic linguistic climate" of the Stoa (Pohlenz), and also the numerous linguistic creations of Zeno, stem from Aramaic and Hebrew verbal roots which can be found in exactly the same "quasi-Semitic forms" (Kilb) in one other place only, in the Septuagint translation done by Alexandrian Jews. These facts also explain why the Stoa never could find acclaim either on the part of Greek Hellenism or of Greek Christianity, and

never succeeded in founding a tradition or a school. On the other hand, it becomes more understandable that the Roman spirit—which was always primarily directed toward the concrete character of man and the natural and practicable order of law—found its adequate personalistic philosophy of life and the law precisely in Stoicism. Thus, by way of the religious personalism of the Jews, the Middle East has made its contribution toward the foundations of the Roman theories of the state and the law and the Roman idea of man (Cicero, Seneca, Marcus Aurelius). This in turn proved of decisive importance for the development of the theology and anthropology of Roman Christianity.

Taken merely from the historical point of view, it may be stated that Christianity as a universal doctrine of salvation, and in its development to the status of a world church, was possible only within the spiritual *cosmos* of Hellenism and within the hierarchically organized political *oecumene* of the Roman Empire. We have conclusive proof in the tragic personal fate of Jesus and his original Jerusalemite community of the insuperable obstacles that would have prevented Christianity from developing and expanding in a world of religious and nationalistic separatisms. We find added proof in the literary documents of early Christianity, which show of what surpassing importance was the Greek universal language (the *koine*): first for preforming Christianity in the Septuagint of the Old Testament; later for transmitting the Gospel by the spoken word, for formulating it in writing, for making these Scriptures definitive and for canonizing them; and finally for propagandizing the ideas and doctrines of the Gospel. The same applies to the missionary broadcasting of the Christian message and the founding of the early Christian communities, which would have been impossible without the spatial universality and easy traffic conditions within the Roman Empire. How, for instance, could Paul have inaugurated his world mission, much less have accomplished it, lacking these facilities and the language of the *koine*? The achievements of Peter and Paul give us the clearest insight into these necessary preconditions. The deeds of the two apostles reveal to us the sum total of the spiritual and organizational possibilities realized inside an empire, the only scene on which the original experience at Jerusalem could come to be a world church, a church for all the world. The road of Peter and of the early Jewish-Christian community begins in Jerusalem and reaches its goal in Rome. The road of Paul also has its origin in Jerusalem and, after making the circuit of the Eastern *oecumene* as far as Philippi to organize the original Gentile-Christian communities, it also finds the end of its mission in Rome. Thus, the Epistles of Paul and the Acts of the Apostles are a veritable catalogue of the various possibilities—in ideas, personalities, routes, and localities—offered by Roman universalism and exploited to the full in the process of transforming the early Jewish-Christian community and the early heathen-Christian community into the one and only world church for Jews and Gentiles, where "there is no difference between the Jew and the Greek: for the same Lord [is] over all. . ." (Romans 10:12); "Through mighty signs and wonders . . . so that from Jerusalem, and round about unto Illyricum, I have fully preached the gospel of Christ" (Romans 15:19). As a historical personality Paul is the true type

of the universal citizen of the Roman Empire, "the traveller and the Roman citizen" (Ramsay); as a theologian he personifies the type of the universal apostle of the Christian *oecumene*. "Paul created for the religion of Jesus the form that enabled it to conquer the world" (Lietzmann). In the Roman citizen Paul's realization of his freedom of movement we recognize the spatial width of the Christian *oecumene*, which had its poles in Jerusalem and in Rome. In the Christian Paul's theological concept of man we see preformed the creative synthesis of the religious personalism of the Old Testament with the natural-law personalism of the Stoa to culminate in the Christian vision of the concrete human being, a synthesis on which later the anthropology of Latin Christianity was to build so successfully. It is finally in Rome that, united in their lives and actions, the original apostolic mission of the shepherd Peter and the apostolic world mission of the teacher Paul achieved their ultimate fulfillment in the religious and organizational oneness of the witness and confession of the church itself. In this historical uniqueness of Rome—at the same time the capital of the Christian *oecumene* and of the Roman Empire—we find the deepest confirmation of the creative role played by the Middle East from the origin to the height of the Roman Empire's true universalism.

The same ideas and historical forces which we have found characterizing the creative encounter between pagan Rome and the Middle East also influenced deeply the development of Latin Christianity. First, the entire tradition of Latin patristic has its origin in the Middle East and in Rome herself. Of the four great Latin patristic authors who developed and determined the theology and the anthropology of Western Christianity and thereby laid the foundation of Western culture, three stem from Punic Carthage: Tertullian (160?–230), Cyprian (c.200–258), Augustine (354–430); the fourth, Ambrose (340?–397), was born in Trier of Roman parents. All four are characterized by the typically Roman vital approach which centers on the living person and the actual world and is combined with a strong affection for a natural legal turn of mind and a practicable legal order. This matter-of-fact separation of all natural affairs from their supra-natural sublimization is expressed in Latin theology by the stress laid on distinguishing worldly matters and human frailties from the supernatural and divine order; and it is also expressed in the legal and political thinking of Rome, which strictly divorces *res sacrae* from *res profanae*. Under these conditions the Roman concept of the church could grow in complete independence from the political and administrative powers, and this saved it from the fatal Oriental heritage of theocracy with its emperor-divinity and its Caesaro-papist state church. The stress laid by Western theology and anthropology on personalism—again in conformity with the secular traditions of Rome—implies the unconditional opposition against every trace of Oriental and Hellenistic mysticism and collectivism. Instead, Western (in contrast to Eastern) Christian anthropology and social philosophy are securely based on the religious personalism of the Old Testament and the natural-law personalism of the Stoa. In their philosophical, anthropological, and natural-law theories applied to the concrete person and the concrete state, Tertullian and Cyprian, as also Ambrose and Augustine, are just as much

grounded in the natural-law personalism of the Stoa, primarily of Cicero, as they are grounded in their theological anthropology and Christology on Paulinian personalism. It is especially characteristic that the anthropology and sociology of Latin patristic, besides being fully based on the theological personalism of Paul, which Paul on his part derived from the religious personalism of the Jews and from the natural-law personalism of the Stoa, placed even greater stress on these pre-Christian personalistic elements and traditions of Paulinism and developed them still further. Thus Ambrose especially, in his work on *Duties* (which for more than a millennium became the principal source for Western pastoral theology), accepts Cicero's concept of the Stoic doctrine of duty almost literally and thus exalts the religious personalism of the Old Testament to the function of a general basic concept, when he replaces Cicero's quotations and arguments derived from Graeco-Roman authors by others taken from the Old Testament. Finally Augustine, developing his doctrine from those of his most important teachers, Cicero and Ambrose, completes the great synthesis—of the Stoic doctrine of natural law and anthropology, the religious personalism of the Old Testament, and the theological personalism of Paul—a synthesis which, formulated in the fundamental Augustinian concepts of sociology and anthropology, became the common possession of Western civilization. In their origin and their development over the ages, Western theology and anthropology are personalistic and "Roman." On the other hand, they are deeply indebted to the best creative traditions of the Middle East which have become so important to us through the religious personalism of the Old Testament. Therefore, Western man and Western civilization can subscribe with even greater justification than the East to the old and wise adage: *ex oriente lux* (out of the East, the Light.).

EDGAR ALEXANDER.

8. ORIENTAL CHRISTIANITY. A fundamental difference has always existed between the history, the doctrines, and the eccles-

istical organization of Oriental Christianity in the Middle East on the one hand, and Eastern Christianity of the Byzantine faith and tradition on the other hand. In common parlance the terms "Eastern Church" and "Eastern Christianity" are often used uncritically to embrace all Christian churches of the East and then to distinguish these from the historical complex of Western Christianity. However, the distinctive character of the dogmas and ecclesiastical history of Oriental Christianity sets it apart as a meaningful, historical unit against both Western and Eastern Christianity. We therefore must draw a clear line between the dogmatic unity of "Orthodox Christianity" with its one "Eastern Church" and "Oriental Christianity," which comprises the several "Churches of the East." This is all the more necessary, because in the Middle East of the mid-20th century the influence of the churches both of the West (whether Catholic or Protestant) and of Eastern Orthodoxy within the totality of Oriental Christianity is restricted to a small number of adherents. The two most important churches of Oriental Christianity are the Nestorians in Iraq and Syria, with about 67,000 members, and the Coptic in Egypt, and the Monophysites in Ethiopia, Syria, Iraq, Armenia (USSR), and Asia Minor, with about 7,800,000 members. Only about 390,000 persons belong to the Orthodox patriarchates of the Eastern Church (Alexandria, Antioch, Jerusalem), and only about 870,000 are members of the Uniat churches, which, though in communion with the Roman Catholic Church, are not organized as one body and follow non-Latin rites, such as the Alexandrian, Antiochian, Armenian, Byzantine, and Chaldean. To sum up: there were (1950) in the Middle East about 7,867,000 Oriental Christians, 390,000 Orthodox Christians, and 870,000 Uniat Christians. To this total should be added the numerically very small following of Protestant churches (primarily in the American and British missions), who, however, achieve a social and cultural importance quite out of proportion to their numbers.

The history of Oriental Christianity shows clearly how bleak would have been the historic fate of early Christianity if it had not come under the influence of Hellenism and Latinity. Early Christianity might well have been halted in its theological and dogmatic development on the primitive autarchical level so characteristic of Oriental Christianity but for the traditions created by Paul, the Apostle to the Gentiles. It was he who initiated the selective synthesis of the religion of Jesus with Greek culture, while at the same time "though being a Hellenist himself, he saved Christianity from being submerged by Hellenism" (Schmidt; see *Bibliography*). Likewise, but for the traditions and the original apostolic office of Peter, who established Rome as the doctrinal and organizational center for the nascent ecumenical church, the early church might have become exhausted in that same multiplicity of primitive native churches so characteristic of the structure of the Oriental churches. (It is well to remember that it was Rome which endowed all early Christian communities with the first catechetical formulation of the creed, with the canon of the New Testament, and with the diocesan constitution.) Viewed in historical perspective, this means that without Hellenistic and Roman universalism the young Christian faith would never have been able to develop the world-

encompassing universalism of the *orbis Christianus* (Christian world). Only in this perspective can Oriental Christianity be understood: first in its specific meaning as an expression of the culture of the Middle East, and second in its general function in world history. To be sure, Oriental Christianity takes its legitimate position within the *orbis Christianus*, without, however, expressing and living out the reality of Christian catholicity and universalism. This explains the utter passivity of the role played by this brand of native Oriental Christianity in developing the young church, first when the schools of theologians were formed and the ecumenical councils were held, and later when it became itself an object of church policies (in the struggles between Byzantium, Rome, Persia, and Islam).

The history of Oriental Christianity may be divided into four great epochs: (1) the expansion of Christianity in the Middle East to the First Council of Nicaea (325); (2) the development of the state church and of Greek patristic and their dogmatic condensation (through the councils) to the Council of Chalcedon (451); (3) the rise of the several Oriental churches and their struggle against the Byzantine state church to the victory of the Arabs (647); (4) Oriental Christianity and its separate churches (647 to the present).

Expansion.—The history of the expansion of Christianity in the Middle East also records the general process of Christianity's outgrowing the confines of its provincial Palestinian origin and transforming the early Jerusalemite community into the early Christian *oecumene* (inhabited world) of the Roman Empire. Disregarding Armenia for the moment, we can state that this process occurred almost exclusively in the Hellenized cities and provinces of the Roman Orient, a fact which was of decisive importance for the autonomous development of Oriental Christianity. It appears that Christian teaching and doctrine exerted their influence only within the Hellenistic urban civilization and in those provinces which had come under strong Hellenistic influence. This particularly applies to Asia Minor, which had become Christianized very early because "at least in the Imperial era it was an entirely Greek country of Greek culture" (Holl). The opposite is true of non-Hellenized Jerusalem and Palestine, which accordingly played a negligible role in the early Christian history of the Orient. When the Romans dispersed the Jews (70 and 135 A.D.), the original Jewish-Christian community all but disappeared in the recesses of history, until the Council of Chalcedon accorded it the merely formal rank of a patriarchate to honor its venerable tradition. There were no Christians in Nazareth, Capernaum, Tiberias, and Gaza up to the reconquest of Palestine by Constantine. On the other hand, the numerous Greek cities of Asia Minor and the Hellenized coastal towns of Syria, above all Alexandria and the Nile Valley with the Thebaid, were very early centers of Christian life and doctrine. "Christianity was a city religion, and the larger the city, the greater the number of Christians" (Harnack).

Because of this completely Hellenistic character of the early Greek "city religion," which used the Greek language exclusively, it exerted its influence only on the Hellenistic upper strata of society and never established a vitalizing contact with the tongues and ways of life of the ancient native cultures and the everyday existence of the masses of the indigenous peoples. "No

Greek ever thought of learning a foreign dialect for the sake of Christianity, in order to transmit the Bible to a strange nation. At official occasions the Church always speaks Greek. In the sermons, at the Synods, in literature, on the monuments, this is the only language used. Around 400 A.D., Asia Minor could be said to be just as much Christianized as Hellenized" (Holl). What is true of Asia Minor is even more true of the other provinces and peoples of what was then the Orient. Wherever Hellenism had expanded, there Christianity could penetrate; and conversely, where Hellenism had done little preparation, the success of Christianity was scanty. In other words, in the Oriental provinces of the Roman Empire the majority of the population led a life without Hellenism and, in the religious sphere, also without Christianity. There even was a part of the Hellenized upper strata of society which turned its back on Christianity altogether, adhering exclusively to the pagan syncretism of the Hellenistic mystery cults and losing itself in Gnosticism. Another part endeavored to find an original synthesis in its heritage of Oriental native culture, Hellenism, and Christianity. These attempts evoked all those questionable formations of Oriental-Hellenistic-Christian syncretism expressed in the staggering number and variety of the Oriental-Christian heresies of the epoch, among which Gnosticism and Manichaeism represent only two of the most influential.

Thus, this failure of the early Christian "city religion" of the Romanized Orient to develop into a genuine, vital Christian-Oriental peoples' religion is the main reason for the permanent primitivity of Oriental Christianity. The second consequence was that Oriental Christianity became the never-failing source of all the heresies and popular "tribal" interpretations of the basic doctrines of the Christian religion, to combat and to correct which the ecumenical councils and synods had to devote the main part of their labors. The third consequence was that, instead of Christianity conquering the Orient, the Orient on the contrary became the sole shaping force within this "Christianity" in the Middle East. In the overall view of world history, we see in this failure the chief ethnological and psychological reason for the decisive defeat of the Christianity of the Orient at the hands of the Arabs.

Development.—The era of the Christianization by force of the Oriental provinces begins with the attempt to enforce the canons of the First Council of Nicaea (325) two generations before Theodosius the Great formally declared Christianity to be the state religion (380). What even the most successful Christian communities and ecclesiastical provinces of the Middle East had failed to achieve before the latter date by their free efforts was now forcibly imposed by decree. All organized power of the Byzantine autocracy was applied to administer Christianity to the peoples of the Orient, from the top downward. In this action, the last potentialities of an organic transformation of Oriental Christianity into a genuine, popular religion were lost.

There were two decisive consequences. First, the ruthlessness with which the authority of the Caesaro-papist state-church was applied in the interests of the power politics of Byzantine imperialism so greatly enhanced the nationalistic separatism of the Oriental peoples that the hatred

for the political oppressors was soon also directed against official Christianity. Consequently these peoples were always prepared to form alliances with any non-Christian power for the sake of liberating themselves from the religious domination by a church alien to the country and its people. The exodus of Nestorius to Persia and the surrender of Egypt to the Arabs (642) by the Coptic patriarch, Cyrus of Alexandria, were two fateful examples of this sentiment. Second, these power politics of state and church made it impossible for all the labors of the Greek church fathers of the Orient and also the work of educational and dogmatic criticism and construction rendered by the councils to be utilized for a positive development of Oriental Christianity.

From the point of view of the Oriental Christian churches, the first four general councils of the church (325, 381, 431, 451) were destructive of their ecclesiastical autonomy and theological individuality; the net effect of the councils' decisions was to inhibit any indigenous exegesis of the Christian religion. Thus the First Council of Constantinople (381; see *CONSTANTINOPLE, COUNCILS OF*) had deprived the patriarch of Alexandria of the special honors and the ceremonial rights of his episcopal see founded by Mark the Evangelist. This action was advanced another stage when in 451 the Council of Chalcedon (see *CHALCEDON*) usurped for Constantinople ("New Rome") all jurisdiction over the Oriental churches and the other patriarchates of Antioch and Jerusalem because of the Caesaro-papist lust for power by the patriarch of Constantinople. Somewhat earlier the First Council of Nicaea (325; see *NICAEA, COUNCILS OF*) had proscribed the doctrine of Arius, which had gained a popular following in the Orient; the Council of Ephesus (431; see *EPHESUS, COUNCIL OF*), banned the doctrine of Nestorius; and the Council of Chalcedon condemned the Monophysite doctrine of Dioscurus of Alexandria. The outcome of Ephesus was that the Nestorian Church was definitely founded and took refuge in Persia. The decision of Chalcedon resulted in the final organization of Monophysitism in the Coptic Church of Egypt. In both instances the definitive separation of Oriental Christianity from the ecumenical community with Western and Eastern Christianity was prompted at least as much by the Orient's national and political antipathies against Byzantine imperialism, as it was caused by the fact that the primitive theology of Oriental Christianity could not fully comprehend the theological universalism of conciliar decisions.

With all its aberrations and heresies (Gnosticism, Chiliasm, Montanism, Monarchianism, Origenism, Manichaeism, Arianism, Apollinarianism, Macedonianism, Pelagianism, Nestorianism, Eutychianism or Monophysitism—to mention only the major departures from orthodoxy; see separate articles) the Orient, after all, has to its credit in this period the gigantic accomplishments of Greek patristics—the Alexandrians: Origen, Clement, Cyril, and Athanasius; the Cappadocians: Basil, Gregory of Nazianzus and Gregory of Nyssa; as well as John Chrysostom and the Antiochene school—though the Orient itself failed to derive much profit from these achievements. Perhaps the greatest gift of Oriental Christianity, in addition to its patristic, is the foundation of monasticism (Anthony, Pachomius, Basil), which it transmitted unaltered to the East and in a basic transformation (August-

tine, Benedict) to the West. In the same epoch the scholarly Jerome in his refuge at Bethlehem, in fraternal cooperation with Greek and Jewish scribes, performed the great feat of translating the Bible into Latin for the West (Vulgate).

Rise and Struggle.—The native Oriental churches of Nestorianism and Monophysitism finally parted ways with the rest of Christendom in consequence of the ecumenical decisions on doctrine taken by the councils of Ephesus (431) and Chalcedon (451).

At Ephesus the teachings of Diodorus of Tarsus and Theodore of Mopsuestia, to which Nestorius subscribed, were condemned. They taught that in Jesus two distinct natures (*physis*) were embodied in two persons, that Mary had given birth only to the man Jesus, and that consequently only the man Jesus died on the cross. In this doctrine the traditional Iranian dualism of good and evil, of flesh and spirit, of God and the world, of God and man, were expressed only too clearly, despite all Christian transformation. Therefore, under Nestorius' leadership the predominantly Eastern Syrian Church formed an entirely natural combination with the Persian Church of Ctesiphon in building up a separate and native Oriental church. For over 800 years this church, under the name of the Great Church of the Nestorians, materially assisted by the Persians and Arabs, was the largest Oriental separatist church whose followers, organized in some 20 dioceses, spread far into India and China.

At Chalcedon, 20 years after Ephesus, the Alexandrine thesis propagated by Dioscurus was condemned because it maintained that in the Christ the divine and the human element is united to form the one and indivisible nature (*monophysis*) which is wholly divine in character. In this doctrine there are elements of the ancient Egyptian tradition of the deification of man and also of the doctrine of deification expressed in the Alexandrine *gnosis*. Under the influence of this doctrine even the orthodox Athanasius laid such strong stress on Christ's divinity that his Christology deprived Jesus' quality as a human being of almost all its content. We now see why the Egyptian Coptic Church ("Copt," derived from the Arabic *Kibti-Cupt*, that is, Egyptian) adhered to Monophysitism. In the further process of disintegration of the Byzantine state-church throughout the Orient, the mighty Monophysite church federation—aside from the Ethiopian Church which it dominated—also combined all other native churches, primarily those of Syria and of Armenia. In the mid-20th century Monophysitism still predominates in almost all of Oriental Christianity.

These historical developments in the theological affairs of Oriental Christianity, which left these two heretical churches in possession of the exclusive influence, clearly denote a retrogressive movement to the native religious traditions of these peoples, and consequently a further re-orientalization of original Christianity. And the same conscious retrograde trend toward the non-Hellenistic historical traditions occurred in the social and political fields: a total defeat and suppression of Hellenism-Romanism-Byzantinism by native Orientalism.

Separatism.—Having grasped the meaning of these developments, we now can see why the adherents of these churches had no scruples in supporting the political struggles of the Persians and

the Arabs against Constantinople. This also enabled the purely Oriental religions of Iranism and Mohammedanism to absorb with little difficulties these Oriental "Christians" as soon as the political conditions allowed or enjoined such re-orientalization. This process of political and religious reorientalization of Oriental Christianity was unleashed in the entire Middle East by the decisive victory of the Arabs in 647 and it has continued ever since to gain momentum.

For the Nestorian Church it led to a complete collapse, consummated only in 1919, after World War I, in the Nestorian refugee camps of Ba'quba near Baghdad. Of the erstwhile mighty and glorious Nestorian Church with its many millions of members and its influence reaching as far as China, nothing was left in the entire Middle East save a starving and plague-ridden colony of fugitives numbering about 60,000 souls.

Also of the once just as mighty and glorious Church of the Monophysites, only about 834,000 members live (1950) in Egypt (93 per cent of the Egyptians are Mohammedans) and about 150,000 members of the Syrian and Chaldean rites of the Monophysite Church dwell in the rest of the Middle East. Only the Armenian Church of Monophysitism succeeded in saving itself, with about 2,500,000 followers living in the Armenian provinces of Soviet Russia and 18,000 Armenians settled in the United States. It should be noted that the Armenian Church (q.v.) has one of the most glorious records of all Christian churches. It was the first, and also the only non-Hellenistic, state church of the Orient, founded in the late 3d century by St. Gregory the Illuminator, who baptized Tiridates III, king of Armenia. The one Oriental separatist church to continue unharmed from its foundation about the middle of the 4th century by St. Frumentius into our day, with all the traditions of its memorable and moving history and religious doctrine unbroken, is the Church of Ethiopia, which in 1950 numbered about 3,875,000 members.

9. BYZANTIUM AND EASTERN CHRISTIANITY. The history of the relations between Byzantium (Constantinople) and the Middle East during the height of the Eastern Roman Empire (324–641 A.D.) is essentially the history of the continuous development of the traditions of Oriental Hellenism within the great historical sphere of Eastern Christianity. As

shown in the section on *Rome and Western Christianity*, Rome was able to achieve a selective synthesis, combining her own traditions with the creative traditions of the Middle East in her original creation of Western Christianity and Western civilization, a process in which Rome integrated Hellenism and outgrew it. Byzantium, however, in full contrast to Rome, achieved no more than a quasi-Christian transformation of Hellenism. "This Hellenistic civilization, as it arose in the Near Eastern lands during the centuries which followed the death of Alexander the Great, remained unaltered after the Roman conquest of the Greek kingdoms; it determined the character of civilization in the Eastern Mediterranean under the early Caesars of Rome and it played the same historic role under the Christian emperors ruling from Constantinople" (Baynes; see *Bibliography*). This fundamental difference between Rome and Byzantium in their reactions to the Middle East and to Hellenism was so deep and decisive that it established itself as a permanent principle of political and cultural dialectic within the historical sphere of Christianity—between Christianity's western pole (Rome and the West) and its eastern pole (Byzantium—Moscow). This polarity continues to manifest itself in the present day tensions between East and West. (See section *Russian Messianism*.) In distinguishing the main characteristics of the Roman traditions of the West and of the Byzantine traditions of the East, we form an understanding of the entire structure of the Byzantine political and social system, as being a transformation from a pagan into a Christian manifestation of Hellenistic autocracy and theocracy and of Hellenistic collectivism and servility.

In the West we find the strict distinction between *jus sacrum* (sacred law) and *jus profanum* (secular law) and, in consequence, the rejection of all notions about the divinity and cult of emperors and kings; instead we find the recognition that the realms of the state and politics and of religion and the church each have their own set of rules. Moreover, we find in the West a general rule of strict separation of the political power of the state from the religious authority of the priestly hierarchies—with the spiritual authority of the *rex sacrorum* (king of religious rites) based on these hierarchies. The spiritual rule became visible and workable in the genuine religion of republican Rome in her highest office of priesthood, the *pontifex maximus* (principal pontiff), later paralleled in Christian Rome in the episcopal function of the pope. We find the strict distinction between the realms of *res publicae* (public property) and *res privatae* (private property), and the implied rejection of political totalitarianism and servility in any form as ultimate consequences of the personalistic concept of man and the state. To be sure, in the era of the Roman emperors (27 B.C.—476 A.D.) appear frequent, though temporary, flagrant breaches of these principles, particularly in the emperors' usurpation of the office of *pontifex maximus*, in the imperial god-emperor delusion and the religious cult of the state, and finally in the persecutions of Jews and Christians (largely attributable to this delusion). But these breaches only prove how deep had already become in imperial Rome the intrusion of Oriental Hellenism and how badly threatened by that time were the genuine Roman traditions. When therefore Constantine the Great in 324 A.D. exchanged Rome for Byzantium, this

first Christian emperor symbolically abducted the Hellenistic theocracy from Rome—where it had always remained alien to the true Roman spirit—and thereby practically liberated ancient and Christian Rome from the acute threat of further Orientalization.

In the East the Hellenistic traditions developed the following major characteristics. Secular law became deified in the Byzantine theocracy; sacred law became secularized in the Caesaro-papist state church. This was achieved through the mutual penetration of the political power of the state and the religious authority of the church, a process in which the priestly hierarchy was subordinated to the political bureaucracy. To justify this move, the Byzantine state-controlled theologians invented the famous sophist formula of the politico-religious and religious-political "symphony" of church and state. This was ultimately expressed and justified in the indivisible unity of the autocratic, secular-ecclesiastic sovereign rights and the absolute ecclesiastic-secular office of the Byzantine emperor as *basileus* (king) and *cosmocrator* (lord of the world); this made him the secular incarnation of the creative power of the divine *pantocrator* (lord of all) and the personification of the celestial *dominus et deus* (lord and god). In this order of Eastern Christian Caesaro-papism and Byzantine theocracy genuinely Roman and Western traditions could not flourish. Neither the separation of *res publicae* and *res privatae* nor that of the realms of public, private, and church life was possible. It follows necessarily that all institutions and vital values which depend on the personal separateness of the human being as well as on the natural laws of his individual liberty were non-existent. However, in this Eastern order all traditions of the Hellenistic collectivism of Macedonian imperialism and Hellenistic-Roman imperialism could thrive all the better.

The integration of these two traditions was accomplished in another synthesis, that of Byzantium ("New Rome"), which united the special heritage of her Greek ancestry with the new religious phenomenon of Christianity, to form the new unity of Graecism-Hellenism-Christianity. Herein lies the origin of the novel historical phenomenon, Byzantium, in its threefold historical manifestation: the Byzantine state as autocracy, the Eastern Roman Church as Caesaro-papism, and the religious culture of the East as theocracy. We therefore must not fail to recognize in Byzantium the totality of an original synthesis with worldwide historical consequences. Not only was Byzantium in the realm of politics the historical heir to the empires of the Macedonians and of the Rome of the Caesars; it was also, in the realm of civilization, a creative transformation of Hellenism into Christianity, with a consciously retrograde movement toward classical Hellas, an emphatic rejection of the real Orient, and a selective continuation of imperial Rome. In this triple structure of the Byzantine synthesis, the world of Hellas, of the Orient, and of Christianity at the same time merged into and contrasted with one another in the most varied ways. Here is the source of the utterly complex Byzantine history of political and church forms, which for "non-Byzantines" has always remained a special opportunity for the worst misconceptions. Thus, for instance, the Byzantines proudly called their capital the "Roma Nova" and described themselves as genuine "Romaeans" (Romayos), to

attest that Byzantium was the sole legitimate heir to the traditions of the Roman Empire. However, just as proudly did they call themselves "Greeks," because they largely continued in political affairs the traditions of the *polis* (city-state) and in spiritual matters the heritage of the philosophy of classical Hellas. And in the same way they described their "Eastern" Church as the "Greek Church" and their religious culture as "Greek Christianity," to emphasize their conscious theological and organizational alienation from Roman Christianity and from the non-Hellenistic Oriental Christianity of the Middle East. (See section on *Oriental Christianity*.)

Byzantium represents mainly the totalitarian state organization of the Greek *polis*, which did not know the separation of the realms of religion and the state: "The *polis* had the attribute of sanctity, and the relationship between the citizen and his *polis* was really his religion, as expressed in the various state cults. The Greek gods are not, as are most Semitic gods, the deities of the country and the soil; they are primarily divinities of the politically constituted citizenry. In Greece, religion has no autonomous development* aside from the state with the vital spheres it encompasses. No church can there constitute itself a rival of the state by means of an independent priest caste as in the Oriental empires. The cults of the gods are state cults, the priests are state employees" (Bultmann). This state of affairs in the Greek *polis* had its exact counterpart in Byzantine theocracy, which it therefore was fully justified in calling Greek. This domination of the religious sphere by the political realm, whereby religion becomes identical with the polity and therefore the state also represents the church, as in turn the church represents the state, was especially characteristic of Byzantine theocracy. In this theocracy the unity of sacred and profane law—embodied in the total law of *nomos* (law) in the ancient *polis*—was modified by "Christian" characteristics only insofar as the secular omnipotence of the Greek *nomos* was expanded to embrace the theocratic omnipotence of the Byzantine *cosmos* and found its expression in the equally omnipotent office of representation and domination belonging to the Byzantine emperor as *cosmocrator*. On the First Council of Constantinople in 381 (the Second Ecumenical Council), Theodosius the Great had forced the ecumenical sanction for this status. From that time this thesis dominated the political and ecclesiastical life of Eastern Christianity, unaltered until the end of Russian czarism. "The year 381 is the birth date of the Christian State Church. In fact, only now was the creation of the New Roman absolute sovereign quite complete, who reigned supreme not over the bodies and possessions of his subjects only, but also over their souls and consciences" (Harnack). The texture of this *polis* tradition of Byzantine theocracy was also interwoven with the Hellenistic tradition of the Oriental god-king, which was expressed in the dignity of the diadem and in according the sovereign the honor of the great *proskynesis* (prostration). This sacramental honor, which Alexander the Great assumed from the Persian god-kings, was in turn imported by the first Christian emperor, Constantine, into the ceremonies of the Byzantine theocracy. Ever afterward, even the spiritual head of the Byzantine Church, who occupied the patriarchal throne in Constantinople, had to pay his "cosmocratic"

monarch the honor of the great *proskynesis*. This instance is particularly expressive of the fundamental difference between the Roman West and the Greek-Oriental New Rome of Byzantium: in the West no mortal was thought worthy of the great *proskynesis*; it was not even allowed in the papal ceremonies. Western man may and will not prostrate himself except before God's majesty. Even to the supreme hierarchical dignity and authority of the pope or of a king he offers but the genuflexion of the left knee, while the flexion of the right knee is reserved for God alone.

The theology of the Byzantines, moreover, returns to specifically Greek traditions, in that it is based essentially on the intellectualism of Greek philosophy, especially on the Platonic notion of *logos* (spirit) and on Neo-Platonic mysticism. It is primarily the preponderance of the Alexandrine tradition (from Origen to Athanasius), with its strongly accentuated Christ-Logos idea, which has hindered the emergence of a personalistic figure of Jesus Christ and thereby the foundation of a psychological doctrine of the Trinity and of a concrete theological-philosophical anthropology according to the pattern of Western personalism. Likewise the Byzantine emphasis on asceticism, developed in a straight line from Oriental monasticism with its abnegation of the world and its hostility toward civilization, shows how utterly dependent Byzantine monasticism was on the Hellenistic-Oriental traditions. The same is true of the Eastern Christian doctrine of virtue in contrast to the Western Christian notion of a personal morality. Western morality looks toward the sanctification of man through divine grace and the divine sacraments, as working in everyday life in the concrete individual; on the contrary, the doctrine of virtue and *kenosis* (self-abnegation) as taught by Byzantine mysticism and sacramental impersonalism looks exclusively toward the deification of man in a supranatural realm.

The Roman, or rather the "Romaeon" traditions of Byzantium refer chiefly to those of late Roman imperialism. In ecclesiastical policies the Byzantine state church and its patriarchate of Constantinople (which possesses no direct apostolic traditions) made persistent efforts to subject Roman Christianity and its papacy (as also the autonomous Oriental churches of the Middle East with their venerable traditions) to the political domination of the one and only "orthodox" emperor and the spiritual domination of the "orthodox" patriarchate. On the other hand, the Roman tradition gratefully acknowledged that Byzantium had to its credit the great achievement of collecting and codifying the entire *corpus* (body) of the Roman law (528-534 A.D.). However, this achievement of Emperor Justinian I is also primarily organizational, for the content of the *Corpus Juris Civilis* is exclusively an accomplishment of ancient and imperial Rome. The main work of codification, too, ascends to the juriconsults and the traditions of the law schools of Rome and, particularly, of Beirut. Besides, Justinian's *Corpus Juris Civilis* received no visible sign of interest from Byzantium and its Eastern successors, including Russia, and left no mark on them. They all contented themselves with a typically Byzantine commentary and a short, watered-down excerpt from the Codex, the *Basilica* of Leo VI the Wise (886-912).

The epoch of Byzantium's political history in

which its face is turned toward the Middle East is essentially the time of the substitution and the liquidation of the heritage of Roman imperialism, to which as Romaeans the Byzantines believed themselves to owe allegiance. This period comprises the rise and decline of the Eastern Roman Empire from the foundation of Constantinople (330) to the Arab conquest of Egypt (642) in the reign of Emperor Constans II. The period is characterized by the effort of the Byzantines to extend the sphere of Roman imperial domination in all directions within the Middle East and to carry to an extreme the dictatorial government methods of Roman Caesarism. Various elements combined to form the closely knit unity of totalitarian state bureaucracy, state economy, and political despotism which through more than a millennium (324-1453) dominated the political and social life of Byzantium: in politics, the pattern and practice of the kingly despotism of the Syrian Seleucids; in economics, the slave and liturgical systems of the totalitarian state economy of the Egyptian Ptolemies; aided by the intricately elaborate tax system and absolutistic administration of Diocletian's bureaucracy. Since the indigenous peoples of the Middle East had been accustomed to such systems of force under their ancient traditions of Oriental despotism as well as under Macedonian and Roman imperialism, the Byzantines all the more could concentrate their efforts on defending and expanding their imperial reign on their borders. In the course of these efforts the Byzantines succeeded during Justinian's reign (527-565) in expanding their domain into Africa, southern Spain, and all of Italy in the West; into the Balkans, Asia, and Armenia in the East. But at the same time the imperialism of the Romaeans emperors of Byzantium which was directed against Western Rome contributed greatly toward the gradually increasing exhaustion of the Eastern Roman Empire, which left the Middle East a prey, temporarily to the Persians and in the end to the Arabs.

The internal exhaustion of the driving forces both of Byzantine and of Neo-Persian imperialism had momentous historical consequences. First, the New Roman imperialism was so weakened that the West was spared the fate of permanent Byzantinization. Second, Byzantium protected the European continent, as well as the Balkans and the Middle East, against the threat of being submerged by the barbarism of the Vandals and other Asiatics. Third, Byzantium in its two centuries of struggles with the Sassanids preserved the peoples of the Middle East from having their own cultures and religions, including Oriental Christianity, destroyed by Neo-Persian fanaticism and imperialism. Fourth, the mutual attrition of the forces of Byzantine and Neo-Persian imperialism made the ascendancy and final victory of the Arabs possible, by which the Middle East regained the freedom to return to its original historic traditions and way of life. Thus, through the dialectics of world history, Byzantine imperialism, unwillingly but decisively, contributed to the indirect liberation of both Europe and the Middle East.

EDGAR ALEXANDER.

10. BIRTHPLACE OF ISLAMIC CIVILIZATION.

Arabia, called the "cradle of Islam," is the birthplace of all Islamic civilization. The founder of Islam was an Arab—Muhammed, q.v. (570-632 A.D.; Arab. Muhammad), who exercised his mission and lived his whole life within the boundaries of the Arabian Peninsula. However much he may have borrowed from Jews and Christians with whom he came in contact in his early life, the background of his thinking was the life of his contemporary Arabia, and his mental outlook was that of a 7th century Arab. His preaching was in Arabic and was addressed to Arabs. His Koran, q.v. (*Qur'an*), which he intended to be the scripture of the new religion, was in Arabic. The cultus he worked out for his religious community was framed in terms of Arabian life in his own day. His early converts and most of the important figures in the earliest period of Islam were Arabs. The caliphs, their advisers, and the leaders of the great movement which created the far-flung Islamic Empire were all Arabs. With the expansion of that empire went the Arabic language (q.v.) and much of the pattern of Arab life as the Prophet Mohammed and his companions had lived it. Prayers were to be recited in Arabic throughout the world of Islam; scripture was to be read in the same language. The Kaaba, q.v. (Qibla), to which men were to turn in prayer five times daily, was the shrine in the holy city of Mecca in Arabia, the same shrine to which yearly ever since there have converged the pilgrim caravans bringing converts from all corners of the growing Islamic world to make contact with the spiritual center of Islamic life in Arabia.

Thus we see the tremendous influence which the Arabian connection has had on every aspect of Islamic civilization. It was not long before non-Arabs were more numerous than Arabs in the Moslem (Muslim) community. As the former entered the Islamic fold, they naturally brought with them from their own cultures many contributions which enriched, and in some measure molded, the developing Islamic civilization. Yet the Arab element has always been dominant and has given the characteristic form to the whole. In many places the languages of the conquered peoples were superseded by Arabic; but

even where they resisted supersession, they were in every case strongly influenced by Arabic. New peoples entering the Moslem fold began to write their local dialects in the Arabic script in spite of its unsuitability for non-Semitic languages. Hence it has followed that not only the Persian and Turkic dialects, Urdu, Pushtu (Pashto), Panjabi, and Malay, are commonly written in a modified form of the Arabic script, but in more recent days Hausa, Fulah, and Nubian in Africa, Tamil and Malayalam in south India, and Moro in the Philippines have been written by the Moslems in those communities in a script based on what to them is the sacred Arabic. The influence of the Arabian connection on literature, art, and architecture, on dress and social customs is too well known to need more than a reference. A curious point, however, is the way in which the more prominent families among new peoples converted to Islam soon begin to produce genealogies connecting themselves with Arab stock.

The new religion which Mohammed preached in 7th century Arabia made so sharp a break with the older life of that country that his successors were wont to call the pre-Islamic days "the time of ignorance," interpreting literally the word *jāhiliyya* which Mohammed had used in his preaching with reference to that earlier period. They were, indeed, times of ignorance of Islam, but not, as so many later writers have suggested, times of barbarism; there existed at that time in the "cradle of Islam" a considerable culture which made important contributions to the succeeding Islamic civilization.

No archaeological expeditions have been permitted to work freely in Arabia, nor indeed has even surface exploration been possible save at a few scattered spots, so that even in the mid-20th century we have no adequate knowledge of early Arabia. A number of Palaeolithic sites have been noticed by travelers, as well as a few Neolithic sites, showing us that the peninsula has been inhabited more or less continuously from the Old Stone Age. The little available evidence from skeletal remains suggests that in prehistoric times there were three racial stocks in the peninsula, the earliest being akin to the proto-Negroid stock found in early times throughout the belt stretching from Malaysia to Africa. Upon this proto-Negroid stock there descended from the north two waves of migration, one bringing round-headed people of the Armenoid stock, and the other long-headed people of the Mediterranean stock. When we reach historical times there is material evidence of contacts between peoples from Arabia and the early civilizations of both Egypt and Mesopotamia; but it is not until the term *Arabi* begins to appear in Assyrian inscriptions from the 8th century B.C. that we can speak of evidence of contacts with Arabs in our sense of the word. Peoples from Arabia were also in touch with the Holy Land in early times, for in the Bible we find mention of the Arabs proper.

This early evidence depicts the Arabs as a camel people, interested to some extent in the carrying trade, but more interested in raiding. They were organized into tribes and tribal confederacies under chiefs or chieftainesses, and for the most part preferred a nomadic to a sedentary life. Their fierce love of independence was remarked on by the Assyrian monarchs, who referred to them, as did Alexander the Great at a later date, as those who had never submitted to

any great king. Their penchant for raiding made them a thorn in the side of those charged with maintaining the security of settled populations, and their ability to slip back into the wilderness made them a people peculiarly difficult to control. Representations of them on Assyrian monuments show them naked except for a breechcloth, with polled heads and short, pointed beards, fighting two to a camel, with bow and arrow and short spear. Their tents with the camp appurtenances and their small cattle are hardly distinguishable from those of the modern Bedouin.

But if the northern Arabs at that time were for the most part nomadic, predatory tribes, those of the south had a highly developed urban civilization, with great temples and palaces, a highly organized and stable social system, and an advanced economy based partly on agriculture and partly on sea trade from the Orient. Goods were then carried overland up the "Spice Road" to the northern markets where, they could be traded to Mesopotamia, Egypt, and the Mediterranean lands. From their northern contacts, these Arabs from the south learned to write in an alphabet derived from the same origin as the Phoenician alphabet, and which in their own land they developed into an elegant monumental script. Inscriptions of about 800 B.C. have been found in south Arabia, but these are written in a beautiful regular script which tells of an already long period of development. Fairly recent excavation in the north uncovered a broken pot with a short inscription in these south Arabian characters, found in a context which it is believed cannot be later than 1000 B.C.; therefore we may assume that this southern civilization dated from at least 1500 B.C. Several features of this culture clearly show Mesopotamian influence, but its architecture, its social organization, and its religion seem to be genuinely native developments.

From the inscriptions we are able to learn something of the history of five kingdoms in south Arabia: the Minaean, Sabaeen, Qatabanian (Katabanian), Hadramautic (Hadhramautic), and Awsanian. Inscriptions in Minaean and Sabaeen have been found in considerable numbers at various sites in northern Arabia where the southern Arabs had established stations to handle that end of their trade. A few inscriptions found in as remote regions as the island of Delos and the Nile Valley suggest the extent of that commerce. About the 1st century A.D. a number of factors combined to impair their trade monopolies so seriously that from then to the rise of Islam there was a progressive decay in this south Arabian civilization. One result of this deterioration was the sporadic migration northward of groups of south Arabian origin, thus establishing the basis for that constant conflict between northerners and southerners which became so important a factor in later Islamic history. A second result was that the somewhat chaotic conditions in the south brought first the Abyssinian and then the Persian occupation in the century preceding Islam.

In the north we find no such advanced civilization until much later. Although migrant Arab groups had succeeded in establishing dynasties in a number of important centers such as Palmyra, Hatra, Emesa (Homs), Edessa (Urfa), Adiabene, and in Ituraea and the Characene, the basic populations over whom they ruled seem to have been non-Arab. The first traces of a truly Arab settled civilization in the north appear with the

Nabataeans, whose centers at Petra, Bostra (Bosra), Salkhad, Gerasa (Jerash), Damascus, Taima, and Gerra became famous enough to gain mention in non-Arabian history. They too were interested in the carrying trade, but also had an agriculture based on cistern and conduit irrigation. They built well-planned settlements and forts to protect their trade routes, carved great temples out of solid rock, developed a characteristic style of architecture and a pottery which for delicacy and beauty of form and decoration had no rival in the Near East, and from the 3d century B.C. to the 2d century A.D. they enjoyed a civilized life on a level with that of the eastern Mediterranean cities. Though Arabs by race, they learned and used Aramaic as their language for literary expression, developing their own modification of the Aramaic alphabet, thus providing the basis on which the Arabic script later was developed. Their art, coinage, architecture, and even their religion show that they had been considerably influenced by Hellenism. At Adra'a and at Bostra they even introduced Greek games. We can trace the record of their kings from about 169 B.C. until 106 A.D. when under Trajan their kingdom was incorporated in Provincia Arabia. Josephus bears witness to the involvement of their kings in Palestinian affairs, and it was from the territory of one of their rulers, Aretas IV, that St. Paul made his escape (II Corinthians 11:32). Three other little kingdoms in north Arabia are known to us from inscriptions which were written in north Arabian dialects but in an alphabet borrowed from the south Arabians. These were the so-called Lihyanian, Thamudic, and Safaitic kingdoms which belonged to the last years B.C. and the early centuries A.D. They too, especially the Safaitic, were strongly influenced by Hellenism. In Byzantine times we again find a number of similar small kingdoms, though in these the important elements were groups which had migrated from south Arabia. The most famous of them were the Lakhmids who centered at Hira (al-Hirah) on the Euphrates, the Ghassanids who ranged from Damascus down to the Dead Sea, and the Kinda and Ribab in central Arabia. The Sassanids of Persia used the Lakhmids and the Byzantines used the Ghassanids as buffer states to protect their territories from the incursions of the nomads, with the result that these two groups served as channels whereby Iranian and Byzantine influences penetrated far into the peninsula. It is astonishing to note the array of culture words of Iranian, Aramaic, and Greek origin which can be gathered from the Koran and the old Arabic poetry.

The religion of pre-Islamic Arabia was basically the old Semitic paganism. There were sacred stones, trees, waters, and numerous holy spots where a sacrificial cult was practiced. There were male and female celestial deities associated with the sun, moon, stars, and heavenly phenomena. Of special importance was the fertility cult of the great mother goddess, who had a variety of names but was al-Lat (*the goddess, par excellence*), and who had various consorts at the different shrines. The ancient shrine at Mecca was a center of her worship in primitive times, but in the years immediately preceding Islam it had come to be a manner of pantheon for all Arabia where there were images of all the gods. Priesthoods appear to have been unimportant in ancient Arabia, but the soothsayer

(*kāhin*) and the poet (*shā'ir*), both of whom under inspiration spoke oracular words, words of wisdom, words of weal or woe, were important personages. The Ghassanids had, for the most part, become Monophysite Christians, and important elements among both the Lakhmids and Kinda were associated with Nestorian Christianity, so that through them Christianity apparently was fairly well known both in north and south Arabia. (See section *Oriental Christianity*.) Colonies of Jews were to be found in nearly all the oasis settlements along the trade routes, and both in south Arabia and in the north they attained a position of considerable influence. In Medina at the time of the hegira (622), there were three important Jewish groups who played no inconsiderable role in the affairs of the city. There were certain Gnostic sects active in the area east of the Jordan, and the religion of Zoroaster no doubt had some influence on Arabs settled near the Persian Gulf. During the 6th century we have evidence of a strong movement toward monotheism in the north of the peninsula, some memory of which has been preserved in the Moslem tales of those individuals whom they called the *hanifs*, and in the stories of a number of rival prophets with whom Mohammed's successor had to deal.

Any developed civilization, however, was only possible at a relatively few favored spots in the Arabia of that day. The greater part of the country was not sufficiently fertile to permit cultivation and sedentary life. Even the extraordinarily efficient irrigation engineering of the Nabataeans had not permitted them to push any great distance into the desert areas. For this reason the characteristic life of pre-Islamic Arabia was, as it has continued to be, the nomadic life. In the earlier period the inhabitants must have been ass-nomads similar to the type pictured on the 12th dynasty wall painting at Beni Hassan in middle Egypt. The effective domestication of the camel, however, enabled them to overstep the limitations imposed by dependence on the ass as a means of transport, and opened to them practically the whole Arabian Peninsula. The structure of nomad life was simple. The people were dependent on their herds, which in turn were dependent on water and pasturage, so that seasonal migration was determined by pasturage needs. The family was the unit of social life. A combination of related families was the tribe, authority over which was invested in the sheikh and his council of elders. Tribal confederacies often were formed, but they were stable only so long as some powerful leader could hold the groups together. The tribes were in constant conflict, and raiding had become almost a national sport in spite of the fact that it led to the dreaded blood feud.

The only forms of cultural expression generally found in such nomadic life were music and poetry. Of old Arabian music we know very little, but the sayings of the tribal wise men were famous even in ancient days, and a considerable body of verse attributed to pre-Islamic poets was collected by the Moslem savants of the Abbassid period. This verse bears witness to the extraordinary richness of the Arabic vocabulary, but it was a one-sided richness. There was an overabundance of words to express even minute distinctions of things that interested the nomad as part of the experience of his daily life—hundreds of words for camel and all that pertains to the

camel, for the date palm and its parts, for the desert and all concerned therewith, for the well and its water, for the nomad's natural emotions of love, fear, and anger, but remarkably few words for the world of ideas. Almost all the culture words, words for things of the spirit, words for the luxuries of more civilized life, were borrowed from Aramaic, Greek, or Iranian. (See also ARABIC LANGUAGE; ARABIC LITERATURE.)

It was into such a world that Mohammed came, bringing his message which united the Arabs as the spearhead of the movement that produced the Islamic Empire and with it the Islamic civilization. See also ISLAM; and section within this series on *The Arts*.

11. THE ARAB CALIPHATE: ITS RISE AND DECLINE. Successorship to Mohammed.

—On that memorable day, June 8, 632, when the Arabian Prophet Mohammed (q.v.) rather unexpectedly passed away, the newly born Moslem community was confronted with its first serious problem, that of successorship (*khilāfah*, caliphate). As long as Mohammed lived he performed the functions of leader, judge, army commander, and head of the state—all in one. The question now was who should succeed him in all these functions except that of prophecy, for he, as the last (*khātam*) of the prophets, could have no successor. This question of the caliphate, the oldest in Islam, has remained a living issue until the 20th century when the Kemalist Turks abolished its Ottoman phase and several pan-Islamic congresses were subsequently held in Mecca and Cairo to determine the rightful heir, but all without success.

The Patriarchal Period.—The aged abu-Bakr—father-in-law of Mohammed, member of his tribe, the Quraysh, and one of the earliest and more respected believers—was by a form of loose election declared successor, thus ushering in the first series of caliphs, that of the Orthodox (*rāshidūn*), so called because they followed closely in the footsteps of the prophet. The seat of this short-lived caliphate (632–661) was Medina, the city of the prophet. The conduct of these caliphs was unostentatious, patriarchal, and mostly inspired by religious motives. During the reign of abu-Bakr (632–634) the entire peninsula was brought under the sway of Islam. Arabia had to conquer itself before it could conquer the world outside. The enduring achievement of the third caliph, Othman ('Uthmān, 644–656), was the codification of the Koran (*Qur'ān*), which fixed the "word of Allah" for all time. The official version compiled under his auspices achieved canonical veneration throughout the world of Islam. During the reign of the second caliph Omar ('Umar, 634–644), who was the ablest of the group, the banner of the new faith was carried triumphantly eastward to Persia, westward to Barca in North Africa, and northward to the Taurus. At first intended primarily for booty, rather than permanent conquest, these raids developed into military campaigns that netted for Islam an empire that was to extend in the Umayyad (Omayyad) caliphate from Spain and France in Europe to Turkestan and India in Asia, covering all North Africa. Such rapid and brilliant successes at the expense of the two

world powers of the day—Byzantine and Persian—were astounding not only in themselves but in their results. They ultimately changed the course of history.

The Theocratic Caliphate Becomes a Secular Power.—The first wave of Arab conquest was interrupted by the civil war between the fourth caliph, Ali ('Alī, 656–661), son-in-law of the prophet, and Mu'awiyah, governor of Syria and member of the aristocratic Umayyad branch of the Quraysh. Mu'awiyah (661–680), shrewd and realistic, "one of the four geniuses of Islam," wrested the caliphate from its legitimate incumbent Ali, established his seat in Damascus, provincial capital of Byzantine Syria, and ushered in a new series of 14 caliphs. He nominated his son Yazid as his successor, thus introducing the hereditary principle, built the first navy in Islam, and used it for the conquest of Cyprus, Rhodes, and other islands. His army he modeled on the Byzantine pattern. From Egypt as base his generals overran the Barbary states; from Syria they marched across the Oxus (Amu Darya) and Jaxartes (Syr Darya) into central Asia. On two occasions he stretched his mighty arm across the "land of the Romans" as far as Constantinople. It was he who changed the character of the caliphate from a theocratic to a secular system and established a model for his successors to follow.

Damascus at Its Height.—The caliphate established by Mu'awiyah attained the zenith of its power under Abd-al-Malik (685–705) and his son, al-Walid (705–715). It was then that the nationalization of the Moslem state was effected through the change of the language of the public registers (sing. *diwān*) to Arabic—from Greek in Syria and from Pahlavi in Iraq and Persia; and through superimposing on the current Roman and Persian coins Koranic superscriptions or replacing the coins by new silver and gold Arab pieces. The architectural monuments of these two caliphs include the Umayyad Mosque of Damascus, the Dome of the Rock and al-Aqsa (el-Aksa) Mosque in Jerusalem. All three are still standing and rank among the finest in Islam. Jerusalem was and still is considered the third holiest place in the Moslem world, after Mecca and Medina. Moreover, al-Walid built at state expense homes for the lepers, the blind, the lame, and others afflicted with chronic diseases, the first of their kind in the annals of public health.

It was during the illustrious caliphates of Abd-al-Malik and his sons that the Arab Empire reached its height from Tours in northwestern France to Kashgar in Chinese Turkestan, an extent equaled by only few empires in history. Spain, in the course of those conquests, was brought within the embrace of Islam, where it remained in full or in part for over seven centuries; the Indus Valley was subdued and its conquest, after a long period of checkered history, eventualized as late as 1947 in the newly formed state of Pakistan. For the first time vital contact was established with a new ethnic element, the Turks, destined to become the great champions of militant Islam in eastern Europe.

Baghdad: an Intellectual Center.—The year 750 witnessed the inauguration of a new caliphate, that of the Abbasids, with whom the center of gravity in Islam shifted from Syria to Iraq. The Abbasids were so named from an uncle of the Prophet Mohammed. Their assumption of power

was consequent to their victory over their Umayyad rivals in the Battle of the Zab, a tributary of the Tigris. On the Abbasid side, Shi'ites ('Alids), Persians, pietists, and malcontents were arrayed. The Abbasid dynasty was the longest-lived (750-1258) and the most renowned of all the caliphates. Its orientation was Persiaward. Persian viziers, Persian wives, and Persian wines became especially conspicuous in the caliphal court. The destruction of the caliphate by Hulagu and his Mongolian hordes in 1258 brought to an end the Arab Empire.

The real founder of the Abbasid caliphate was the second in the series, al-Mansur (754-775), who built Baghdad. In a few years after its foundation, this city developed into an emporium of trade worthy of its position as successor of Ur, Babylon, and Ctesiphon. That was in the day of Harun al-Rashid (786-809) and his son al-Ma'mun (813-833). When still a crown prince, Harun conducted the fourth and last campaign against Constantinople and exacted a humiliating tribute from its ruler. Al-Ma'mun established in his capital a remarkable institution, Bayt al-Hikmah (house of wisdom), which was a combination of academy, library, museum, observatory, and translation bureau. He sent emissaries into the "land of the Romans" in quest of manuscripts, and patronized scholars, mostly Syrian Christians, who rendered Greek works into Arabic, often through Syriac. The period of translation from Greek, Syriac, and Persian lasted for about a century (c.750-c.850), in the course of which, Arabic, hitherto an imperfect tool of expressing scientific or artistic thought, came to possess the chief works of Aristotle and the Neo-Platonists in philosophy, the masterpieces of Hippocrates, Galen, and Paul of Aegina in medicine, the major treatises of Euclid and Archimedes in mathematics, and the principal composition of Ptolemy in geography. Hunayn ibn-Ishāq (Lat. Joannitius, 809-873), member of the Eastern Syrian Church, was the dean of translators; his interest lay in philosophy and medicine.

Original Contributions.—The period of translation in part overlapped and on the whole preceded a longer period of origination in which Arabic-writing scholars made their contribution to science, art, literature, philosophy, law, and linguistics. Jābir ibn-Hayyān (Lat. Geber, fl. 776), an Iraqi, produced a number of works that entitle him to the distinction of being the father of alchemy (itself an Arabic word, of ancient Egyptian origin). Al-Khwārizmi, Persian by nationality, produced (c.830) a book in mathematics, entitled *al-Jabr*, which was the first of its kind. Another Moslem scholar of Persian origin, al-Rāzi (Lat. Rhazes, 865-925), distinguished for the first time in the history of medicine between measles and smallpox. Ibn-Sīna (Lat. Avicenna, 980-1037), son of an Assassin from Bukhara, produced a medical work *al-Qānūn (The Canon)* in which he recognized the contagious nature of tuberculosis. A Damascene physician, ibn-al-Nafīs (d. 1288), had an elementary conception of pulmonary circulation centuries before the Portuguese, Michael Servetus, credited with the discovery, was born. It is no exaggeration to claim that between the middle of the 8th and the beginning of the 13th century, Arabic, once the language of a few tribes in Arabia, had developed into a position of leadership in scientific, philosophic, and literary thought throughout the then civilized world.

In Spain.—The main treasures of science and literature which the Arabs in the East had acquired through translation or research were gradually passed on to the West, to Spain, which had been conquered (711-718) during the Umayyad caliphate and had become the seat of a local Umayyad dynasty independent of Baghdad. The dynasty enjoyed its heyday under Abd-er-Rahman III (912-961), who proclaimed himself caliph in Córdoba in 929. He thereby inaugurated a rival caliphate to that of the Abbasids, who had another rival in the Fatimids of Tunisia and Egypt. This Fatimid caliphate (909-1171) was the only major Shi'ite caliphate in the annals of Islam. A general of one of its early members built Cairo—which soon became the seat of the caliphate—with its al-Azhar Mosque, which has maintained its position until the present day as one of the earliest and largest centers of learning in the world. It was with this caliphate that the Crusades had to contend for the mastery of Palestine.

Under Abd-er-Rahman and his son al-Hakam II (961-976) the golden age of western Islam was enjoyed. Besides most of the Iberian Peninsula, Abd-er-Rahman's empire embraced a large part of North Africa. Al-Hakam's emissaries ransacked the East and West for books for his library, which reportedly contained 400,000 volumes. He is said to have established 27 free schools in the capital and enlarged the university in its mosque founded by Abd-er-Rahman I in 788. Moslem scholars in Spain built upon the intellectual foundations laid by their coreligionists in the East and produced some of the outstanding philosophers, scientists, and physicians of medieval Europe. Ibn-Rushd (Averroës, 1126-1198) of Córdoba became "the commentator" on Aristotle as Aristotle had become "the philosopher." Ibn-al-Baytār (d. 1248) of Malaga wrote the foremost treatise on botany in which 1,400 plants were considered. Ibn-al-Khatib (1313-1374) of Granada emphasized the infectious nature of the Black Death, which was ravaging Europe, when most people considered it an "act of God." Granada was the seat of the last of the petty states that arose on the ruins of the caliphate (929-1031). It survived until 1492, when it was destroyed by Ferdinand and Isabella.

Toledo: Center of Translation.—Toledo in the mid-12th century developed into an important center for translating Arabic works into Latin mainly through the interest of Archbishop Raymon. The algebra (*al-jabr*, whence the English word) of al-Khwārizmi was first translated by Robert of Chester and with it were introduced the Arabic numerals and the zero or cipher (both Arabic words). The commentaries of Ibn-Rushd were done into Latin by Gerard of Cremona, who also translated the surgical works of Abul Kasim al-Zahrāwī (Lat. Albucasis or Abulcasis, d. 1013), the most distinguished surgeon Spanish Islam produced. These medical treatises were used in Oxford as late as 1778. The medical schools of Montpellier and Salerno, in France and Italy, also used textbooks originally written in Arabic. Michael Scot translated in Toledo a number of Arabic astronomical works. The names of a number of stars in European languages are of Arabic origin. Scot also worked in the court of Frederick II in Sicily who, like his predecessor, the Norman Roger II, patronized Arabic learning. Frederick founded

the University of Naples, which used as textbooks translations of Arabic works. Before the Normans, Sicily had been occupied and held by the Arabs (c.827-1091).

Of the three bridges—Spain, Sicily, and crusading Syria—through which Moslem learning and elements of Arab culture found their way into Europe, Spain was undoubtedly the most important. These elements, it is no exaggeration to say, contributed vitally to the reawakening of Europe and setting it on the road of modern progress. (See also ARAB PHILOSOPHY; ARABIC LANGUAGE; ARABIC LITERATURE.)

Other than the four Sunni caliphates (of Medina, Damascus, Baghdad, and Córdoba) treated above, there was a late major caliphate, that of the Ottoman Turks in Constantinople. When Sultan Selim I in 1517 destroyed the Mameluk rule in Egypt, he found in Cairo a shadowy caliph, al-Mutawakkil, who claimed descent from the Abbasids. This series of nominal caliphs in Egypt had been started in 1261 by al-Mustansir—an uncle of the late Abbasid caliph in Baghdad—whom the fourth Mameluk, Baybars, had invited from Syria and installed in his capital with great pomp. Neither al-Mustansir nor any of his successors exercised any real authority in state affairs. The Mameluks (1250-1517) had superseded the Ayyubids in the rule of Egypt. The Ayyubids were descendants and successors of Saladin, who in 1171 had destroyed the Fatimid caliphate. Selim took along with him to Constantinople al-Mutawakkil. The claim that this puppet caliph transferred his office and title to the Ottoman sultan is legendary, but the fact remains that the Turkish rulers in Constantinople gradually absorbed the Arab caliphal privileges and title. In 1924, Mustafa Kemal (later Kemal Ataturk) deposed the last caliph of Turkey, Abdul Medjid (Abd-al-Majid), and thereby destroyed the entire institution. See also section on *Nationalism*.

12. RISE OF THE TURKISH EMPIRE.

The Battle of Manzikert (modern Malazkirt, eastern Turkey) in 1071, in which Alp Arslan, Seljuk Turkish ruler of Iran (Persia), decisively defeated the Byzantine emperor, Romanus IV Diogenes, marked the beginning of the permanent settlement of Turkish peoples in Anatolia (Asia Minor) on a large scale. Smaller numbers of Turks, which had preceded the Seljuks in the Abbaside period, had been absorbed by them. The major Seljuk dynasties, in Anatolia or Iran, endured for about two centuries. Turkish immigration continued, however, and a subsequent revival of Turkish power in Anatolia early in the 14th century under the Ottoman dynasty led to the capture of the great Byzantine capital of Constantinople by the Turks in 1453, and within a remarkably short time, to the rise of the Ottoman Empire to a dominant position in the areas of the Middle East, the Balkans, the Mediterranean, and North Africa.

The peoples who created this great state were originally members of various nomad tribes of central Asia who, leaving behind them the more

sedentary elements, had gradually migrated in a generally westward direction within that vast area, then had by degrees flooded over adjoining regions. Ever in search of pastures for the horses, sheep, and cattle on which their existence depended, pushed from place to place by other powerful, competing tribes, clustering when they could along the fertile banks of rivers and lakes, driven at times by drought to desperate migratory surges—upon reaching a region such as Anatolia, in which they could establish themselves permanently, they gradually lost their nomad characteristics and became sedentary.

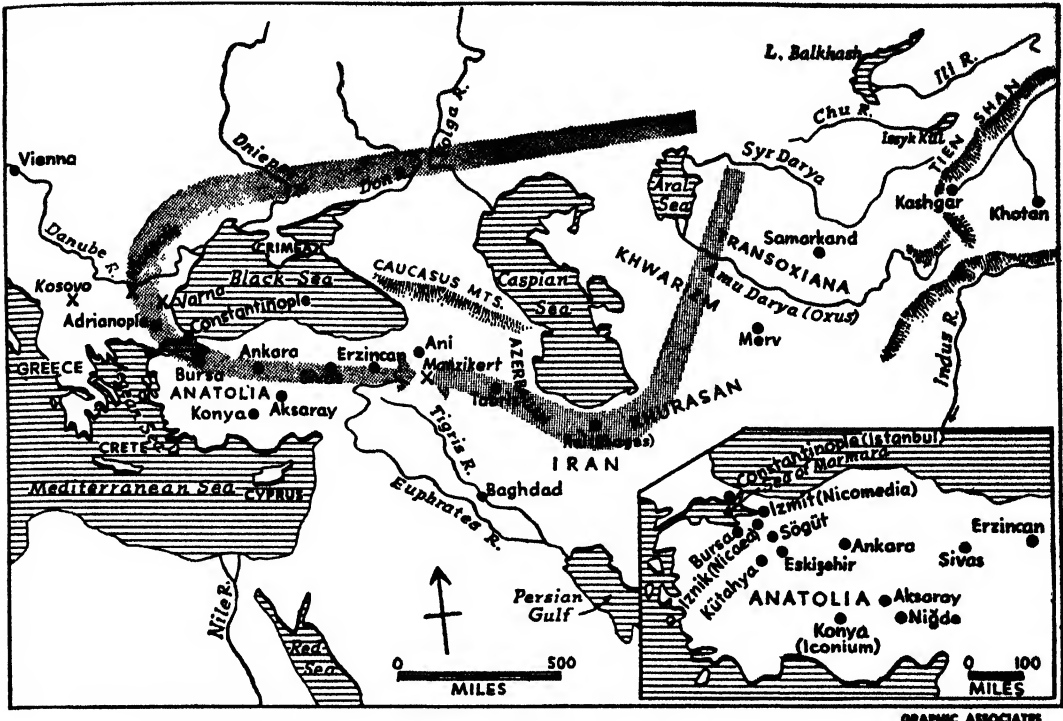

The famous appellations of "Seljuk" and "Ottoman"—two among many other shorter-lived Turkish dynasties—were derived from the names of dynastic founders of particular ability and good fortune, whose descendants were able to give their names to powerful, organized states. It should be remembered that the term "Turk," since the 6th century, has been a linguistic term applied to the widespread peoples speaking the Turkish family of languages.

A modern result of the widespread migrations of the Turks in former times is that there are fewer Turks living within the borders of the Turkish Republic than beyond them—in central Asia, Turkestan, Iran, the Caucasus, the Crimea, and along the Volga—some of the more easterly groups still living the nomad life of their ancestors.

Early Turkish Peoples.—For early accounts of the nomad Turkish tribes in the immense area of Mongolia and central Asia we are forced to rely chiefly on Chinese, Iranian, and Indian sources to complement the old Turkish traditions and such remains as the Orkhon inscriptions dating from the 8th century A.D. and found in 1899 south of Lake Baikal. Even before 1400 B.C. Chinese sources mention ancestors of a nomad people in Mongolia called the Hiung-nu (Hsiung-nu). About 209 B.C. these, and later other Turkish peoples living farther west, were united by Mete, leader of the Hiung-nu, who led his people in an invasion of northwestern China in 201 B.C., which they dominated for about 80 years. Defeat by the Chinese emperor, Wuti, and intertribal rivalries then led to a decline of Hiung-nu power, and about 60 B.C. the Western Hiung-nu migrated to the region north of the Aral Sea, or Lake Aral, which they reached in 36 B.C. From here, in the 4th century A.D., they migrated still farther westward, reached the Danube, and in the next century penetrated deep into Europe, the inhabitants of which knew them as the "Huns" of Attila.

In the early 4th century some of the Hiung-nu remaining in Mongolia participated in the conquest of northern China, where they were absorbed. Others, in the 5th century, moved westward, settling as had the Western Hiung-nu around the Aral Sea. Here, merging with what were perhaps older Turkish inhabitants of the area, the Ghuz (Ghuzz—more correctly Oghuz), they later gave rise to the great Ghuz people who were to play the chief role in the settlement of the Turks in Anatolia.

The period of Hiung-nu was followed by the rise and fall of the power of other Turkish peoples, notably the Avars, but the most brilliant period occurred after the establishment of a powerful state (5th to 8th centuries) in central Asia by the Kōk Türk—called "Tu Kiu" by the Chi-

THE TURKS IN THE MIDDLE EAST

This map illustrates the accompanying article. The shaded arrows show the approximate routes traveled by the two divisions of Ghuz Turks, in the 10th and 11th centuries, from the Aral Sea region to the battlefield at Manzikert (1071). The Moslem Seljuk Ghuz had traveled east and south of the Caspian Sea through Iran; the non-Moslem Ghuz had moved north of the Black Sea and had entered Anatolia as auxiliaries of the Byzantine Army. The width of the shaded arrows is a matter of convenience, and it is not to be inferred from them that the two divisions of the Ghuz were of the same strength.

The inset shows Anatolia in greater detail, in order to illustrate the history of the Rum Seljuk state after 1071 and the Ottoman Empire of the 13th to 15th centuries.

nese—whose influence was felt as far west as the Amu Darya and the Black Sea. The homeland of these Kōk Türk was in the mountainous regions of the central Tien Shan in the vicinity of the Issyk Kul (Issiq Köl), the large lake in what is now Soviet Central Asia, near the western border of the Chinese province of Sinkiang.

According to Turkish traditions about the Emperor Shu going back to the 4th century B.C. (known by Mahmud Kashgari in the 11th century), the Ghuz lived in the region of the Ili and the Chu. Later Turkish sources report them still in the Ili basin but also further west in modern Kazakhstan (Kazakh SSR) on the banks of the Amu Darya and the Syr Darya and between Lake Aral and the Caspian. Khwarizmian traditions, quoted by Al-Biruni (11th century) mention them as living east of Khwarizm neighboring the As and Pechenegs who lived west of that country. These references explain Strabo's "Ἀσσοὶ καὶ Πασαγοὶ" (XI, 8, 2) and Ptolemy's mention of Ὀξείανοι as east of Χωράσμοι (VI, 12, 4). Thus it appears that even in the 1st and 2d centuries A.D. the Iranian As (Alan) and Turkish Pechenegs were west while the Ghuz were east of the Khwarizm clan. After still another Turkish people, the Khazars, had reorganized a powerful state between the Don and the Volga in the 7th century, the Ghuz living along the lower Syr Darya and between Lake Aral and the Caspian came under their sovereignty.

The Seljuks.—By the beginning of the 10th century many of the Turkish peoples had become

Moslems. As great an Islamic scholar as al-Farabi (d. 950) was a Turk (probably a Turkoman or Qarlug). But the Ghuz Turks, under Khazar rulers who had accepted Judaism about 740, began to be converted to Islam only in the second half of the 10th century. The Ghuz chiefs, whose title was *yabgu*, had come under the influence of Judaism through the Khazars, although the Ghuz people as a whole had remained shamanist. In 922, however, one of the Ghuz nobles, who commanded the armies with the title of *sübashi*, received an Arab mission the secretary of which was the famous traveler Ibn Fadlan. His successor became Moslem, a notable event, for Seljuk Sübashi, a member of the same family, broke with the *yabgu* who remained loyal to the Khazars and led the tribes under his rule in a migration east of Lake Aral to the country of the Moslem Turkomans on the lower Syr Darya. His sons, the Seljuks—taking this name from their father—toward the end of the 10th century became involved in a struggle between the Turkish Moslem Qarakhan (Karakhan) dynasty which ruled the regions of the central Tien Shan and Kashgar (now in Sinkiang), and the Iranian Samanid dynasty which ruled central Transoxiana, the country northeast of the Amu Darya. In the beginning the Seljuks under their *yabgu* Israel aided the Samanids, but on the battlefield they went over to the side of the Qarakhans and were thus responsible for transferring Transoxiana from the Iranian Samanids to the Turkish Qarakhans in 999.

Shortly after this event there occurred a general westward movement of Turkish peoples under population pressures from the east, as described by Sharaf az-Zaman and al-Marvazi in the 12th century. About 1030 most of the Ghuz (some 600,000 families in 1048) who had remained loyal to the Khazars migrated with the Pechenegs north of the Black Sea, then south to the Balkans. Here some were conscripted into the Byzantine armies, as were some of the Pechenegs, and later fought against the Moslem Seljuk Ghuz in the campaign which ended in the Byzantine disaster at Manzikert in 1071. The Byzantine writer Michael Attaliates noted that the language, attire, and methods of war of the Seljuk Ghuz were precisely those of the "Scyths" (that is, the Pechenegs and Ghuz, or "Uz" as they were then generally known) in the Byzantine service. The fact that many of the "Scyths" deserted to the forces of Alp Arslan was a factor in his victory.

A second result of the population pressures from the east was that the Seljuks were forced to leave their lands east of the Amu Darya in 1035 and to migrate west of that river into Khurasan (Khorasan), southeast of the Caspian Sea. Here the Seljuks came in conflict with the Ghaznevids, a Turkish dynasty which had replaced the Samanids and which, following the extensive conquests of Mahmud of Ghazni (r. 999-1030), ruled over most of the great territory between the Tigris, the Amu Darya, and the Ganges. In 1040 at Dandanaqan in Khurasan, the Seljuk brothers, Chagri (Chagir or Chagar) and Tugrul (Toghrul or Tughril), the sons of Michael (the latter's name, like those of his brothers Israel and Moses, must have come to the Seljuks through the influence of the Judaistic Khazars) defeated the Ghaznevid armies. They thus opened the way to a swift conquest of Iran by the Seljuks and the foundation of a Seljuk state.

Tugrul (r. 1037-1063), an orthodox Moslem, also brought under his protection al-Qa'im, member of the dynasty of Abbasid caliphs at Baghdad whose power, faced with the rise of the Shi'ite Moslem sect, had dwindled to almost nothing. Until that time the Ghuz had called their chiefs *yabgu*, but Tugrul for the first time in Islamic history separated the temporal power from the spiritual. He left the religious power to the Abbasid rulers as "caliphs," while he assumed for himself the title of "sultan," meaning the holder of temporal power. Tugrul established his capital at Rhages (Rai or Rayy), the ruins of which are near the modern Iranian capital of Teheran, and in time the highly developed Iranian culture reasserted itself. The Turkish sultans became patrons of art and learning, and much of the actual government was in the hands of the great Iranian vizier, Nizam-al-Mulk (1018-1092).

Tugrul's nephew and successor, Alp Arslan (r. 1063-1072), extended the Seljuk domain by conquering Khwarizm, northeast of Khurasan, as well as the lower Syr Darya region, which had been the homeland of the Ghuz. Thereafter he took under his rule the remnants of Khazar Turks, whose state had collapsed as a result of the great westward migratory movements. In 1071, having defeated the Byzantine emperor, Romanus IV Diogenes, at Manzikert, Alp Arslan established the smaller Rum Seljuk ("Roman" or Western Seljuk) state in central Anatolia, side by side with the great Eastern Seljuk state already established in Iran.

Rum Seljuk State.—The Seljuk sultans of Rum, the heirs of Suleiman, a grandson of the *yabgu* Israel, whom Alp Arslan had made the ruler of the new state, remained under the domination of the Eastern Seljuk state in Iran only during the reign (1072-1092) of Malik Shah, the son of Alp Arslan. Then, as the Eastern Seljuk state began to disintegrate under the impact of civil wars, the sultans of Rum declared their independence, devoting themselves to taking over parts of Anatolia from the Byzantine Empire and to making the area a Turkish and Moslem country.

Central Anatolia (Lycaonia and Cappadocia), which Strabo (XII, 6, 1) had described as a steppe with little water but very suitable for raising cattle and especially sheep, became an ideal home for the Seljuks and the nomad Ghuz, and a firm base for their future expansion. The Seljuks had brought with them a great number of Iranians who immediately began the process of Moslemizing the newly occupied cities, and building mosques, Moslem universities, fortresses, and bazaars in the Iranian Transoxianan style, thus erasing the older patterns in these areas. The main element on which the Seljuks depended for repopulating the cities, however, was composed of Khwarizmians and the civilized Turkish element which had lived near Khwarizm and on the lower Syr Darya. These were the peoples that the Seljuks had brought with them when Alp Arslan had made conquests in that area resulting in their deportation. Also in the entourage of Alp Arslan and Suleiman were several princes from the Qarakhan dynasty (whom the Seljuks, as mentioned above, had once helped against the Samanids), and at a later date in the entourages of other Seljuk sultans were noblemen and scholars from Khotan (Hotien, Sinkiang, China). The architecture and irrigation system, as well as the agricultural methods and implements, of the villages and cities established by the Turks in central Anatolia (especially in the regions of Konya, Aksaray, and Niğde) were those of the civilized Turks who migrated there from eastern and western Turkestan. Since the great majority of the Turks who occupied Anatolia were Ghuz, however, other Turks arriving from the east quickly acquired the Ghuz dialect.

To the east, until the invasion of the Mongols, the Seljuk frontiers were successfully defended, but the sultans had to contend with sporadic attacks from the west, not from the Byzantine Empire, which was never to recover fully from Manzikert, but from the Crusaders. The Seljuk capital of Nicaea (modern Iznik), which the Seljuks had captured in 1081, fell to the Crusaders in 1097; Iconium (modern Konya), to which the seat of government was moved, fell in 1190. These were temporary setbacks, however, and in 1235, upon the death of Alaeddin Keyqubad (Ala-ud-din Kaikobad) I, the Seljuk domain included all of Anatolia, with the exception of several minor states which paid tribute, one of these being Nicaea.

Meanwhile, however, the Mongols of Genghis Khan, beginning about 1219, had overthrown Mohammed, the Khwarizm shah of a Turkish dynasty whose rule had replaced the Eastern Seljuk state in 1157; and in 1243 the Mongols launched their attack on the Rum Seljuk state, defeating Giyaseddin Keykhusrev (Ghiyass ed-din Kaikhosrau) II between the cities of Sivas and Erzincan and bringing Seljuk independence to an end.

John III Vatatzes, Greek emperor at Nicaea—the city of Constantinople having been in the hands of Latin conquerors since 1204—came to terms with the Mongols and extended his borders considerably in central Anatolia at the expense of the Seljuks. Although the Mongols retired after advancing as far as Ankara (Angora), they intervened more or less directly in Anatolian affairs thereafter, particularly after Hulagu, a grandson of Genghis Khan, settled in northwest Iran and established the Mongol Il-khan (subordinate khan) dynasty, under which Mongol viceroys were appointed for Anatolia. Hulagu also ended the Abbasid caliphate in 1258.

During the era of the Il-khans, which began in 1256 with the conquests of Hulagu, and ended effectively in 1336 with the death of Musa, Turkish Anatolia, together with Azerbaijan, constituted the backbone of the Il-khan state. It was this period which marked the second stage in the Turkification of modern Turkey in terms of culture and population. More than two million Eastern Turks and a number of Mongols came in the wake of Hulagu and the result of this influx of such a large mass of Eastern Turks was that the older elements were driven westward to the Mediterranean and Marmara coasts, while the Greek population was compelled to emigrate to Greece and Macedonia. The Byzantine historian, Georgius Pachymeres, described this as “the evacuation and migration of the Christians and the occupation and settlement of the Turks.”

The descriptions and accounts given in the letters of Rashid al-Din (1250?–1318), a Jewish vizier of the Il-khan period, show that the Il-khans created new settlement areas in Anatolia by opening canals in the Tigris-Euphrates region. The secret of the subsequent success of the Ottomans, who, after establishing a new state which succeeded the Seljuk state, extended their power to the Balkan Peninsula, can be explained in the fact that the Tabriz-Constantinople commercial road became an extremely busy artery of trade, and that the entire area between Tabriz (now in Iran), Ani (its ruins are near the USSR-Turkish border), Erzincan, Ankara, and Eskişehir (these last three in modern Turkey) became a vast new area of settlement.

The Ottomans.—Records concerning Osman (or Othman—whence the word Ottoman) and his son Orkhan (Orchan) were not collected until a century after the former's death, and by that time it was already difficult to establish past events with accuracy. It was said that Osman's father, Ertogrul, had been a tribal chief whose father had moved from a place called Mahan and had settled in Akhlat after the armies of Genghis Khan had overrun Khurasan. There is a story told of Ertogrul's unexpected arrival on the scene of a battle between the Seljuk sultan, Alâeddin Keyqubad I, and the Khwarizm shah, Jalal ad-Din, successor to the Mohammed overthrown by Genghis Khan, and of Ertogrul's throwing his forces on the side of the sultan, who was on the point of being defeated, thereby helping him to victory. The facts related are shrouded in darkness, but nevertheless reflect historical truth. Mahan, the place mentioned in these chronicles, is the name of a town lying to the west of the ancient city of Merv (now Mary, Turkmen SSR), which had long ceased to be remembered at the time the chronicles were written. The fact that the name appears at all is evidence that genuine facts are recorded. Ac-

cording to the chronicler Idris Bitlisi, Ertogrul was rewarded for his decisive action in the battle by being made overlord (*sahid*) of the district of Söğüt, in northwestern Anatolia near the cities of Bursa (or Brusa) and Kütahya. The potentialities of such a position on the eastern borders of a weakened Byzantine Empire, which would not emerge from the foreign domination of the Latin Christians until 1261, were to be fully realized by the Ottoman dynasty.

Osman (r. 1288–1326), who succeeded his father as lord of Söğüt, began the gradual but persistent expansion of the Ottoman domain toward the Bosphorus and the Black Sea, Bursa falling to his forces after a lengthy siege (1317–1326). Nevertheless, since he is listed among the beys who paid tribute to Germeyan Oghlu, bey of Kütahya, who was himself paying a tributary tax in 1314 to the Mongol viceroy, it is apparent that Osman was at that time merely a tribal chief linked to the Mongol Il-khan rulers through several intermediaries.

Orkhan (r. 1326–1359) continued his father's policies of gradual encroachment on the Byzantine Empire with such success that at the time of his death the Ottoman domain had been increased to about three times its extent under Osman. Nicaea was captured in 1331, and Nicomedia (modern İzmit) in 1337 or 1338. With the latter conquest, the Ottoman domain reached to within 60 miles of Constantinople. Orkhan's inscription on the mosque at Bursa shows that his title was still that of bey (noble), but there can be no doubt that he acquired complete independence toward the end of his life. During the reign (1359–1389) of his son, Murad I, there was no question of being tributary to any ruler to the east, the Il-khan state having come to an end. Murad I inherited an excellent army and a well-organized state which dominated the Anatolian landbridge between Asia and Europe and, overshadowing the remnants of the Byzantine Empire, allowed the Ottomans to intervene in Byzantine affairs.

The Ottoman conquests in Thrace on the European side of the Byzantine Empire as early as 1357, in the last years of Orkhan's life, were probably due to the beginnings of plans for the eventual conquest of Constantinople, the greatest and most strategically located city of that section of the Middle East. Verses prophesying that the Turks would one day conquer the Byzantine capital were compiled long before the event took place. In the copies of an Arabic work, written probably by Abi ibn-Ali Bakr al-Haravi, a scholar from Herat, there is a passage attributed to the prophet Mohammed which may be translated: “How great an emir, and how lucky his army, is the emir named Mohammed who is destined to conquer Constantinople.” This passage is contained in copies published even in the time of Orkhan. After the fall of the city to Mohammed II (1453), a tablet inscribed with it was placed on the door of the church of the St. Sophia.

There is no doubt that the sons of Orkhan, who conquered Edirne (Adrianople) in 1361 and made it their capital, were persons imbued with a great ideal, who knew their ultimate goal. The steady decline of Byzantine power and the easy conversion to Islam of the Turkish tribes which had settled in the Danube Basin along the Black Sea coast, made the Ottomans, who were born courageous fighters, believe that ultimately they would beget “the sultan who joins the two con-

tinents and two seas," making Constantinople their capital. The sieges of that city (1391-1395 and 1397), the steady expansion of the empire in the Balkans under the Ottoman sultan, Bajazet (Bayazid) I (r. 1389-1403), and his victory over the Crusaders at Nicopolis in 1396 were due to this ideal, as well as to the steady increase in the Turkish armies, which were absorbing the warlike Turkish and Tatar tribes both north and south of the Black Sea. Bajazet also extended his domain eastward in Anatolia, until by 1395 it included Sivas.

The struggles among the petty feudal states which had replaced the Il-khan power east of Bajazet's realm made it possible for the Turk-Mongol conqueror Tamerlane (Timur), who had already established a great state with its capital at Samarkand, to gain easy victories over them. This, and the fact that several rulers had taken refuge with Bajazet when their lands were conquered by Tamerlane, tempted the sultan to take over many of the eastern provinces, a task which appeared easy. The result, however, was a conflict between Bajazet and Tamerlane over Sivas and Erzincan. Tamerlane, who had planned the conquest of China, seriously tried to avoid a conflict which meant becoming involved to his west, but the outcome was the Battle of Ankara in 1402 in which Bajazet was taken prisoner by Tamerlane and died in captivity, while his domain was plundered by Tatar armies as far as Bursa.

Although this setback retarded the conquest of Constantinople for about half a century, the struggle between Bajazet and Tamerlane initiated a broad cultural exchange between Eastern and Western Turks, and two important results were that Qadi Zadei Rumi, a Turkish scholar, went to Samarkand to study mathematics in the university founded by Ulug-Beg, Tamerlane's grandson, and that Ali Kushcu, a great mathematician from Turkestan and a professor of the same university, came to the Ottoman lands to develop learning. Many other intellectuals, craftsmen, and painters were also attracted from the east. The tangible results of these cultural exchanges were the Green Mosque and the mausoleum in Bursa built during the reign (1413-1421) of Mohammed (Mehmet) I, a son of Bajazet.

In spite of 20 years of civil wars and attacks on the Ottoman Balkan possessions from the north following the Battle of Ankara, the rapid disintegration of Tamerlane's empire after his death in 1405 permitted an unhampered revival of Ottoman power under Murad II (r. 1421-1451), a son of Mohammed I. His victories at Varna (1444) and Kosovo (1448), re-established the Ottoman position in the Balkans.

The empire, which had become a great power in the northwestern Middle East under Murad I and was restored to that position by Murad II, next became a power of global importance with the conquest of Constantinople in 1453 by Murad's son, Mohammed (Mehmet) II (r. 1451-1481). It reached perhaps its highest point under Suleiman the Magnificent (r. 1520-1566), at whose death the Ottoman domain in Europe extended nearly to Vienna on the west and beyond the lower Dnieper River into the Crimea on the east; in Asia from the Sea of Marmara to the Persian Gulf by way of the Tigris-Euphrates river system, and including Palestine and the Red Sea coast of Arabia; in Africa from Egypt along the Mediterranean seacoast into Algeria. The decline of the empire, when it set in at the end of the 17th

century, was gradual, a decay from within, accelerated toward the end, in the 19th century, by the twin forces of European imperialism and nationalism acting on the supranational Ottoman state. Nationalism grew strong not only in the Balkans, where by the beginning of World War I little remained of the great Ottoman domain, but also in the Middle East. In this region the remaining Ottoman possessions were stripped from the empire following the war, and the concept of nationalism finally triumphed in Turkey itself in a pro-Turkish but anti-Ottoman movement resulting in the abolition of the sultanate in 1922 and the establishment of the Turkish Republic in the following year.

13. EUROPEAN IMPERIALISM. The more ancient history is studied, the more evidence it gives of commercial relations and cultural symbiosis between the Near and Middle East on the one hand and the Near East and Europe on the other. The main route along which such exchanges have passed is the Mediterranean sea-way; on these waters the vital international carrying trade has, in general, been in European hands since Phoenician times. Such, certainly, was the usual case in earlier Moslem times, and such it remains today. Century by century, significant advances were made in the design of Mediterranean ships, in navigation, and in the techniques of naval warfare; but no truly fundamental change in the importance of this sea to mankind's culture and commerce—from the European shores of the Atlantic to the Red Sea, Persian Gulf, and on to India—took place until western European enterprise discovered the alternate all-sea passage direct to Middle Eastern ports via the Cape of Good Hope. This discovery was commercially and politically so important that it was immediately exploited on a large scale. Only two years after Vasco da Gama returned from the first all-sea voyage to Calicut (1499), a sizeable Portuguese fleet already lay at Lisbon with a valuable cargo of Middle Eastern pepper and spices, while concurrently, a Portuguese war fleet had reached the Red Sea in order to protect the new India route and block any trade which still sought to go by the time-honored routes by way of Alexandria and the Mediterranean.

This fundamental alteration in world trade patterns suddenly and irretrievably upset many vital, long established balances. In the Atlantic, Portugal's triumph attracted the competition and enmity of successive, stronger rivals. Finally it was to be France and England who, as they struggled for commercial dominion in the Middle East, were drawn into combinations with, and responsibilities toward, local Middle Eastern powers, until at last the Indian Empire became the brightest jewel in the crown of the English queen-empress. England's successes naturally entailed control of the vital shores along the India route; accordingly, she became a Persian Gulf and a Red Sea power as well.

In the Mediterranean, the effects of the exploitation of the Cape route to India were even more immediately disruptive than they were in India itself. The commercial empires which Italian maritime states, especially Genoa and Venice, had maintained in the Levant prior to this time were

now, at one stroke, robbed of most of their important India trade, while the Moslem states in the Levant, which had traditionally profited from the overland sector of that trade's transit, suffered no less loss. Among these Moslem states the balance of power was so swiftly and profoundly disturbed as to evoke a speedy displacement of traditional rivalries and conflicts. No longer was the usual alignment in the Moslem Near East to be Egypt plus Syria on the one hand, as against Mesopotamia and Persia plus Asia Minor on the other. Instead, Persia, under the Safawid (Safavid) dynasty (1501-1736) and also in a measure in direct contact with western Europeans who came to her down the Volga as well as up from the Persian Gulf, now emerged as a Shi'ite Moslem entity and so established that essential identity which has distinguished the Persians from all other Moslem peoples to this day.

Farther to the west, the Ottoman Turkish Empire of Constantinople for its part reacted to the new situation by immediately conquering the Mameluke Moslem state of Syria (1516) and Egypt (1517), thus bringing the central Arab world under its own rule. Henceforth it was the Ottomans who attempted, frequently but ineffectively, to regain for the Levant that valuable overland Indian trade which the opening up of the Cape route had so largely diverted into western European hands.

Europe's commercial enterprise in the Levant—the Moslem Levant and the Greek Orthodox Levant as well—had in general tended to take the form of more or less formally chartered companies, which, in pursuit of trade, maintained permanent representation and stations (called "factories") at principal Levantine ports and even in a few important commercial centers inland. The presence of such foreign colonies in Levantine lands had naturally created many problems, and had ultimately evoked a systematized procedure for regulating the status and for stipulating the privileges and responsibilities of resident non-Levantine traders as against the native populations and governments of the Levantine world. These regulations were ordinarily embodied in treaties negotiated either between a Levantine sovereign and the European sovereign of a Levantine colony, or else between the Levantine sovereign and the European chartered company itself; treaties of this description were customarily drawn up in sections (*capitula*), whence the modern term "capitulations." This term is unfortunately open to misinterpretation, for the original meaning was by no means that a weak Near Eastern sovereign "capitulated" in granting what amounted to extraterritorial rights to stronger western European trading states in his realms, but quite the opposite: namely, that for his own convenience a Near Eastern sovereign rid himself of the need to trouble with the detailed affairs of an insignificant colony of this sort, and instead entrusted the conduct of those affairs to the colony and to its own ultimate sovereign or charter holder overseas. (See also section on *The Law of the Near and Middle East*.)

A comparable system of factories, colonies, and capitulations extended also to India as western European sea commerce exploited the direct sea route thither, eventually to displace local Indian governments and develop into a European imperial power ruling local subject peoples. In the Near East, however, matters did not go so far. Instead, local authority—represented principally

by the Ottoman sultan and the Persian shah—for long decades remained strong enough to confine western European interests more closely to primarily commercial objectives.

But eventually the Ottoman Empire, the last powerful champion of the nearer Orient against Europe, also grew weak. The date best marking the turn of this tide is probably 1683, the year of the second and last unsuccessful Ottoman attempt to take Vienna. Prior to this, in their relations with European powers the Ottomans, although often temporarily defeated, had not suffered the loss of a major territorial gain once it had been consolidated and incorporated into their state. After 1683 the exact opposite became the case. Thenceforth, although often temporarily successful against European power, the Ottomans were always finally pushed back and forced to give up territory to one or another of their European foes.

In consequence, those capitulations traditionally accorded Europeans by the Ottoman sultan (and which had always to be renewed upon the accession of a new sultan) took on a wholly new connotation, although they retained their traditional wording and form. The transaction now became in truth the "capitulation" of a weaker Near Eastern power in granting extraterritorial rights to stronger European powers which were not only commercially interested in the Near East but also were frequently intent upon imperial gains which were much more than simply commercial in scope.

True, after 1683 the Ottomans continued grimly in their attempt to resist European power, but they were now completely imprisoned and purblind within the total horizons of their own Moslem culture and civilization and so—like almost the entire Near East of the time—they long failed to realize that their European foes had assumed so new an aspect that the traditional Moslem means and methods of conflict were no longer adequate to hold Europe off. Thus responsible opinion within the central Moslem world proved fatally slow in realizing that Europe, as it coalesced into national states, strengthened by a profoundly effective industrial and economic revolution and increasingly motivated by belief in such concepts of human destiny as liberty, fraternity, and equality, was also coming into possession of a totally new and unheard-of degree of power, together with the means to deliver that power, on schedule, to even the most distant field of conflict. This tardiness in apprehending the nature of new realities in Europe was, moreover, all the more fatal for the Moslem world since various ideas and techniques from western Europe were already being received or appropriated by non-Moslem minorities within Moslem lands with comparative alacrity. At the same time western Europe was finding in itself not only the means but also the motives to extend its commerce, and often its direct political control, to ever more remote regions of the globe.

Thus, long before Napoleon's Egyptian venture (1798-1799) at last aroused responsible Near Eastern authority to a rudimentary appreciation of the new European challenge which it had to confront, England was already firmly established in India and Habsburg forces were making continuous gains in the Ottoman Europe. Russia, too, after suffering an initial check when Peter the Great attempted to descend directly into the Balkans, had begun to come down through the

Caucasus back door and to use Persia as a not entirely unwilling tool against Turkey, at the same time laying the groundwork for Russian advance into Moslem central Asia.

Thus the main outlines of the 19th century's Eastern Question (q.v.) had already become plain by Napoleon's time. The traditional frame of reference was to regard the Near East as being a "problem," that is, which Western imperialist Great Power was to gain control, political or commercial, in a given region of the nearer Orient.

Two of the major imperialist contenders were, for the most part, involved in the question overland and hence were primarily interested in making territorial annexations: Austria-Hungary and Russia. Two others were concerned with the question principally in a maritime sense: England and France, and these nations also had interests in the farther Orient, so that the central Moslem world also became for them the route of vital imperial "life-lines." Certain key areas and points thereby took on new significance as important foci of Great Power ambitions, rivalries, and strategy in the 19th century Near East: (1) the Straits area, the Dardanelles, Marmara, Constantinople city, and the Bosphorus, and with them the mouths of the Danube, the Crimean complex, and Odessa; (2) the Persian Gulf, and with it Basra and Baghdad; (3) the region of Suez and with it Aden, their importance greatly increased after the completion of the Suez Canal in 1869; (4) and finally such vital natural routes as the Belgrade-Salonika highway, the Belgrade-Constantinople-Baghdad roads, and the Taurus passes between Asia Minor and Syria.

During the second half of the 19th century still further complications were to enter the Eastern Question. Among Great Powers, Germany emerged, new and strong, active alike by land and sea, so effective that she gradually caused a realignment of the other main forces involved, for in her presence England, France, and Russia eventually had to draw together, and in so doing perforce relaxed the Western powers' traditional resolve to keep Russia from the Straits area at any cost. Also affected was Britain's previous stand against Russian gains in Persia, in central Asia, and in the Persian Gulf as well. A further complication was the emergence, one after the other, of a whole series of resolute, hot-headed Balkan nationalisms. This complication thenceforth has troubled all big power calculations concerning the area, and has meant that big power gains here have frequently had to be disguised as the "protection" of a small nation state which not seldom is ultimately ungrateful to, and uncooperative with, its "protector." It is not for nothing that this area has given diplomacy the verb "to Balkanize." Yet another and extremely important complication in the Eastern Question was the ascent of oil to the position of a vital commodity in world economy, for the Near East proved to have great stores of this mineral, not only at the head of the Persian Gulf and elsewhere in Persia and Mesopotamia, but also in the Arabian Peninsula and in the Caucasus.

During the 19th century, moreover, the Great Powers had come to be in conflict in many other areas of the world as well as in the Near and Middle East. Therefore the course of events in the Moslem world was continually conditioned by the posture of imperialist rivalries in regions far remote.

It is true that the local peoples of the Near and Middle East were now finally aware that they could never, of themselves, defeat the West's new machine of power; during the 19th century they had, therefore, increasingly endeavored to take over certain parts of that machine for their own use. Most of these attempts were of little immediate avail, for these would-be Westernizers had a most imperfect understanding of the new realities which they were striving to grasp. Still, they persevered, for the impact of western Europe was coming to have an increasingly profound effect upon the lives of many of them—an impact on economic, social, and political life as well as on the intellectual. And as Near and Middle Eastern leaders became increasingly self-aware, they were increasingly resolved to become themselves the creators of sovereign nation states and so to end the systems of imperial domination and exploitation-plus-tuition under which they largely lived and to which, in fact, they owed the main share of the progress they had made so far. Nevertheless, in the ultimately most significant field, in their attempts to gain enough power to enable them to realize their goals, they made, and today are making, little real advance. Instead, the West's available power resources and techniques continue to outstrip them at a dizzy pace.

The accumulated tensions of the Eastern Question, and of the Near and Middle East's responses thereto, reached a climax with World War I, important actions of which were fought in the Near East with Near Eastern manpower playing a sizeable role therein. In the interlude between the two world wars, two Near Eastern nation states attained a degree of national sovereignty which could be called "unqualified"—Turkey and Iran—but of these only Turkey assembled enough strength to deter aggressors in World War II. Again, only Turkey was able to make significant headway with her program of compulsory, wholesale, forced-draft westernization-plus-nationalism. Between 1918 and 1939, other nations and would-be nations of the Near and Middle East achieved really no more than qualified sovereignty at best. Important actions of World War II were also fought in the Near East, although in this case no local forces played any important role. Since 1945, the aftermath of war has enabled further areas of the Near and Middle East to gain independence: India and Pakistan, Lebanon and Syria. The status of Palestine has been radically and violently altered. (See ISRAEL.) Other local nation states which had a measure of qualified sovereignty have at least moved closer to true sovereignty. All this has been achieved principally because the Great Powers have, in their weaknesses at home, been obliged largely to forego their imperialist programs abroad; but the prospects of such nation states are not brightened by the consideration that another great power, Soviet Russia, has simultaneously re-emerged in the role of imperialist expansion, although the other newly emergent world power, the United States, is visibly reluctant herself to employ the traditional concepts and techniques of European imperialism.

Above all, with the partial exception of Turkey, none of the nation states of the Near and Middle East has at its disposal adequate power to deter aggression, or good prospect of soon being able to assemble such resources in significant degree. Hence in 1950 it was even truer than

1850, just as in 1850 it was truer than it had been in 1750, that all progress and local achievement in the Near and Middle East were overclouded by the fact that the area is a power vacuum in a world where power ultimately decides most of the mundane destiny of mankind. See also separate articles on the countries of the Middle East.

14. RUSSIAN MESSIANISM AND THE MIDDLE EAST. In its ultimate portentous consequences, Russia's history had been much more deeply influenced by the traditions of the Middle East than the usual interpretation of Russia's "Byzantine heritage" would lead one to think. A total survey of the ideologies and traditions of the ancient Orient in their influence on the course of world history opens a deeper insight into the specific importance of these traditions for Russia's internal history and the history of her foreign relations. Such a systematic survey of the elements that enter into the history of this Oriental area in ancient times, primarily the "negative heritage" bequeathed to it by Greek antiquity, will help us to a better understanding of the Russian problems of today. More light must be shed on the Oriental and Byzantine heritage which takes first rank among the formative factors in Russian history. In so doing we shall find that Russia was (1) the general objective on which the traditions of the Middle East worked, with the result of forming Russian autocracy; (2) the special objective of Byzantinism in the formation of Russian theocracy; (3) the common objective of both traditions in forming the typical Russian messianism; and (4) in consequence of these three developments, it was precisely the Middle East which became the main objective of Russian imperialism.

Autocracy.—The history of Russian autocracy, on the one hand, an extreme manifestation of the Byzantine doctrine of the state: "... the Russians have sought salvation in the political institution that was the bane of the mediaeval Byzantine world. They felt that their one hope for survival lay in a ruthless concentration of political power and worked out for themselves a Russian version of the Byzantine totalitarian state."¹ In this "Russian version," however, we discover a fundamental feature which distinguishes the despotic character of the Russian political and social system in its pre-Christian Oriental and pagan sense from the Christianized, Hellenized form of its Byzantine prototype. This difference is twofold: first, there is in Russian autocracy a special emphasis on the national-

istic exclusiveness of the Russian state, in contrast to Byzantium which, with its genuinely "cosmopolitan" attitude, did not know devotion to a purely "Greek" state. Russian autocracy is the conscious expression of an absolutistic, nationalistic political system; it is thus a reversion from the Byzantine attempt, made under Christian influence, to transcend the native civilization of the *polis* (city-state) as growing out of the Greek *nomos* (law) and to transform it into the cosmocratic order of the Hellenistic *cosmopolis*. (See section *Byzantium and Eastern Christianity*.) The full retrogression from this Byzantine attempt now came to life on Russian soil. Russian autocracy thus marks the defeat of the Byzantine *cosmopolis* and, in its place, the expansion of the city-state of antiquity to fill the wide spaces of the Russian realm. The fact that Russian autocracy has its roots in the traditions of the ancient city-state had such fundamental consequences for the whole development of the political structure of Russia that even today "... On this point there is no real difference between the views of Plato and of Lenin."² On the other hand, the second characteristic feature of Russian autocracy was an element neither of the Byzantine *cosmopolis*, nor of the *polis* of antiquity: It is the notion of the "folk," with this term's connotation of "blood and soil." This element of Russian autocracy, of being consciously rooted in the folkways (*Volkstum*), made it entirely compatible with the kindred traditions of the native Oriental peoples. If we analyze this characteristic trait of orientalism, we find that the main content of the native popular cultures lies in the palpably materialistic, the naturally physical elements—in contrast to both Byzantium and Hellas. This enters as a typically Oriental trait into Russian popular culture with its religious veneration for the soil (*matuschka syra-zemlja*), for sacred "little mother earth." "Hence it follows that the greatest religious temptation for a Russian will be a pantheism of a sensual (*hylzoistic*) kind. Sacred matter rather than spirit is the object of veneration."³ This typically Oriental leaning toward hallowing material things and materializing transcendental values was the deeper source of Russian sectarianism which, in its religious oddities and wide diversities, far surpasses even the sectarianism of Oriental Christianity from which in many respects it directly originates. (See section *Oriental Christianity*.) In the same way, the theological peculiarities of the Russian Sophianists—Vladimir S. Solovyov (Soloviev, 1853–1900), Leo P. Karsavin (1882–), Sergei N. Bulgakov (1891–1944); the blasphemous doctrine of the "God-bearing people" and its exclusively "Russian Christ"—Fyodor Dostoyevsky (1821–1881); the monstrosities of the sexual Eros—"theology"—Vasilii V. Rozanov (1856–1919), Dmitri S. Merezhkovski (1865–1941), even Solovyov—they all have their roots in this "pantheism of a sensual kind." Even the peculiar Russian cult of the sacred icons and its theological justification bears a striking resemblance to the sacred cult of pictures and statues in ancient Egypt. In the end this ideological complex offered the possibility for the Bolsheviks to transform the old Russian theocracy into the neo-Russian technocracy; for all these phenomena are

¹ Crossman, R. H. S., *Plato To-day*, p. 215 (Oxford Univ. Press, New York, 1939).

² Fedotov, G. P., *The Russian Religious Mind*, p. 20 (Harvard Univ. Press, Cambridge, Mass., 1946).

³ Toynbee, Arnold J., *Civilization on Trial*, p. 181 (Oxford Univ. Press, New York, 1948).

in perfect "accord with Russian history and may be explained, all in all, as a fundamental Russification and Orientalization" (Berdyayev).

When in this manner the traditions of the Greek *polis* and the Asiatic heritage of Mongolian despotism coalesced with those of Oriental idolatry of the "folk" and the state and formed a further combination with the social and spiritual collectivism of Byzantium, the peculiar "folkdom" structure of Russian autocracy was produced. The Russian individuals were born and forever confined by destiny to this framework of political despotism and social collectivism. This is the reason why the masses of the Russian people—comparable to the masses in ancient Greece and the Orient, their comrades in this fate—never felt a psychological compulsion to revolt or to organize a systematic social and political opposition in the Western sense of the term. This Russian "folk-body" with its marked Oriental collectivism was forced to exist within a rigid system of political serfdom which carried on almost "naturally" the traditions of both Hellenistic-Byzantine despotism and the Greek slave-state, merging them into the historical novelty—first of the old-Russian czarist autocracy, and then of the neo-Russian technocracy and the "democracy," Leninist-Stalinist "version." "The Orientalism of the state, rebuilt by Diocletian, was paralleled by the orientalization of social life which had fallen to the level of oriental, pagan societies. Slavery was not only one of the basic social institutions but the model type for all social relationships. Everyone was the slave of his superior and the master of his inferior. The ethics of slavery, in the disguise of Christian humility, were accepted and idealized in the Byzantine Church. In reading the Byzantine historians one is appalled by the amount of cruelty and perfidy occurring at every step. . . . Certainly there was cruelty in the Western middle ages too, but in Byzantium one is confronted by a cold passionless cruelty which finds no moral opposition from either the narrating authors or—with rare exceptions—from the contemporary Church. . . . A certain amount of hypocrisy was naturally created by the half-conscious feeling of incompatibility between the pagan structure of society and Christian standards."⁴ If we relate but the generally known facts of Russian history to this description of Byzantine autocracy, as stated by one of the most important among contemporary Russian historians, the parallelism with the so-called "Russian version" (Toynbee) is striking. A similar parallelism appears when we recall the ancient Greek examples of Athens and Sparta and then turn to their "Russian version" of today—Stalin's "democracy." In Athens, ". . . Plato would find a resemblance between his own ideal State and Communist Russia. Both are attempts to make life conform to a strictly rational pattern. . . . No combination of citizens intent on their own economic ends must be allowed to threaten or cajole the government, whether it be a company anxious to increase its profits or a trade union formed to protect the standard of living of the poorer classes. . . . Plato believed the philosopher must become king; Lenin achieved it. Those qualities in Communism which shock us most, its suppression of the opposition, its sacrifice of the individual life to the great plan, its hostility to all rival creeds, are the qualities which Plato would

have most admired."⁵ If we finally add the well-known scheme of Sparta's despotic structure—a minority of citizen leaders who reigned supreme over the majority of laboring *metoeci* (metics) and Perioeci and the pitiful slave army of the helots—we see again an exact parallel to their "Russian version" of today: the Communistic leader hierarchy, the disenfranchised masses, and the pitiful forced labor battalions. In all these parallelisms we find an entirely objective manifestation not only of the Byzantine, but even more of the Oriental heritage of unfailingly autocratic Russia.

Theocracy.—The essence of Russian theocracy also reveals a strongly modified version of the Byzantine pattern. Russian Caesaro-papism always interpreted the relationship between church and state with a strong bias for the domination of all organized religious life by the state, whereby the true character of the church became distorted. It is a fact that in the pre-Muscovite era, beginning with Vladimir's conversion to Christianity (989) up to the institution of the patriarchate of Moscow (1589), the church in Russia enjoyed more liberties and greater independence from the immediate domination by the state than was true under the reign of the Byzantine "symphony" of church and state. This was possible only because the church with its hierarchical organization was not Russian at all but typically Byzantine, and because the Russian bishops (partly native Byzantines) were subordinated directly to the patriarchs of Constantinople and only indirectly to the Russian sovereigns. However, no sooner had the czars of Moscow achieved the independence of the Russian Church from the Byzantine state church, than they began to subject all religious life more and more to the autocratic state authorities, a process which reached its goal under Peter the Great (1721) when the patriarchate was abolished and the church completely nationalized. After Peter the Great, the Russian Church—in full contrast to the Byzantine state church—did not enjoy comparative religious and theological independence; it became exclusively an instrument of state autocracy, the czar ("gossudar") uniting in his person the offices of emperor and patriarch. Thus, Byzantine Caesaro-papism was transformed in Russia into a new kind of Caesarism in which, following the typical Oriental pattern, the czar's person and office became the supreme and exclusive temporal incarnation of divine authority and the sole source of both secular and sacred law. The hierarchical structure of the church imitated that of its model, the church of the ancient *polis*, in which the cult of religion turned into the absolute cult of the state and the priests were state employees. "The Greco-Russian priesthood never was, and never will be, anything but a militia of the Russian State, distinguished from the secular troops of the Empire only by their uniforms" (Custin); see *Bibliography*. This explains also why in Stalin's Russia of today the patriarchate, in spite of its name, was not only able to find a *modus vivendi* with the neo-Russian autocracy, but lent itself willingly as the instrument for the Russianization of all non-"orthodox" religious groups and ecclesiastical institutions in the eastern European area, as far as these states were exposed to the domination by Moscow. We also understand why the modern "orthodox" doctrine

⁴ Fedotov, G. P., *The Russian Religious Mind*, pp. 36-37 (Harvard Univ. Press, Cambridge, Mass., 1946).

⁵ Crossman, R. H. S., *Plato To-day*, pp. 213-214 (Oxford Univ. Press, New York, 1939).

of the state (Kartashov) could meet with Stalin's full assent when it declared that the Byzantine state-church-symphony should now be replaced by a system which goes back to the "pre-Constantinian" pattern of the state, with the implication that it would be based on the Oriental and the ancient Greek state autocracy.

This typically Russian model of an absolutistic, rationalistic theocracy is based as much on the full identification of the intrinsic natural values of the Russian soil (*russskaja zemlja*) and people with the spiritual values of the Russian religion, as it is based on the identification of the church life with the political-social. Thus the naturalistic, materialistic character of this "theocracy" in which "sacred matter rather than spirit is the object of veneration" was the necessary precondition for the success of the experiment of Russian Bolshevism. In Bolshevism the old materialistic and sensualistic theocracy found its ultimate manifestation in entirely secularized form, in the neo-Russian technocracy. In this process of transformation nothing of the typically Russian peculiarities, embodied in the old theocratic order, needed to be scrapped. The basic difference is only that the naturalistic mysticism—of the sacred little mother earth" (*matuschka zemlja*), of the Russian Christ" and the folk-bound "integral body of Christ"—was replaced as a formative principle by the rationalistic mysticism which surrounds the material resources of Russia, the electrification, the communal-technical collective and the machine. In this virtually "organic" transformation of the mystical naturalism of Russian theocracy into the rationalistic materialism of neo-Russian technocracy lies the creative originality of the Communist experiment—as yet much too little recognized and evaluated—which makes it a novel feature in world history. Lenin, who had a truly mystical veneration for electricity and the machine, deserves recognition as a true Russian for having grasped these possibilities at an early stage, and for having the force of a genuine autocrat and technocrat to utilize all political and organizational potentialities by substituting the new technocrat values of electricity and the machine for the old values and forms of theocracy. How very factual is this connection between old Russian theocracy and neo-Russian technocracy can be noticed even in the outward forms of this transformation when, with as much passion as success, the "God of electricity" was raised as substitute for the old "Russian God"; the totalitarian human "collective of the machine" as substitute for the old Russian totalitarian "body of Christ"; and the "devotion to the machine" for the "imitation of the Russian Christ." Meanwhile, following quite naturally the dialectics inherent in this process of transformation, the dominant formative principles in all of Russian history, "Pan-Russianism" and "nothing-but Russianism," have largely prevailed over the extreme messianic and apocalyptic features, including the extremes of technocratic atheism and hatred of religion. Instead, the autocratic structure of Russian life has once more been consolidated within the old traditions with the one difference: that the despotism of the former czarist theocrat, sanctioned by religious messianism, has been replaced by the dictatorship of the neo-Russian technocrats, Lenin and Stalin, sanctioned by Communist messianism.

Structure of Messianism.—Russian messianism, historically, is a mixture of the Oriental

idolatry of "folkdom," the political arrogance of the Greeks, and the exclusivity of Byzantine orthodoxy, to form a religious-political system of boundless fanaticism and lust for power. The God-chosen people ("folk") of the Russians is the sole incarnation of the true Christian community and its way of life, and of Christian charity. Consequently, whatever is alien to the Russian "folk" as the only begotten exponent of "Russian love" (Dostoyevsky) is necessarily of inferior rank—a close parallel to the exclusiveness of the Hellenes of antiquity as against the barbarians. After the fall of Byzantium and the heretical behavior of the Roman Church, the Russian Church becomes the only God-ordained representative of the genuine doctrine of Christianity and of the truth of orthodoxy. Moreover, the only way for the other Christian churches to atone for their apostasy and find true salvation is to return to the bosom of "Orthodoxy" (Boulgakov). The Russian Empire, finally, being the historical manifestation of the "chosen people's" will and the only visible exponent of the church's spiritual mission to embrace all mankind, is the sole institution charged with leading all the world toward the order and peace willed by God, and capable of so doing. It follows that the capital of this empire must assume all traditions, all leadership ever exercised in world history by any other metropolis, just as exclusively as this empire combines in itself the succession of all previous empires: Holy Moscow becomes the hub of the world! And since in the messianism of Holy Russia all the traditions of the *orbis christianus* centering on Rome are concentrated, it is only natural that now Moscow must unite all the traditions, first of the original papal Rome, then of the Byzantine New Rome now in the hands of the "infidels," in order to give to humanity in a Third Rome the living law of a historical and spiritual world community. In other words: all nations must be Russianized, all churches must become orthodox, the entire world must become Russian (Dostoyevsky).

These are the principal ideas and aspirations of Russian messianism, as heralded long ago in the early Russian *Saga of Prince Vladimir* by the Metropolitan Spiridon. According to this saga, Russian history dates back to the age of Noah and centers around one aim: to endow Rurik (Ryurik), the founder of the Russian Empire, with the legitimacy of a direct line of succession, beginning from the world realms of Egypt, Alexander the Great, the Indian crown, Rome, and Byzantium. Ever since this primitive work, the historical, political, and theological literature of Russia, in innumerable variations and with growing seriousness, has filled these aspirations with a concrete content. As early as the 16th century, these ideas were given a clear direction within state and church policies in the thesis of the *Third Rome*, as formulated by Philotheos of Pskov. Later, laid down in the 19th century in the ideologies of the Slavophiles, these aspirations find their systematic expression and intensification in history, philosophy, and theology, most completely in the writings of Aleksei Khomyakov (1804-1860), Ivan V. Kireyevsky (1806-1856), and the Aksakov brothers, Konstantin (1817-1861) and Ivan (1823-1886). This messianism reaches its ultimate climax in Fyodor Dostoyevsky's Pan-Russianism (*An Author's Diary*, 1861, 1873 to 1881), in Nikolai Danilevsky's Pan-Slavism (*Russia and Europe*, 1869), in Kon-

stantin Leontyev's Pan-Byzantinism (*Byzantinism and Slavism*, 1874; *The East, Russia and Czarism*, 1885). This is the epoch in which in the political sphere this messianism is definitely transformed into Russian imperialism, through the writings of men like Sergei S. Uvarov (*Orthodoxy—Autocracy—Nationalism*, 1843), Konstantin P. Pobiedonostzev (1827–1907), and the journalistic work under the leadership of Mikhail N. Katkov (1818–1887). During this entire trend, one solitary Russian made an attempt to correct this Pan-Russian form of messianism. This was Vladimir S. Solovyov whose ideological essay *La Russie et l'Eglise Universelle* (*Russia and the Universal Church*) could not be published in Russia, but was printed in Paris (1889). He tried to establish a very problematical connection between the imperialism of the czars and the universalism of papacy to form a "free theocracy" as a new unit for world domination.

We can without difficulty recognize the astonishing parallelism, identity even, between the autocratic attitude, the orthodox intransigence, and the Pan-Russian missionary drive and urge for world domination of the theocratic messianism of czarist Russia on the one hand, and the technocratic messianism of Communist Russia on the other. The difference lies only in the ideological motivation and formulation of the aims; in practical result it comes largely to the same. On principle, technocratic messianism has replaced the religious motive by the social motivation of the Marxist doctrine of salvation; instead of the world domination by ecclesiastical orthodoxy and theocratic imperialism, it proclaims the world domination by Marxist orthodoxy and technocratic imperialism. We can therefore understand and evaluate the entire history and organization of the Communist aspirations for world domination under the autocratic leadership of the Third International of Moscow only if we place the technocratic messianism of Red Moscow into its proper context in the genuinely Russian historical and ideological perspectives. For, "they managed to get rid of the Czar, but not of Czarism" (Masaryk). "Under the Hammer and Sickle, as under the Cross, Russia is still 'Holy Russia' and Moscow still 'The Third Rome'." ⁶

Imperialism.—In Russian imperialism all the great traditions and ideologies of Russia have worked together to form an instrument of concerted political and military action versus the non-Russian world. Russianism thus transfers the country's own political messianism as Pan-Russianism into the sphere of world affairs, and at the same time it transfers the material struggle for Russia's own economic interests into the struggles among diverse economic interests on the world scene. In this narrow interlocking of ideological and economic interests lies the basic difference between Russian imperialism and its Western counterpart, for the exponents of Western imperialism had and have mostly material interests at heart. Ever since the days of the Congress of Vienna (1815) down to the latest negotiations among Western powers under American leadership, this cleavage was the main source of the deep-rooted difficulties which have over and over again beset the international political relations between the West and Russia. In czarist imperialism, every apparently concrete political objective in the international sphere had nevertheless

its background in typically Russian ideologies. Equally today Soviet Russia's apparently concrete political set of problems in world affairs always has an added ideological element, that of technocratic messianism and imperialism. Any judgment on Russian international policies that would be based on purely rational motives of practical politics would be bound to err, in failing to take into account these historical perspectives. As a matter of fact, it is impossible to "understand" the Russians unless one has deeply probed into their past and has thereby learned to distinguish clearly their aims as formulated in their practical policies of the day from the overriding momentum of their ideological imperialist aspirations. The moment we take the wider view, Russian imperialism will necessarily emerge as that great threat to the world which no one has seen more clearly than two great Russians when, in laying down their judgment, they temporarily broke loose from the ideological traditions of their own Russianism. One of the Vladimir Solovyov, in his Western period, ably characterized the dangers threatening from Russian imperialism thus: "The Russian Empire, isolated in its totalitarianism, is nothing but a threat to Christianity, a danger of struggles and wars without end." (*L'Idée Russe*, Paris 1888.) And similarly Lenin, in his Western period, passed a judgment of condemnation on Russian imperialism which has once more in our day become very much up-to-date: "Being Great Russians, we are swelled with a feeling of national pride, and this is precisely why we have such an intense hatred of our slave past in which the aristocratic landlord led the mushiks into wars to strangle the liberties of Hungary, Poland, Persia and China. And it is precisely for this reason that we also hate our slave present in which that same landlord, aided and abetted by the capitalist, leads us into a war to strangle Poland and the Ukraine and to wipe out the democratic movement in Persia and China" (*Sotsial-Democrat*, No. 35, Bern, Dec. 12, 1914).

Because of the Oriental origins of its ideological traditions, Russian imperialism has always regarded the Middle East as the main target for its aims and actions in power politics. Even the problems of the Far East and the European aspect of her Pan-Slavistic Balkan policies were always secondary to the central theme, Russia's Middle East policies. Here Byzantium and Turkey were the permanent chief objectives of political and military pursuits. "What we want is the good of Slavdom and the entrance to the Black Sea; no Port Arthur, no Shan-hai-kwan, no Pei-ho can take the place of the Bosphorus" (*Novoye vremya* [New Time], April 1901). Likewise, all ideological aspirations have for their pivot the Russian domination of Constantinople and the entire heritage of Byzantium. They found their strongest, undisguisedly messianistic expression in Dostoyevsky's political writings (*An Author's Diary*) and in the pathological fanaticism of Leontyev. Even in the grand game of imperialism which Russia used to play steadily in her international alliances and treaties, the Middle East problem with its centers in Turkey and Persia forever occupied her main interest. How very deeply the preponderance of the Middle East problem is rooted in the traditions and aspirations of Russia was proved most impressively by Stalin's neo-Russian imperialism when in his negotiations with Hitler in 1940 he laid down a "Russian solution" for the Persian and Turkish

⁶ Toynbee, Arnold, *Civilization on Trial*, p. 183 (Oxford Univ. Press, New York, 1948).

questions as *conditio sine qua non* for an open mutual military alliance, otherwise declaring war between Soviet Russia and Nazi Germany to be unavoidable.

A short survey of Russia's wars of aggression waged in central Asia and against Byzantium-Turkey shows more clearly than any long historical treatise that the Eastern Question (q.v.), as the crucial problem of Russia's destiny, was always in the forefront of Russian foreign policies and drive for expansion. We now understand why Stalin, though well aware of the perils of his position, could not avoid tying up Russia's entire future, win or lose, with the Eastern Question. Of her own free will, Russia waged more than 19 wars of aggression in the Middle East. In the distant historic past, the period up to the domination by the Mongols, she carried on four rapacious wars against Byzantium, only to be four times ignominiously repulsed: in the years 860 (Rurik), 911 (Oleg), 941 (Igor), 1043 (Yaroslav). It seems a paradox of world history that Russia first came into contact with Byzantine Christianity only through these aggressions, to which she thus owes her Christianization and her Byzantine traditions. No sooner had the Russians of Kiev rid themselves of their Mongol masters—with the conquest of Kazan, 1552—than the great era of Russian aggressions began. In 1556 Russia conquered Astrakhan and thereby won access to the Caspian Sea. In 1696 she conquered Azov, establishing herself firmly on the Black Sea. After that, Peter the Great, followed by Catherine II, set out on the warlike "Road to Byzantium," but although important minor conquests were made, the coveted goal of Constantinople forever eluded them. This period of eight fruitless aggressive wars against Turkey (1710–1711; 1736–1739; 1768–1774; 1787–1792; 1806–1812; 1827–1829; 1853–1856; 1877–1878) and seven aggressions against Persia and the central Asiatic borderlands has permanently branded czarist Russia with the sorry reputation of being an unequaled international peace-breaker. With questionable pride the Leninist historian Mikhail N. Pokrovski could eventually characterize the results of Russian imperialism with these words: "We Russians—and this I, a pure-blooded Great Russian, must admit—have in the past been the greatest robbers imaginable." (*Trudy pervoi vsesoyuznoi konferentsii istorikov-Marksistov*, that is, *Report on Conference of Marxist Historians*, Moscow, 1930.)

We need only follow the history of the developing Soviet-Russian policies and actions from the outbreak of World War II against the Middle East, primarily aimed at Persia and Turkey. We shall then see that in this respect also Communist Russia endeavors to follow faithfully in the footsteps of czarist imperialism. The future and the destiny of the Middle East essentially depend on whether Soviet Russia at last can reach the very goal that eluded czarist Russia, a prize which Stalin himself, in his greatly conceived gamble with Hitler for the mastery of the world, was not allowed to grasp: the "Russian solution" of the Persian and Turkish questions. Also in this decision the champions that face each other are the United States as exponent of the Western tradition and guarantor of the liberties of the nations of the Middle East, and Soviet Russia as the exponent of neo-Russian imperialism and Communist technocracy. See also section 18 of this article.

EDGAR ALEXANDER.

15. NATIONALISM. In the Middle East, as in all countries outside the North Atlantic region, modern nationalism has been a product of contact with the West and with modern Western civilization. There, as everywhere, its coming presented to the traditional societies of the prenationalist age a challenge to reform and adjust the whole structure of their group life, their cultural aspirations and their individual outlooks. Modern nationalism became a force in the Middle East only in the 20th century. But in the preceding one hundred years, the Napoleonic armies and, many decades later, British administrative practice and American education had sown the first seeds, which were slowly to take root among a few individuals of the ruling classes and to set them thinking about the need to transform the ancient civilizations of the Mediterranean Orient into modern nations.

Beginnings of Nationalism.—At the beginning of the 19th century, Middle Eastern society was organized on a traditional religious basis. The religion which was by far the most important numerically and which at the same time was the religion of the ruling class was Islam. By its whole teaching and its outlook Islam, though Arab in its origin, was strictly international, or rather supranational, representing a brotherhood of the faithful irrespective of descent or race, language, or native land. This community of civilization and way of life maintained itself until the 20th century, more intense in its feeling of unity and more unified in its outlook than medieval Christianity had been. The only differentiation was according to religious sects within Islam, and in that respect it might be said that the Shi'ites represented, on the whole, a Persian national tradition, while the Wahhabis, a sect founded in the middle of the 18th century in the Nejd in the Arabian Desert, tried to revive the original features of desert-Arab Islam. The conquests of the Wahhabis, who were animated by a fanatical crusading spirit (Karbala, sacred city

of the Shi'ites, taken in 1801; Mecca, sacred city of the Sunnites, 1802), and the short reign of these religious warriors over the whole of central Arabia, from which they were dislodged only in 1818 by Egyptian troops, can be regarded as the first manifestation of a new Arab nationalism, though still in a strictly traditional and medieval garb. The same ruling house, the family of Sheikh Mohammed ibn-Saud (d. 1765) of the Nejd, which led the Wahhabi expansion in the early 19th century, was to head the second, and this time definitely nationalist, ascent of Wahhabi power in the 1920's.

The Egyptian Army which had broken the Wahhabi power in 1818 was the first fruit of the penetration of Western concepts of the modern nation state into the Middle East. The French occupation of Egypt (1798) laid the foundations not only for exploration of the history and culture of ancient Egypt (creating thereby the historical background for future Egyptian claims to nationhood and glory), but also for administrative, economic, and military reforms, which were started by Mehemet (Mohammed) Ali (1769-1849), an Albanian soldier of fortune, who in 1805 became Turkish governor of Egypt. With the help of French instructors he built up the rudiments of a modern army and navy, and planned to make Egypt the center of an Islamic renaissance and of a Europeanization of Islamic society.

It was a period when the influences of the French Revolution and of the Napoleonic wars aroused nationalist aspirations throughout the Near East, not only in the Serbs and Greeks but even in Turkey, where Selim III (r. 1789-1807) planned in 1793 the complete reorganization of the military system, and Mahmud II (r. 1808-1839) abolished the Janizaries (1826), while in the year of his death his youthful successor, Abdul Medjid (r. 1839-1861), issued the first reform decree. This decree, the Hatti-sherif of Gulhané, was the first wedge in transforming the obsolete medieval theocracy into a modern nation state, and in introducing the beginnings of modern economy and education. However, these early reforms in Egypt and Turkey did not strike roots. There was not yet an educated class filled with a sense of national responsibility. This began to grow only in the last decades of the 19th century, when closer contact with Europe had been established, when American schools had been founded (Robert College in Constantinople, opened 1863, and the Syrian Protestant College, later renamed the American University, at Beirut, 1866), and especially when the British had set the example of a modern administration in Egypt, where under these conditions security of law and capitalist enterprise helped develop the beginnings of a native middle class.

Growth of National Consciousness.—As the result of the fact that European Turkey was most closely exposed to Western influences, and that its officers and administrators had to acquire knowledge of European languages and science, a literary and political awakening in the European sense could first be noticed among Turkish intellectuals in the 1860's. Ibrahim Shinassi founded in 1860 the first unofficial Turkish newspaper, *Terjumanı Ahval* (*The Interpreter of the Situation*) which changed its name to *Tasvir-i Efkar* (*Tablet of Opinion*) the next year. In 1862, Namik Kemal Bey, the great agitator and poet, joined the paper. These years marked the

beginning of the steady growth, in spite of governmental repression, of nationalist agitation among the intellectuals. Many of them lived abroad and there published papers, such as *Hürriyet* (*Freedom*) in London (1864), which were smuggled into Turkey, and organized the Young Turk political movement. Western prose and poetry were translated into Turkish, and there was created a literary language which could express modern secular emotions and aspirations. It was, however, only in 1908 that this reformist nationalism entered the political stage with the successful Young Turk military revolt. Meanwhile, the Young Turks had changed their name to Ottoman Committee of Union and Progress, and their rising nationalism encountered the difficulty presented by the rise of other and opposed nationalisms in the formerly supranational Ottoman Empire.

Among these new nationalisms which worked for the disintegration of the Ottoman Empire were not only those of the Christian peoples (Armenians, Greeks, Serbs, and Bulgarians), among whom religious organization had often acted as a national church, but for the first time national movements among Mohammedan peoples, above all the Arabs, and to a lesser degree the Albanians and Kurds. With them, as in Egypt and Persia, nationalism became vocal in the first decade of the 20th century, though in Egypt proper the nationalist slogan "Egypt for the Egyptians" was first heard as far back as 1878. But this early movement, led by one of the few officers of Egyptian origin in the Egyptian Army, Arabi Pasha, collapsed quickly in 1882 and provided the occasion for British occupation of the country.

Early 20th Century Nationalism.—Only at the beginning of the 20th century did nationalism appear as a force in Egyptian public life, at the same time that it did in Turkey, in Iran, and among the Arabs. In all these cases, as throughout Asia and Africa, these new nationalist aspirations drew encouragement from the Japanese victory over Russia and from the example of the Russian revolution of 1905. Until then nationalism had been a purely intellectual and cultural movement, confined to the very small group of westernized intellectuals. The few attempts at what might be called a political awakening were hindered by the despotism of Abdul Hamid II, and by the apathy of the masses. At the beginning of the 20th century Najib Azuri founded in Paris a *Ligue de la Patrie Arabe* and began the publication of a periodical proclaiming Arab independence. Only in Egypt, under British influence, did there exist a possibility for the formation of a free public opinion, of political agitation and education, while at the same time the security of law, established by the British, favored the growth of capitalism and thereby of a native middle class. Mustafa Kamel (1874-1908), who had studied in France and had tried to mobilize French public opinion against England's predominance in Egypt, started in 1898 a movement for national schools in Egypt, and founded in 1900 the *Hizb al-Watan* (the National Party) which wished to teach the Egyptians self-emancipation, and demanded the union of Egypt and the Sudan under purely Egyptian control.

Mustafa Kamel died the same year that the Ottoman Committee of Union and Progress (the Young Turks), frightened by the possible consequence for Turkey of the British-Russian agree-

ment of 1907, compelled the sultan to reintroduce the constitution which had been in force for only a short time 30 years before. The following year (1909) Abdul Hamid was deposed, and the Young Turks assumed full control of Turkey, with the aim of transforming it into a modern centralized nationalist state. Exalting the principle of nationalism as the foundation of the multiracial empire, they were forced to encounter the hostility of the non-Turkish races within that empire, and in a long period of wars, lasting from 1910 to 1922, the Young Turk regime foundered, and the Ottoman Empire was dissolved into its national components. To support the Turkish national policy, the Young Turks under the leadership of Enver Pasha (1881?-1922) developed the theory of Pan-Turanism—a union of all the Turki-speaking peoples, the bulk of whom lived within the confines of the Russian Empire. Pan-Turanism was, in that way, not only to add great numerical strength to the Ottoman Turks, a minority within the Ottoman Empire, but also to counteract Pan-Slavism and the Russian designs against Turkey. At the same time, the Turks who had for centuries regarded themselves exclusively as members of the Islamic civilization, founded largely on Arabic and Persian cultural traditions, rediscovered their pre-Islamic racial and linguistic past.

Of a different nature than Pan-Turanism was the Pan-Arab movement. Its first beginnings fall also in the period after 1908; in fact, it was a countermovement to the strong emphasis on Turkish and Turanian nationalism, destroying the unity of the Islamic world. Pan-Arabism wished to unite definitely the Arab provinces of the Ottoman Empire, the Fertile Crescent of Mesopotamia and Syria, which stretched from the Persian Gulf to the Suez Canal, and the nomad inhabitants of the Arab desert, of which only the fringes, especially Hejaz with the holy cities of Mecca and Medina, were under Ottoman control. But many Pan-Arabs went further and dreamed of the union of all Arabic-speaking countries, which would include not only Egypt but the whole of North Africa. The center of these Pan-Arab aspirations was partly in Syria, where it was led by intellectuals who worked for the decentralization of the Ottoman Empire and Arab autonomy within it; partly in Mecca, where Husein ibn-Ali (1856-1931), whose family was descended from Mohammed, was appointed in 1908 sherif of Mecca, and thereby the custodian of the holy places of Islam.

The same years after 1908, which saw the beginning of political nationalism among the Turks and Arabs, witnessed a similar development in Persia. There, the Islamic reform agitation of Jamal al-Din al-Afghani (1838-1897) and the westernizing tendencies of Malcolm Khan, a Persian diplomat of Armenian descent, had laid the foundations in the later part of the 19th century for an awakening of the small Persian intelligentsia to the need of national reform. Under the influences of the Russian Revolution, at a time when Russia was the decisive imperialist power in Teheran, a Persian revolutionary movement broke out at the end of 1905 and forced the introduction of a constitution, which also allowed for the growth of a Persian press. Russian intervention in June 1908 tried to put a stop to this constitutional development, but under the inspiration of the Turkish Revolution, the nationalists reasserted themselves in 1909, to be

defeated again at the beginning of 1912 by Russian intervention.

Nationalism After World War I.—This was the situation in the Middle East at the outbreak of World War I. Its consequences were felt even more strongly in Asia than in Europe. Throughout the Middle and Far East, from Egypt to China, the events and slogans of World War I aroused not only the intelligentsia, but for the first time began to stir the native masses. Under national leaders who now arose in all the Middle Eastern countries, the peasant masses awakened from their age-old lethargy and submissiveness. This was the result of the penetration of Western ideas into the East. Some of it was communicated by formal education, especially in India under British leadership. Most of it, however, was "in the air," an expression of the German term *Zeitgeist*. The ideas and movements which had activated Europe in the 19th century now spread to the Middle East and Asia, where, however, the intellectual and social conditions did not exist, nor the moral traditions, on which these movements had been founded in Europe. On the other hand, the Middle East developed a number of capable leading personalities. Their various social positions reflect the stage of development in the different countries. In Turkey, the leadership fell to a member of the officer class, from which had come also the leaders of the Young Turk movement: Mustafa Kemal, later called Kemal Atatürk (1881-1938). In the Arab lands capable leaders came from ruling families in nomadic Arabia: Abdul-Aziz ibn-Abd-al-Rahman al-Faisal ibn-Saud, generally called Ibn-Saud (1881?-), originally the Wahabi sultan of Nejd and in 1932 king of Saudi Arabia; Faisal I (1885-1933), son of Husein ibn-Ali, and briefly king of Syria and later of Iraq. In Egypt, leadership fell to the new middle class, which during the British occupation had risen from peasant ranks: Saad Zaghlul Pasha (1860?-1927), who was succeeded by Mustafa el-Nahas Pasha (1876-). In Persia, which after World War I changed its name officially to Iran, thus re-emphasizing the national connection with ancient glories, the leadership was exercised by Reza Khan Pahlavi (1877-1944), a soldier who made himself shah and ruled from 1925 to 1941. Each of these leaders tried to reform the government of his country on the basis of nationalism and westernization, but each one proceeded in a different way, according to the social development and geographic situation of his country.

Leadership in this general trend was taken by Turkey. As a result of World War I, the Ottoman Empire was dissolved. From the ethnical center of the Turkish population, from the highlands of Anatolia, came the victorious opposition of the Turks under Mustafa Kemal against the victors of World War I. His successes against the Greek invaders of Anatolia in 1922 made it possible for Turkey to establish her complete independence within her ethnic frontiers by the Peace Treaty of Lausanne (1923). Only in eastern Anatolia did the Kurds form a national minority and resist in several uprisings their forced integration into Turkish nationality. Mustafa Kemal's reforms transformed Turkey from a medieval Islamic nonnational state into a modern secular nation state. Ziya Gökalp (1875-1924) may be regarded as the intellectual father of the new nationalism, with its reinterpretation

and reappreciation of the Turkish past and its application of Western ways to the Turkish future. Under the impact of the new nationalism, Islam was deposed as the religion of the state; modern law was introduced instead of Islamic law; special attention was paid to the indoctrination of the people with the new ideology and to the spreading of literacy; the vernacular was divested of its Arabic and Persian words and influences; Latin script was introduced instead of the Arabic; and an all-out effort was made to establish the new Turkish civilization on the twofold foundation of ancient Turkish traditions and of modern Western influences, thus weakening the impact of the Islamic civilization which had shaped Turkish life and destiny for the last six centuries.

Reza Shah Pahlavi tried to emulate Mustafa Kemal's nationalist reforms, but the conditions in Iran were much less favorable than in Turkey. Iran possessed neither the long cultural contact with the West nor a governing class with administrative abilities; on the other hand, the hold of religion and the density of native cultural traditions was greater there than in its western neighbor. Yet there, as in all other Middle Eastern lands, the 20th century could be called the age of the making of a nation, the conscious reawakening of its past as a guarantee of a culturally and politically mighty future. As in Turkey, this new nationalism was accompanied by efforts toward a strict centralization of government, the emancipation of women, and the modernization of economic life. The new nationalism also forced the tendency to rely for the much-desired industrialization of the country, as far as possible, upon the country's own resources, and to emphasize strongly rights and claims springing from the jealously guarded full sovereignty of the nation.

More complex was the development of nationalism in the Arab-speaking countries. Various factors fought against an early unification of all these lands into one Arab national state, as the nationalists demanded. There were important religious minorities, such as the Shi'ites in Iraq, the Christian Maronites in Lebanon, and the Copts in Egypt, and there was the opposition of the fanatical Wahhabis to the other Mohammedans. There were the great cultural and social differences between the settled population of the trading cities and sown land and the nomads of the desert. There was the strength of local traditions and vested interests. Even stronger as a retarding factor was the hesitation of the Egyptians between allegiance to a "Pharaonic" civilization of the Nile Valley and the common tie of culture and language with the Arab lands; also the rivalry of the various dynasties for leadership, especially those of Husein ibn-Ali of Mecca, of Ibn-Saud, and of Egypt (King Fuad I, 1922-1936, and Faruk I, 1936-). The situation of nationalism in the Arab-speaking countries may be compared with that in Italy in the first half of the 19th century, when similar circumstances delayed the unification of the Italian nation propagated by nationalist intellectuals.

During World War I, Arab intellectuals in Syria put forward the claim to Arab independence from Turkey, and Husein ibn-Ali entered into an agreement with the British to revolt against the Turks, while the British promised to support Arab independence under Husein. His son Faisal led the famous revolt in the desert

which was inspired by Col. T. E. Lawrence. Husein was recognized as king of Hejaz (1916), but he was unable to carry his claims to other Arab lands. Faisal, after an unsuccessful attempt to establish himself in Damascus as king of Syria, which would include all the lands from the Taurus Mountains to the Sinai Peninsula, became with British help king of Iraq in 1921. There he was successful in gaining full independence for his country and having the British mandate over Iraq terminated in 1932. The Syrians were less successful. Their country was put under a French mandate, and was divided into a predominantly Christian Lebanese republic in the coastal district, and a predominantly Mohammedan hinterland which became the center of nationalist agitation. The independence of these two states (Syria and Lebanon) was achieved only after 1941. Meanwhile, Faisal's older brother, Abdullah ibn-Husein, who had claimed the Syrian throne after Faisal's defeat there, had become emir of Transjordan under British mandate. With the proclamation of the independence of Transjordan in 1946, Abdullah assumed the title of king and became the senior member of the family left by Husein ibn-Ali, the Hashemite family. In 1949 the name Transjordan was changed officially to the Hashemite Kingdom of the Jordan. On July 20, 1951, Abdullah was assassinated by an Arab fanatic.

Husein ibn-Ali himself lost his kingdom in 1925 to Ibn-Saud, who at the head of his Wahhabis created (1932) a unified Arabian Peninsula from the Persian Gulf to the Red Sea and assumed the title of king of Saudi Arabia. For the first time in over 1,000 years the desert obeyed a unified rule which assured and protected peace and commerce. Ibn-Saud set out to settle the nomadic population and to modernize the primeval living conditions; necessarily this was a slow and arduous task, in which he was helped by royalties from the American oil companies.

Of all the Arab-speaking lands, Egypt is not only the most populous but also stands out for its wealth and for the relatively progressive quality of its administration, built up under the British occupation. There the nationalist movement strove to end British occupation and to establish the full independence of Egypt; to bring the Egyptian colony of Sudan (conquered by the Egyptians in 1820 but lost in the 1880's) under full Egyptian control and end the Anglo-Egyptian condominium established in 1899 after the reconquest of the country by Anglo-Egyptian forces; and to transform Egypt into a parliamentary democracy with a modern social and educational policy. At the end of World War I, a nationalist delegation (in Arabic, *Wafd*) under the leadership of Saad Zaghlul Pasha demanded permission to put before the peace conference Egypt's claims to full national independence. When this attempt was frustrated, Zaghlul became the leader of the Wafd Party, which wrung from the British ever larger concessions. Egypt was declared independent by Britain in 1922 and received a parliamentary constitution. The nationalist struggle in Egypt was in no way directed against only Britain. The court was in bitter opposition to the Wafd and to its democratic demands. The Anglo-Egyptian Treaty of 1936 removed the last restrictions from Egyptian independence, and the Conference of Montreux in 1937 put an end to the system of capitulations and privileges of Americans and Europeans.

The conflicting tendencies among the Arab countries were at least temporarily bridged by their common resistance to Zionism and to the transformation of Palestine with its originally large Arab majority into a Jewish national state. To that end, the Arab states formed an Arab League (q.v.), but its diplomatic and military measures did not avail against the formation of the state of Israel (q.v.), thereby creating the vast problem of Arab expelled persons and refugees from Palestine. This ineffectiveness of the Arab League reveals the present weakness of Arab nationalism and the need for further reforms and educational measures to restore the Arabs to what their nationalists think is their rightful place in history and in the Middle East. See also articles on the separate countries of the Middle East.

Professor of History, The City College of New York.

16. SOCIAL AND ECONOMIC PROBLEMS.

The social and economic problems of the Near and Middle East stem mainly from their social and economic system which is still generally in a semifeudal stage of development. In agriculture, large landholdings are the rule, and the peasants are mostly sharecroppers who live on a low level of bare subsistence. In industry, the old handicrafts are on the decline and modern mechanized manufacturing is slowly developing but is still largely carried on by small-scale enterprises. Trade with other countries is also on a small scale and per capita foreign trade is very low. Exports consist mainly of food products and raw materials and imports are mainly manufactured goods. Traditionally, trade has been carried on mostly with Europe but in the mid-20th century trade with the United States grew to a leading position. Since World War I oil production has developed rapidly under concessions granted to foreign corporations in which American and British capital predominates. Oil royalties have become one of the most important resources for the budgets of such Middle Eastern countries as Iran, Iraq, Saudi Arabia, and Kuwait.

Most of the countries of the Near and Middle East have but recently emerged from colonial status into the responsibilities of political independence. In all of them, the practice of democracy is still in its early stages and leaves much to be desired. Government administration is generally inefficient, and corruption in administrative and political affairs is prevalent.

The standard of living of the people of the Near and Middle East is generally very low. A small minority of rich landowners and businessmen, however, are very wealthy and live in luxury and abundance. The laboring masses of town and country are very poor and ignorant, and lead a life of continuous struggle for a bare subsistence. In between the wealthy minority at the top and the poverty-stricken majority, there lies a small but weak middle class consisting of salaried

business employees and technicians, government officials of the lower grades, and members of the liberal professions. This middle class does not fill the wide gap in the social structure and has very little political power. However, it produces the intellectual and progressive elements in the population which are gradually exerting more influence on social and political development.

The basic problems of the countries of the Near and Middle East derive from their backward social and economic structure. Although some of these countries have made important progress toward a more productive industrial system, the social structure of most of them is still largely semifeudal in character. This is manifested in the system of land tenure which is the basis of their agricultural organization but which affects directly or indirectly all fields of social and economic life. No definition of this semifeudal economy can be attempted here, but a description of its main features is given below in the discussion of agriculture which constitutes the main productive activity on which almost two thirds of the population in these countries depend for their living.

As a result of this backward state of economic organization, productivity is low and per capita national income is small. In agriculture, the system of land tenure does not allow production to increase because of the lack of incentive for greater efficiency and for capital investment. The peasants are mostly share-tenants cultivating the lands of absentee landlords. The share-tenant has no security of tenure on the same plot of land. He is not certain of keeping the land and receiving the fruits of any improvements he might be able to make by greater exertions or by investment of his savings. But even if he is allowed to retain the same plot of land, there is little incentive for him to increase production since he does not get the full reward of his efforts inasmuch as the landlord would receive his share of any increase in production. In any case, his share of the crop is so small that he is unable to save and invest in improving the land. The peasant therefore has neither the ability nor the incentive to increase production from the land.

Consequently, methods of cultivation are generally primitive, and in most areas agricultural implements have not been improved for centuries. There is little agricultural machinery in use and scientific agriculture is almost unknown. In general, technology is at an extremely low level and far behind the advanced technology of the industrialized nations. On the other hand, there is small hope that the landlords will initiate progressive development in agriculture. The large semifeudal landowners are satisfied with their share of the product which yields them considerable income without effort and enables them to live an urban life of idleness and luxury. Traditionally, these semifeudal landlords are lazy and self-satisfied, as well as reactionary in their social and political outlook. They are the proponents of the established social order and resist any changes which threaten their position in society. They engage in politics with the purpose of maintaining their position of wealth and social domination.

The dependence of the peasant on his landlord is complete, and in his narrow and limited vision seems irrevocable. He rarely has an opportunity to work and make a living other than to remain

on the land and be subservient to his master. He is frequently indebted to the latter, or to the grain merchant who closely cooperates with him. But, he is not only dependent on the master economically and financially but also socially and politically. If any dispute arises among the peasants, they have resort to their feudal lord to have it settled. In time of trouble or hardship, they go to him for advice and help. Whenever any problem arises which requires intervention with the government administration or the courts, it can be settled only with the landlord's help or through his influence. During elections, the peasants vote for their landlord or for candidates supported by him. They dare not vote against him since the secrecy of the ballot is not assured in practice, although it may be established in law. The power of some landlords is such that they could defy the government and even instigate a revolt which might be difficult to quell. The power and domination of the semifudal landowners in some of the countries of the Near and Middle East would seem extremely difficult to overthrow without a revolutionary upheaval. A more gradual evolutionary development through the institution of basic reforms by constitutional processes is possible but would require foreign support for its success. In view of their cultural background the educated sections of the population would welcome such support from the Western democratic world from which they expect enlightened cooperation and help in bringing about the basic reforms and developments required.

The underdeveloped state of agriculture in the countries of the Near and Middle East sets limits to their capacity for industrialization. Because of the low purchasing power of the rural population and the limited market for manufactured goods, there is little scope for large-scale, low-cost manufacturing enterprises capable of competing against the products of the industrialized nations. It may be possible to develop some manufacturing industries with the help of tariff protection; but in the long run, efficient and competitive industries must depend on a large market to make possible mechanized, low-cost, large-scale production. In the Near and Middle East the extent of the market is limited, on the one hand, by the relatively small population of countries separated by tariff barriers, and on the other hand, and even more so, by the low purchasing power of the majority of the population. Finally, the development of manufacturing industry is hampered by the insufficiency of capital for investment resulting from the low income of the people and their limited ability to save.

The economic backwardness and poverty of the people of the Near and Middle Eastern countries result in many social problems which are characteristic of underdeveloped countries in general. There is a high degree of illiteracy which hampers progressive development both in social and economic affairs. The proportion of illiterates exceeds 80 per cent in many areas. Superstition is prevalent and reactionary social traditions and customs govern the lives of the people. Disease is rampant, epidemics from time to time taking a heavy toll of populations already weakened by undernourishment or defective diet. Social services in general are either nonexistent for the majority of the population or are in a rudimentary state. In fact, in most of the countries of the Near and Middle East, government is re-

garded by the majority of the people as an instrument of coercion and oppression. Public officials are feared and shunned; in many cases they are positively disliked and only the most necessary contacts with them are made. This attitude is the result of long periods of autocratic government or of foreign conquest and domination. Even with the attainment of independence and the establishment of democratic institutions, the same outlook toward government still exists and can be changed only gradually.

In any case, the establishment of independent national governments is not enough. It is necessary that such governments be truly democratic and representative of the people. However, reform cannot be effected where, as a result of the semifudal social structure, governments are controlled by reactionary forces whose interests are threatened by social progress and enlightenment. The basic problem is one of education by which the emancipation of the people can be gradually achieved. But the reactionary semifudal forces in control of the government are generally in opposition to educational programs and movements which threaten to do away with their authority over the people.

Another major obstacle to the development of education and social services is the weak financial position of most of the governments of the Near and Middle East. They have limited funds which are mainly devoted to the most essential functions of government, such as security, justice, and necessary administrative services. Only a small proportion of the budget is devoted to education, public health, and public works. The income of the government is not only limited by the low national income, but also by its inability to tax effectively the politically powerful rich classes which exercise control over it. In fact, in most of the countries of the Near and Middle East the taxation system is the most backward and inefficient part of the governmental structure. It usually consists mainly of indirect taxes which fall more heavily on the poorer classes. Even where direct taxes are instituted, they cannot be administered properly so as to insure collection from wealthy landowners and businessmen. Instead of contributing to a reduction of the great inequality of wealth, the taxation system perpetuates and aggravates that inequality.

The social and economic problems of the countries of the Near and Middle East are all intimately related. They all form part of one pattern and constitute one complicated problem of underdevelopment in all fields of economic and social life. With conflicting ideologies and divergent pressures coming from the outside world, this immense and complicated problem cannot be solved by the efforts of the people of these countries alone. Such advances as have been made by some of the governments of the region, sometimes with private and public help from the West, fall far short of the requirements of social and economic development. Considerable help is needed from the more advanced countries in bringing about a more progressive social and economic system in the Near and Middle East. Certainly within the United Nations, and possibly also through bilateral arrangements, important results may be achieved in promoting the economic and social advancement of the countries of the region. The Charter of the United Nations provides for cooperation between the advanced nations and the underdeveloped countries

for that purpose. It is also the policy of the United States government, as proclaimed by President Truman in his Point Four Program, to assist with its scientific and industrial resources in the improvement and growth of underdeveloped areas. Such assistance, both technical and financial, is badly needed by the countries of the Near and Middle East. On the other hand, communism has infiltrated into these countries and is appealing to the downtrodden masses with glowing promises of a better life achieved through Communist-directed revolutionary changes.

The most important question is what road will the countries of this strategic region follow. Under pressure of world developments they are presented with a choice between Western political democracy with an economic system of capitalist free enterprise or of the mildly Socialistic economy of the welfare state on the one hand, and the Communist-led system of planned socialism requiring a radical transformation of existing social, economic, and political institutions.

This choice is being rapidly forced on them both by their internal evolution and by the impact of world pressures and developments. The poverty-stricken, disease-ridden masses of the Near and Middle East are slowly awakening to the misery of their condition and gradually are realizing that it is not unalterable. The remarkable development of the means of communication in recent years has brought them into contact with more advanced nations whose scientific and technological progress has made possible higher standards of living for all classes of the people. The instruments and machines of modern industrial civilization have reached them both in peace and in war. They are being told that there is hope for improvement of their condition and that they can produce more with new instruments and methods and so raise their standard of living. They are coming to realize that they can be rid of diseases and epidemics and that their work need not be painful and strenuous. Their right of education is being affirmed, and they have come to believe that they need not remain illiterate and ignorant. With this growing realization that it is possible for them to have a better life, their desire for improvement is gradually becoming an insistent demand for a higher standard of living. This demand constitutes a challenge not only to their own governments but also to the more advanced and powerful nations. There is little hope in the present world situation that the governments of the Near and Middle East would meet this challenge effectively by themselves. Some of them, like Turkey and Greece, have made remarkable advances with financial and technical help from the United States. But most of them are unable, by their own efforts and resources, to effect more than a few superficial reforms and small-scale development projects which would prove to be inadequate to meet the seriousness of their situation. The reactionary forces opposed to social and economic advancement are still powerful, while the progressive forces have not yet developed enough strength to enable them to gain control of the government and to bring about basic reforms and progressive social transformation. Moreover, the Western powers have in the past generally supported the reactionary semi-feudal forces which stand for the maintenance of an outworn social system destined to disappear and have thus incurred the enmity of the rising progressive forces. However, these forces can

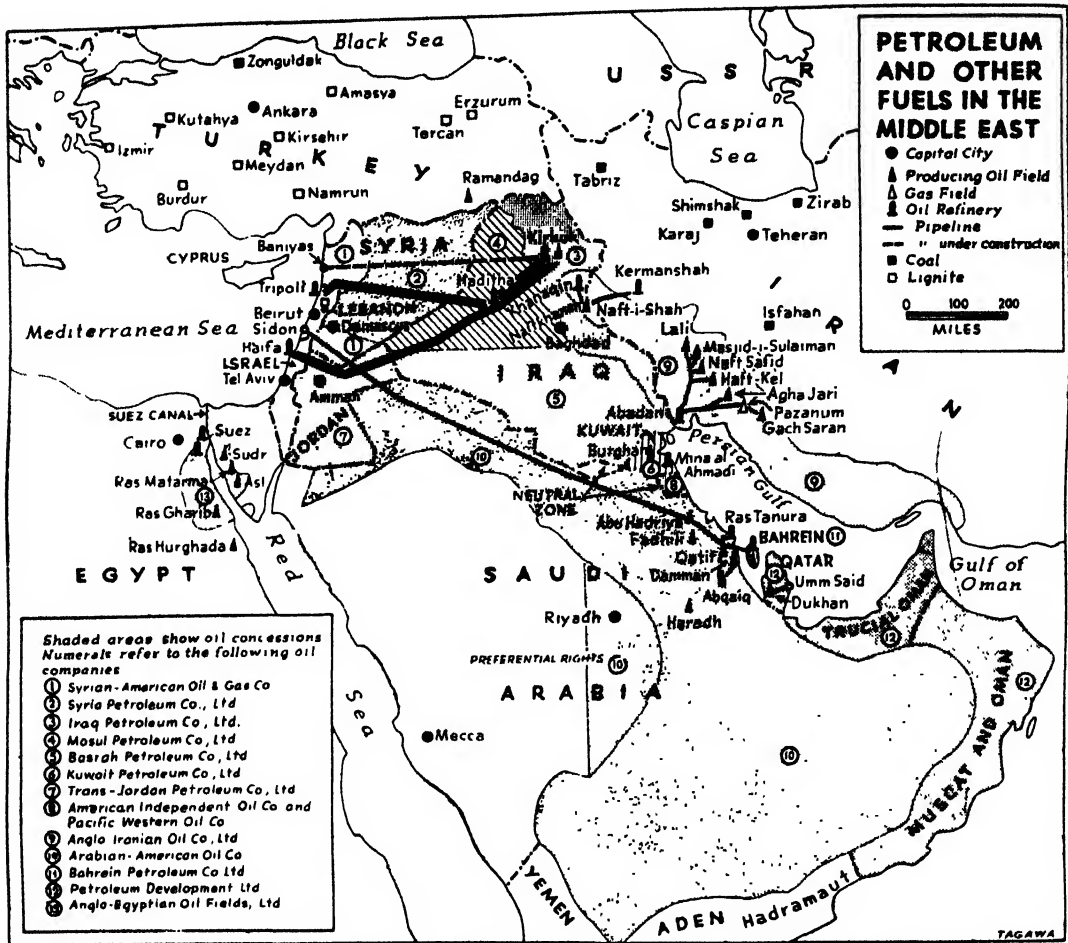

be won over to the cause of democracy and would be eager to cooperate with the freedom-loving peoples of the Western World on the basis of new concepts and methods capable of promoting the economic and social development of the countries of the Near and Middle East.

In this regard the aims of the United States and its Western European allies must be clear and forceful, for as a result of their experience under the domination of Western European imperialism, the peoples of the Near East are suspicious of the policies of the Western powers. While technical assistance from them may be welcome, there is still fear of Western economic imperialism, as well as doubt that private capital from Europe and America would be willing and able to promote economic development for the interests of the people of the region. Foreign corporations have engaged in the past, and continue to engage at present primarily in making high profits without contributing much to the economic development of these countries. Moreover, it has been difficult for the weak local governments and for labor which is largely unorganized to influence the price and wage policies of these powerful foreign corporations. For instance, they have practiced discrimination in favor of their foreign employees by giving them the most responsible positions and by paying them much higher salaries than local employees. Past experience with private foreign capital points to the danger of exploitation of the people by powerful foreign monopolistic interests which would lead to a reaction against the Western powers and their economic policies in the Near and Middle East. If the peoples of this region are not effectively helped in their social and economic development by the United States and Western Europe but are, on the contrary, exploited by American and Western European capital, they may be induced to travel along the road leading toward communism which presents itself as a tempting solution to their backwardness and their misery. To prevent such a development, Western democracy must come forward boldly and vigorously with farsighted policies and effective plans for helping the countries of the Near and Middle East in a courageous and well-directed effort to attain higher standards of living and greater freedom for their peoples.

GEORGE HAKIM,
Counselor of the Legation of Lebanon and Delegation to the United Nations.

17. PETROLEUM. The Middle East probably has the greatest oil deposits in the world; the proved reserves constitute two fifths of the world total, and the geological formation makes low-cost production possible. Oil is, however, unequally distributed over the region. Hence, while oil plays a leading part in the economy of the countries bordering the Persian Gulf, its contribution to the other Middle East countries is slight or negligible.

The existence of oil in the region has been known since ancient times, but Middle Eastern countries lacked the technical skill necessary for its exploitation, as well as the large capital investment required not only for extracting the oil but for transporting it by pipeline over long distances to ports. Therefore, the industry has been established in the region by foreign interests, mainly British and American, which brought in capital, introduced necessary skills, and provided

markets. Oil production, begun shortly before World War I, has shown an almost continuous expansion, accelerated during and after World War II.

World Position.—According to estimates for early 1949, proved oil reserves in the Middle East account for about 42 per cent of the world total, as compared with 35 per cent in the United States and 12 per cent in Venezuela; most of the remainder are in the Union of Soviet Socialist Republics and Indonesia. These Middle Eastern reserves are located mainly on the shores of the Persian Gulf in Kuwait, Iran, Iraq, and Saudi Arabia. The potential reserves are believed to be much larger than the known reserves.

Before World War II the region supplied a small portion (3.6 per cent in 1928 and 6.4 per cent in 1938) of the world crude oil output, excluding that of the USSR. Middle East production amounted to 16 million metric tons in 1938, reaching 58 million tons in 1948, 71 million in 1949, and about 88 million in 1950. The region contributed 13.1 per cent of the world supply (excluding that of the USSR) in 1948, and 16.4 per cent in 1949, compared with 6.7 per cent in 1944. At the end of 1950, the Middle East was producing at a rate equal to almost one fifth of the world total.

The main producers in 1949 were Iran, traditionally the most important in the region, Saudi Arabia, and Kuwait. Iraq, which before 1945 had been the second largest producer, had become

the fourth. Other producers are Egypt, Bahrain, Qatar, and Turkey.

Most of the important fields in the region have been discovered only comparatively recently; during World War II the execution of plans for expansion of the industry was delayed because of shortages of materials, equipment, and manpower. Inadequate transport facilities were another major obstacle. There are large-scale plans, however, to develop both the oil resources and the transport facilities of the region in order to enable Middle Eastern output to meet an increasing proportion of the growing world demand for petroleum.

Refineries.—Refining capacity and the production of refined oil products in the Middle East have increased considerably since 1940. This is owing to the expansion during the war and the postwar period of the refineries in Abadan, Iran; Haifa, Israel; Bahrain and Suez; and the construction of refineries in Ras Tanura, Saudi Arabia; Tripoli, Lebanon; and Kuwait. At the end of 1948 there were 12 refineries in the region with a total daily capacity of about 940,000 barrels.

Despite considerable expansion in the refining capacity of the region, the amount refined remains substantially below the crude production of the area. In 1949, Middle Eastern refineries were capable of processing about 300 million barrels of the total 530 million barrels of crude production. The remainder was exported in crude form.

mainly to Europe and North America, where it was refined.

Pipelines.—Lack of adequate transport facilities has hampered the expansion of oil production in the Middle East. To remove this obstacle, the petroleum companies of the region have undertaken the construction of ports and pipelines. The chief ports which the oil companies utilize to handle the exports of the region are Haifa, Sidon, and Tripoli on the eastern Mediterranean coast, Abadan and Bandar Mashur in Iran, Ras Tanura in Saudi Arabia, Mina al Ahmadi in Kuwait, Umm Said in Qatar, and Bahrain on the Persian Gulf. These ports are the terminals of pipelines or possess refineries.

Certain petroleum companies of the region, in order to expand their exports and to reduce transport charges, have undertaken the construction of large pipelines from the oilfields to the eastern Mediterranean coast. Pipelines from Kirkuk to Tripoli and from the Arabian oilfields to Sidon have been completed, and plans are under way for the construction of others. In addition, there are numerous small pipelines connecting the oilfields of Bahrain, Iran, Kuwait, Qatar, and Saudi Arabia with their Persian Gulf ports.

Production and Transportation Costs.

There are indications that the production costs of crude petroleum in the Middle East are considerably below those of other major producing areas, in spite of the large capital investment required for extraction and transport. Almost all Middle Eastern petroleum is extracted from flowing wells, and the equipment is of high quality. The production rate of these wells, which aggregated 396 at the end of 1949, is high; their daily average output was about 3,728 barrels, compared with an average of 11 barrels for 450,000 wells in the United States, and 21 barrels for the world. Labor costs are low, and petroleum production per worker is comparable with that of the United States and Venezuela. In the Middle East, royalties and tax payments ranged between 13 and 35 cents (U.S. currency) per barrel in 1948, while in Venezuela the average for 12 major oil companies was 86 cents, although royalty rates were subsequently raised in several Middle Eastern countries.

Information concerning the actual cost of production of petroleum is not available for most of the Middle Eastern countries. The production cost of crude petroleum at the end of 1947 in Saudi Arabia was estimated at 24 cents per barrel, excluding a royalty payment of about 21 cents and the cost of transport to the refinery of 2.5 cents. The cost of production in Saudi Arabia may be regarded as roughly representative of the cost of crude production in other major oil-producing countries of the Persian Gulf. In Venezuela the average cost of crude production of the 12 major oil companies in 1948 was about 68 cents per barrel, excluding taxes and royalty payments.

The geographical position of the Persian Gulf oilfields necessitates heavy transportation costs in order to reach world oil markets. The greater part of Middle Eastern oil passes through the Suez Canal and has to pay a toll, which in August 1949 amounted to 18 cents per barrel. As a result, the transport cost of oil in 1949 from the Persian Gulf to Southampton, England, was from \$1.04 to \$1.08 per barrel, compared with 50 to 55 cents a barrel from Puerto La Cruz, Venezuela, to Southampton.

World Markets.—The importance of Middle Eastern oil in world markets has increased rapidly. In 1946, the Middle East (excluding Egypt) had an exportable surplus of petroleum amounting to 545,000 barrels per day in comparison with 1,028,000 barrels per day in the Caribbean area, while in 1949 the corresponding figures were 1,191,000 barrels and 1,251,000 barrels, respectively. In addition to its own requirements, which increased from 145,000 barrels per day in 1946 to 212,000 in 1949, the Middle East has met the main part of the petroleum deficits of Europe, the Far East, and Africa. There have even been shipments of crude oil to North America, despite the long sea haul. During 1949 and 1950, sales and prices of Middle Eastern oil were affected by the general dollar shortage and by the devaluation of several European currencies. It is expected that more Middle Eastern oil will reach world markets as pipeline facilities to the eastern Mediterranean become available, replacing the tanker transport of 3,600 miles by little more than 1,000 miles of pipeline and eliminating the payment of Suez Canal tolls.

Local Importance.—The contribution of oil to the economy of the various Middle Eastern countries differs widely. In such countries as Iran and Iraq, oil constitutes one of many sectors of the economy and accounts for only a small part of the national income, while it plays an important part in the balance of payments and the government budget. Thus, in Iran direct payments by the oil industry to the government, together with local expenditures, such as wages and purchase of materials, do not exceed 10 per cent of the national income; of this total, royalties represent a third. Similar proportions obtain in Iraq. In Bahrain and in Kuwait, on the other hand, oil extraction ranks higher than all other economic activities together. In Kuwait, the number of local workers employed in the petroleum industry, and their dependents, constitute about a fifth of the total population; in Bahrain they represent a fourth.

The oil companies have contributed directly in varying degrees to the development of the areas in which they conduct their operations. They have often built roads, cleared large areas of the countryside, organized transport facilities, and established new settlements. In some countries, the oil companies have assisted the government, by providing technical advice and advance payments on account of future oil royalties, in the implementation of the country's general development plans. Thus, in Saudi Arabia and Bahrain, the companies have provided technicians, machinery, and seeds for agricultural programs, have installed medical and educational facilities, and have constructed works for public use.

Foreign Exchange.—Most of the petroleum companies which operate in the Middle East and are owned by foreign interests have, in many cases under their concession agreements, the right to dispose freely of their foreign exchange earnings. Thus, the foreign exchange proceeds of oil exports are not under the control of the governments, and a considerable part of the earnings of oil companies do not return to the producing countries, except in the form of investment.

Nevertheless, the oil companies play an important role in the balance of payments of oil-producing countries of the Middle East. They supply substantial amounts of foreign currency to the local economy in the form of direct payments

to governments, local expenditure on production and construction, and advances to governments on account of future income from the petroleum companies.

This has made possible a large expansion in the import trade of the oil-producing countries, but a part of the increase has consisted of food, luxuries, and manufactured goods—part at least of which could be produced locally—rather than capital goods and machinery.

Fuel.—Petroleum constitutes by far the most important source of energy used in the Middle Eastern countries. It is cheaper in the Middle East than other fuels, and its price compares favorably with that of petroleum in other countries, especially nonproducing countries. But in several countries prices are raised considerably by excise duties. Most of the oil concessions and pipeline agreements contain provisions for supplying the oil requirements of the country, but the demand for petroleum and its products in the region, though increasing, is small. In irrigation, agriculture, and mining many of the operations are still largely performed by primitive methods involving the use of human energy or draft animals. Petroleum provides a source of fuel in the Middle East for motor vehicles, domestic uses, production of electricity in the cities and, in some countries, for agricultural pumping machinery and small-scale industries. A significant part of the local consumption of oil meets the needs of the oil companies themselves and of bunker supplies for ships passing through the eastern Mediterranean and the Red Sea.

Employment.—In the course of their activities, petroleum companies in the Middle East employ a certain number of workers and provide some technical training. The labor-absorbing capacity of the industry is, however, by its very nature, limited; therefore, except in Bahrain and Kuwait, the total number engaged in the oil industry constitutes only a small fraction of the population. Even if fields complementary to petroleum production proper are included, the total employment is not great. Nevertheless, in several countries of the Middle East the oil companies are by far the largest employers of industrial workers. The petroleum companies in these countries have directly provided jobs for more than 100,000 local workers.

In the Middle East as a whole, about 85 per cent of the total number of petroleum company employees are nationals of the countries concerned, and in some concession agreements provisions have been inserted in favor of employing local workers. One of the main obstacles to the employment of nationals is the shortage of workers with the required industrial background, at least in the early stages of exploration and production.

The absence of technical training and experience among the workers of the Middle East has made it necessary for the petroleum companies in the region to promote the training of skilled and partially skilled workers and supervisors, with emphasis mainly on methods of increasing productivity and of enforcing safety standards. The major training and educational programs of the oil companies include general education to eliminate illiteracy, together with vocational training and some education at the college level. The competition between oil and other industries for the employment of the limited number of Middle Eastern skilled workers has thus been reduced

to a great extent, and the development of other branches of the national economies hindered as little as possible.

NOTE:—The preceding section on *Petroleum* is based on the *Review of Economic Conditions in the Middle East*, chap. 3, published by the United Nations Department of Economic Affairs (New York, March 1951).

Individual Countries.—Iran and Saudi Arabia have, in normal times, the greatest production of petroleum in the Middle East, followed by Kuwait, although production there was started comparatively recently.

Bahrain.—Petroleum on this island was the first produced in the general area of Saudi Arabia. The concession, covering the entire island, is operated by the Bahrein Petroleum Company, Limited (owned equally by the Standard Oil Company of California and The Texas Oil Company). Production began in 1933, and in 1950 was 1,512,000 metric tons. The refinery, with a capacity of 155,000 barrels per day, obtains additional crude oil from the production of the Arabian-American Oil Company through pipelines to the mainland of Saudi Arabia.

Egypt.—The Egyptian fields are located along both shores of the Gulf of Suez, south of the canal. The production in 1950 was somewhat more than 2,328,000 metric tons. The chief fields are Ras Gharib, Ras Matarma, Sudr, Asl, and Ras Hurghada, although the latter in 1948 had declined to a yield of 900 barrels a day. Both the Ras Hurghada and Ras Gharib fields are operated by British interests. The newer fields of Sudr (1948, operated jointly by the Socony Vacuum Oil Company and Anglo-Egyptian Oil Fields, Limited) and Asl (1949) indicate a greatly increased Egyptian production.

Iran.—Production from the huge fields of the Anglo-Iranian Oil Company, Limited (52.5 per cent owned by the British government) in 1950, before the application (1951) of the law nationalizing its properties, was 32,259,000 metric tons. Production began in 1913. Anglo-Iranian's concession measures about 100,000 square miles.

Iraq.—The greatest production here is in the Kirkuk field (developed in 1927 and operated by the Iraq Petroleum Company, Limited—total concession, 32,000 square miles) at the end of a double pipeline leading to Tripoli in Lebanon and Haifa in Israel. The pipeline in normal times conveys 80,000 barrels a day. A field at Basrah (Basrah Petroleum Company, Limited, owned by Iraq Petroleum) has a smaller production of a very high grade. The total production in 1950 was 6,600,000 metric tons.

Kuwait.—This small country has the largest single oil structure yet found—about 75 square miles. The first oil was struck in 1937 at Burhan, but due to World War II commercial production was not reached until 1946. The production in 1950 was 17,280,000 metric tons, and the proved oil reserves (1949) are 1,487,000 metric tons, the largest in the Middle East. The Kuwait Oil Company, Limited, having a concession over the entire area, is owned jointly by the Gulf Exploration Corporation and the Anglo-Iranian Oil Company, Limited.

Qatar.—The concession of Petroleum Development (Qatar), Limited, a subsidiary of the Iraq Petroleum Company, Limited, covers the entire area. Production began in 1949, and in 1950 was 1,635,816 metric tons.

Saudi Arabia.—The Arabian-American Oil Company (owned since 1939 by four American

companies) has a concession of 440,000 square miles. Production began in 1936; in 1938 it was 67,000 metric tons; in 1950, 26,905,000 metric tons were produced. A total personnel of 17,345 was employed in 1950, of which 2,826 were Americans, the rest Saudi Arabians. Of the latter some 4,600 were enrolled in the education program conducted by the company.

Turkey.—The first production was in 1940 in the Ramandag area in the Tigris Basin of south-eastern Turkey. The production in 1950 was somewhat more than 15,536 metric tons.

18. THE UNITED STATES AND THE SOVIET UNION IN THE MIDDLE EAST.

At the intercontinental crossroads between Europe, Asia, and Africa, between the Mediterranean and central Asia, the Near and Middle East of today is a focal point of international interest, even as it has been almost from the dawn of history. It could, perhaps, be said to have emerged into modern history with the opening of the Suez Canal in 1869. The interest of imperial Russia and the Soviet Union in this vast area, with its population of some 100,000,000 people, mostly of Moslem faith and somewhat varied culture, is obvious and long-standing. Despite the recent development of a somewhat dynamic nationalism within some of the indigenous elements in the Middle East, a widespread poverty has made the people something of a prey to Soviet Communist propaganda. The political and imperialistic character of Soviet aspirations in the area became quite evident during the course of World War II—if they had not already become clear—and more particularly during the Hitler-Molotov discussions of Nov. 12-13, 1940.

American interest in the Near and Middle East also is long-standing, although Americans themselves are not too often aware of the fact. This interest has been evinced not only in the religio-cultural and philanthropic realms, but also in the economic sphere, particularly in oil and tobacco. It may be noted, for example, that the Middle East contains two fifths of the proved oil reserves of the world, accounts for one fifth the current production, and supplies Western Europe with 90 per cent of its crude, and 75 per cent of its total oil imports.

The first American treaty of commerce and friendship with the Ottoman Empire dates from May 7, 1830, when the United States, even at that early date, manifested an interest in commercial freedom in the Turkish Straits. American educational institutions, such as Robert College (opened 1863), the American University at Beirut (1866), Istanbul Women's College (1871), and the American University at Cairo (1919), to mention only a few, exerted a basic influence throughout the Middle East, as well as elsewhere. In a very real sense, however, it was World War II which brought out the American political and strategic interest, one expression of which came on Dec. 3, 1941, when President Franklin D. Roosevelt, in extending lend-lease assistance to Turkey, almost on the eve of the Japanese attack on Pearl Harbor, declared the defense of Turkey vital to the defense of the United States. President Harry S. Truman, on April 6, 1946, noted that the Middle East, because of its vast natural resources and of the fact that it lay across routes of land, air, and water communications, was "an area of great economic and strategic importance," the nations of which were

"not strong enough individually or collectively to withstand powerful aggression." While it was not difficult to see how such a region "might become a center of rivalry and conflict," the president expressed the view that "no country, great or small, has legitimate interests in the Near and Middle East which cannot be reconciled with the interests of other nations through the United Nations. The United Nations have a right to insist that the sovereignty and integrity of the countries of the Near and Middle East must not be threatened by coercion or penetration."

As an example of the continued interest of the United States in the Near and Middle East, following the close of the London Conference between the United Kingdom, the United States, and France, both the United States and the United Kingdom issued statements with respect to Greece, Turkey, and Iran, on May 19, 1950. The American secretary of state, Dean G. Acheson, reaffirmed "the deep interest of the United States in the security of Greece, Turkey and Iran and our determination to continue our policy of supporting these and other countries which are striving through military and economic efforts to safeguard their independence and territorial integrity." A few days later, on May 25, the United States, the United Kingdom, and France announced agreement to supply arms to Israel and the Arab states only for "legitimate self-defense." President Truman declared that the three-power statement was designed to promote peace in the Near East.

In October 1950, Greece and Turkey accepted invitations issued in September to become associated with appropriate defense planning of the North Atlantic Treaty Organization with regard to the Mediterranean area.

Aside from the resurgent nationalism of the Middle Eastern peoples, the new factors at play in the region in the postwar era were undoubtedly the dynamism of Communist action and propaganda, in the service and in the interest of the Soviet state, and the position of the United States, granted that France and the United Kingdom also had long-standing interests with which they were concerned. In view of the common victory in the war against the Axis, there was some prospect of pacific adjustment, economic reconstruction, and political stability in the Middle East in the postwar era, especially if external political security, not subversion or control of the states along its frontiers, was the desideratum of the Soviet Union. Many of the problems, and more particularly problems pertaining to Greece, Turkey, and Iran, were discussed in some of the great international conferences held during the war and the immediate postwar period, such as those at Moscow, Teheran, and Cairo (1943) and Yalta and Potsdam (1945). (See also FACTS AND CONFERENCES.)

In the postwar period, however, it seemed clear that the Soviet Union, contrary to its announced position at Teheran and Yalta, was reluctant to withdraw its military forces from Iran. Evidently Soviet policy had reverted to the position of November 1940 when it had been stated that "the area south of Batum and Baku in the general direction of the Persian Gulf" constituted "the center of the aspirations of the Soviet Union." In any case, contrary to its wartime promises, Soviet troops were not withdrawn, and Soviet policy encouraged the dissident pro-Communist Tudeh Party in subversive activities

against the government of Iran, especially in the Province of Azerbaijan. The result was that the Iranian government, in the first case of its kind, brought the issue before the Security Council of the United Nations on Jan. 19, 1946. It charged the Soviet Union not only with keeping its forces on Iranian soil contrary to its agreements and the wishes of the Iranian government, but also with interfering in Iran's internal affairs in an attempt to subvert the government of the country. Both the United Kingdom and the United States firmly supported Iran in its appeal to the United Nations regarding Soviet actions and, in the end, Soviet troops were withdrawn; in December 1946, Iranian forces moved into Azerbaijan. The Security Council, however, has retained the Iranian question on its agenda. The Soviet Union, meanwhile, has continued an intermittent pressure and propaganda against Iran, while the United States has sought to bolster Iran's independence and to encourage economic reconstruction. In the interest of cementing American-Iranian relations and of acquainting Americans with the problems of Iran, the shah of Iran visited the United States in November-December 1949.

On Oct. 19, 1950, Iran and the United States signed the first Point Four agreement allotting \$500,000 to Iran, raising to \$120,000,000 grants and credits extended to Iran, while an Export-Import Bank loan had been approved on October 10. A Soviet-Iranian trade agreement was signed on Nov. 4, 1950.

The Republic of Turkey offers another example of the significant development of American interest in the Near and Middle East since the end of World War II and of the conflict of policy between the United States and the Soviet Union. But the issues involved did not reach the acute stage as in the instances of Iran and Greece, partly because there was no indigenous Communist Party in Turkey and because of the firm determination of the Turkish people and the Turkish government, in any event, to resist overt aggression against Turkey. Soviet designs on the Turkish Straits and Turkish territory, despite the Anglo-Soviet statement of Aug. 10, 1941, confirming Soviet fidelity to the Montreux Convention (1936) and indicating that the Soviet Union had no designs against Turkish territory, appeared to be those set forth in the Hitler-Molotov discussions of November 1940, when revision of the Montreux Convention in the interest of the USSR was demanded. On March 20, 1945, the Moscow government denounced the long-standing Soviet-Turkish treaty of nonaggression (1925, 1929, 1941), and on June 7, 1945, it was indicated to the Turks that the Montreux Convention should be revised to permit joint Soviet-Turkish defense of the Straits, and that the Kars-Ardahan region should be ceded to the Soviet Union. On Nov. 2, 1945, the United States, in view of the discussions at the Yalta and Potsdam conferences, set forth its views that (1) the Turkish Straits should be open to the merchant vessels of all nations at all times, and (2) to the transit of the warships of Black Sea powers at all times, with (3) passage of the warships of non-Black Sea powers permitted only through the specific consent of the Black Sea powers or when acting under the authority of the United Nations. These principles were rejected by the Soviet Union, in its note of Aug. 7, 1946, when it insisted that the establishment of a "new regime"

for the Straits should be the sole concern of the Black Sea powers and that Turkey and the Soviet Union should organize the joint defense of the Straits. Turkey rejected the Soviet position because of its obvious implications, and the United States, together with France and the United Kingdom, continued to take the position that legitimate Soviet interests could be served without sacrificing the independence of the Turkish Republic. Interestingly enough, the United States became one of the first commercial powers in the Straits during the postwar period, assuming first place in 1945-1947. American commerce continued to lead that of the USSR in the Straits in 1950. While the American, British, and Turkish governments were all willing to discuss the problem of the Straits in an international conference, the Soviet government evidently saw no useful purpose in entering such a conference, and the public discussion of the problem of the Straits came to an end in the autumn of 1946.

Nevertheless, the pressure on Turkey continued, in the press and over the radio, as well as otherwise, and as late as Oct. 24, 1947, Andrei Vyshinsky, then deputy foreign minister of the Soviet Union, made reference to the Kars-Ardahan region during a denunciation of the Turkish government in the Political and Security Committee of the General Assembly of the United Nations. Because of this constant pressure, of the tremendous defense burden placed on the Turkish government, and of the importance of Turkey as a factor of stability in the Middle East, President Truman, on March 12, 1947, included Turkey in his statement of the so-called Truman Doctrine, and \$100,000,000 in military and economic assistance was earmarked for Turkey, an amount which by 1950 had been extended to approximately \$164,000,000. In addition to technical assistance in economic development under this program, American military and naval advisers were sent to Turkey to assist in training the Turkish armed forces for purposes of defense against possible aggression.

Greece represents another, and perhaps the most striking, example of the troubled situation. Attacked by Italy, Germany, and Bulgaria during the war, victim of Italian, German, and Bulgarian invasion and occupation, torn by internal dissension, materially and spiritually wounded by war, Greece became the center of an international Communist attempt to overthrow its constitutional system in the period following the war. In view of Soviet promises to Bulgaria in November 1940 as to both Greek and Turkish Thrace, and of Bulgarian and Yugoslav aspirations to Greek Macedonia, there appeared to be little question that, in assisting the Greek guerrillas, one aim, at least, was the establishment of another Communist dictatorship in Greece, and the possible detachment of Greek Macedonia from Greece. When the United Kingdom, in February 1947, announced it could no longer shoulder the burden in Greece, the United States began its program of assistance under the Truman Doctrine, announced on March 12, 1947. Some \$600,000,000—about 70 per cent of which went to military assistance because of the seriousness of the guerrilla warfare—was extended under this program, and altogether more than \$1,000,000,000 in the period from 1944 to 1950, in one form or another. Expenditures for military aid to Greece and Turkey during the three-year period 1947-1950 were in the neighborhood of \$700,000,000.

Together with other interested powers, the United States also carried the problem of threats to the political independence and territorial integrity of Greece to the United Nations which since 1947 has had a Commission of Investigation, and also the United Nations Special Committee on the Balkans (UNSCOB, 1947-1950), with observational and conciliatory functions, in Greece, in an attempt to solve the problem. It is interesting to observe that, like the original Commission of Investigation, UNSCOB has found abundant evidence as to foreign Communist assistance to the Greek guerrillas, the vital importance of which was openly proclaimed by the Greek Communist Party in January 1949. Moreover, on Jan. 23, 1951, the Greek Communist Party declared that if the "Democratic Army of Greece" had won in 1946-1949, Greece would now be "under the warm aegis of the Soviet Union" like the other "people's democracies." As a result of American assistance, the work of the United Nations in Greece, and the determination of the Greek people themselves, the guerrilla movement was crushed in 1949, and Greece, as indicated in the elections of March 5, 1950, was given a renewed opportunity for political, social, and economic reconstruction.

These are but three of the most significant instances illustrating the vital place of the Middle East in the troubled world of today. They are selected for purposes of brief characterization because they have been so striking, and because the pressure on Greece, Turkey, and Iran has been more direct. Yet the conflict in the Middle East is not confined to these countries, which are merely on the periphery of a much vaster area. But because of their geostrategical location they have borne the brunt of the Soviet pressure thus far. The conflict is not merely a struggle between the Soviet Union on the one hand, and the United States and the United Kingdom on the other, or even between East and West. The Middle East as a whole has been involved, including the Levant, Palestine, Jordan, Iraq, Egypt, and Saudi Arabia. In the interest of preserving the area as a bastion of the free world and of developing it along the road to economic reconstruction and progress, the Point Four and Technical Assistance programs have been developed, the end results of which yet remain to be seen.

HARRY N. HOWARD,
*United Nations Adviser, Bureau of Near Eastern,
South Asian and African Affairs, U.S. Department of State.*

19. THE IMPORTANCE OF THE MEDITERRANEAN. At midpoint of the 20th century the United States had a naval force of considerable size stationed in Mediterranean waters and was also building up airbases on Mediterranean shores. Moreover, under the North Atlantic Treaty (q.v.), it was joined in a defensive alliance with Italy—a Mediterranean state; with France—a state with Mediterranean interests and dependencies; and with Great Britain, whose interests in the Mediterranean basin had been called vital for over two centuries. Finally, the United States was furnishing two other Mediterranean states—Greece and Turkey—with military and economic assistance to sustain their independence. (See section *The United States and the Soviet Union in the Middle East.*)

Fifteen years earlier, in 1935, the United States had no military forces in the Mediterranean and no notion of ever finding it important to station any there. Its active contacts with the region were commercial and philanthropic, carried on by individual Americans pursuing their private ends. Its diplomatic interest and influence were best reflected in a note of the Department of State which said, "Following the traditional American foreign policy, which forbids participation by the United States in . . . questions which are entirely European in their scope, the Government must refrain from any expression of opinion."

The change that has taken place in a short time is extreme. Yet there has been no particular marked alteration within the Mediterranean region. The changes have taken place elsewhere—in the position of the United States in the world and in the relations of the United States with the Soviet Union. Characteristically, developments in the outside world have had a powerful effect on the interest in the Mediterranean of states far removed from that region. An examination of certain geopolitical, historical, strategic, and economic factors will suggest the reasons for this.

There are two basic geopolitical facts concerning the Mediterranean. The first is that it links western Europe, North Africa, and the Middle East. The second is that, in conjunction with the Middle East, it forms a geographical unit which is the key sector of the Eurasian littoral.

The first of these two facts has been an important element in the history of the Western World. The second was an essential feature of the political and economic control which western Europe long exercised over the coastal regions of Asia. In the middle of the 20th century, both facts have a compelling influence on the policies and actions of the major powers of the world.

The basic historical fact is one on which British policy for a long time rested. Control of the Mediterranean seems to give a major power the ability to exert a degree of influence in central and eastern Europe, in the Middle East, and in Africa out of all proportion to the actual force maintained in the Mediterranean. The long British demonstration of this possibility was made, however, when the Russian Empire was not a strong and organized world power. It was also made in a time when Great Britain was establishing an unquestioned authority over the coastal regions of Asia.

Neither of these two conditions now exists. The Soviet Union is a strong and organized world power. The Asian littoral is politically broken up into relatively weak independent states, no one of which is capable of maintaining its independence by its own resources. This change, while possibly modifying the historical use of power in the Mediterranean, has increased rather than diminished the importance of controlling this region—or at least of preventing its control by another power. The British policy statement of 1936 was a clear appreciation of this importance. Then, in connection with the Italian-Ethiopian War, it was declared that British authority in the Mediterranean would be maintained at all costs because, if control passed to an unfriendly state, the international position of Great Britain would be vitally threatened.

The strategic significance of the Mediterranean follows from what has just been said. The

region is one in which small shifts in the relative influence of competing major powers can rapidly lead to comprehensive changes in their strategic positions with respect to each other. Strategically the Mediterranean is a highly sensitive area. (See also section *Geostrategic Uniqueness*.)

Economically, in the sense of being a producing area, the Mediterranean is not of the first importance. Its significance lies in its being a vital segment of a world system of distribution and communication. Transportation costs between western Europe and south Asia are related to the availability of the Mediterranean sea route. The economic distribution to Europe of the oil of the Middle East depends on a free use of the Mediterranean. The operation of a vast complex of air transport rests upon agreements with the states of the eastern Mediterranean.

There is one conclusion to be drawn from this brief survey. The Mediterranean has been, is, and will continue to be a focal point of policy for any world power that has global interests and that depends upon sea and air communications to maintain those interests. By the same token, the Mediterranean becomes an important consideration in the policy of a rival world power, by being a region in which the unrestricted use of sea and air routes can be seriously checked. This conclusion can be translated into a picture of the relations of the United States, Great Britain, and the Soviet Union in the year 1950.

It is certain that when the United States sent large military forces into the Mediterranean in 1942, its action was motivated entirely by the military consideration of defeating Germany and Italy. Even the extensive use of American resources by the Middle East Supply Center and the various other Allied civilian agencies had no other purpose than to maintain the basic economy of the area in order to have a stable base for military operations.

The British effort, even though linked with that of the United States in a combined command, did not and could not have so limited and concentrated a purpose. The Mediterranean was a vital factor in historical British policy and the considerations thus raised could not be overlooked. It was inevitable, in these circumstances, that the superior force of the United States would become linked with the British experience which defined control of the Mediterranean as the basis for exerting influence outside the Mediterranean.

By the end of World War II, the United States can be said to have positively supported the re-establishment of traditional British control. Two years later, in 1947, the United States can be said to have developed a national policy with respect to the Mediterranean which differed in no significant respect from that of Great Britain. The Truman Doctrine (March 1947) asserted the importance of the independence of Greece and Turkey, proposed economic and military assistance for this purpose, and acknowledged that such action was an acceptance by the United States of responsibilities which Great Britain had formerly carried but could no longer undertake.

This fully developed interest in the Mediterranean was not a sudden thing. It was the culmination of several years of military and political activity. It was also one of the consequences of the deterioration of the international situation; for relations between the major Allies of World War II did not grow into a pattern of increasing harmony, but into a pattern of conflict.

That this might be the possible character of these relations was felt at an earlier stage in the Mediterranean than elsewhere. In 1944, after Italy was defeated and it had become Anglo-American policy to restore a democratic Italy, relations between the major Allies began to deteriorate in the Mediterranean. Communist leaders took over the resistance movements in Yugoslavia and Greece¹ and turned against the governments in exile to which Great Britain was committed. The Soviet Union, after driving the German Army out of the Balkans, made political preparations for controlling Bulgaria, Rumania, and Yugoslavia. The Soviet Union also expressed an interest in the control of the Dardanelles, in base rights in the Dodecanese Islands, and in participating in the future control of the former Italian colony of Libya. Simultaneously, heavy pressure was brought to bear on the Turkish government to achieve some of these ends.

When the major powers conferred at Yalta (February 1945), their agenda contained 10 items representing specific issues that had developed in the Mediterranean and its Balkan hinterland. Although agreement was reached on many other matters at Yalta, the powers were unable to do more than note for future consideration the Mediterranean issues that had come before them.

These issues increased in number and grew in seriousness through 1945 and 1946. By the end of the latter year, the United States and Great Britain were following parallel and mutually supporting policies in the Mediterranean. The common feature of these policies was the intention of keeping the Soviet Union from gaining a foothold within the Mediterranean basin. For its part, the Soviet Union exerted a steadily mounting pressure to achieve precisely this end. Thus, before the Truman Doctrine was stated and before the idea of a "cold war" was generally admitted, the Mediterranean region was marked out as an area in which opposing purposes and interests came into recognized conflict.

The more this conflict extended to other parts of the world—Germany (1947), western Europe (1948), China (1949), and Korea (1950)—and deepened in intensity, the greater became the interest of the United States in the Mediterranean.

A question can be asked and answered at this point. Why did so extreme a shift take place in American thinking about the Mediterranean? It took place because the Mediterranean came to occupy a key strategic position in the security system which the United States began to construct after 1947. But although this position is comparable to that which the Mediterranean has in the British security system, it is not identical. In the American view, the Mediterranean is a key strategic area only in reference to the Soviet Union and its possible aggressive actions. There are two points to be noted in this connection. If the Soviet Union penetrated the Mediterranean, the economic communications of Europe with the Middle East and the Far East would be cut. Moreover, the access of the United States and Europe to the oil resources of the Middle East would be difficult at best and impossible at worst. Conversely, Anglo-American control of the Mediterranean allows sea and air power to come within striking distance of the industrial heart of the Soviet Union. Thus, Soviet policy is subject to the influence of this threat. When these two points have been noted, however, the basic inter

est of the United States in the Mediterranean is exhausted. (See also section *The United States and the Soviet Union in the Middle East*.)

Great Britain, while sharing this basic interest to the full, has supplementary interests which run far beyond those of the United States. These consist of an accumulation of commercial and financial relations, of political and cultural influences, of military bases and strategic understandings; the whole very completely integrated with the security and well-being of the British Isles.

The United States has no comparable set of interests in the Mediterranean. It is, however, dependent upon existing British relations to support the basic interest it has developed. The identity of this basic interest with that of Great Britain makes possible this unusual relationship between two great powers. The consequence of the relationship is, however, that the United States is generally obliged to support the supplementary interests of Great Britain in order to achieve its own essential interest, and Great Britain is generally obliged to accept the American definition of the basic interest in order to ensure its supplementary interests.

It is unlikely that the situation here described will undergo any radical change except under conditions of war. The Anglo-American combination that has developed in the Mediterranean is committed to perpetuating itself by the nature of the relations of each partner to the Soviet Union. It is in the Mediterranean and in the Middle East that these relations are most precariously balanced, for there the opposing powers come face to face. The least activity of the one is immediately felt and responded to by the other. Unless a new pattern in international relations develops and United States policy becomes less conditioned by considerations of security, the interest of the United States in the Mediterranean will be a continuing one.

20. THE LAW OF THE NEAR AND MIDDLE EAST. Practically the whole of the Near and Middle East was at some time or other under the rule of Islam, and Mohammedan law is still valid, to a greater or lesser extent, in most of the countries belonging to that region.

The sacred law of Islam, or the Shari'a, is based on four principles: the Koran, the practice of the Prophet Mohammed, the consensus of the community as represented by its scholars, and the method of reasoning by analogy. The consensus of the scholars is considered infallible, and what once has been sanctioned by consensus can (in theory at least) never be repealed. It therefore preserves all the details of the Shari'a in its traditional form, and has become the most powerful conservative element in Mohammedan law. Other factors making for rigidity were the impossibility of legislation after the death of the prophet when both the revelation of the Koran and the model practice of the prophet came to an end; also the conviction that grew up among the scholars from the 4th century of the hegira (the 10th century A.D.) onward that all essential questions had been finally settled, and that in future no one was entitled to deduce the law independently from its sources, but that all had

to follow the teaching of one of the recognized schools of law. The four schools of law that have survived in orthodox Islam until the present are the Hanafite, the Malikite, the Shafi'ite, and the Hanbalite schools. They regard one another as equally orthodox, and provide four alternative interpretations of the sacred law. The separate communities of the Shi'ites (in several branches) and of the Ibadites have their own systems of Mohammedan law.

This sacred law of Islam, as it was being elaborated by the scholars, developed from the beginning not in close connection with, but in conscious opposition to, the practice. It is not a system of law in the Western meaning of the term, but the expression of a religious ideal which, it is believed, was fully realized only in the early period of Islam. After the failure of repeated endeavors to put the sacred law into practice, of which the most notable example was the attempt of the first Abbasid caliphs of Baghdad, a balance gradually established itself in most Islamic countries between legal theory and legal practice. The theoretical validity of the Shari'a was acknowledged without reserve, but it was largely superseded in practice by administrative procedure and by commercial and other custom. The state increasingly assumed jurisdiction in matters of criminal law and taxation, as well as in the more important cases concerning property. This led to separate legislation alongside the Shari'a, of which the most important earlier examples are the Ottoman *kannun-nâmes* of the 15th and 16th centuries. The *cadi*, the judge under the sacred law, usually retained jurisdiction only on matters of family law or "personal status" (marriage, divorce, paternity, maintenance, guardianship, inheritance, legacies) and pious endowments (*waqf*), often together with other branches of land law—all subjects which were felt to be more or less closely connected with religion. Thus throughout Islam there arose a twofold administration of justice, the religious and the secular, long before any Western influence made itself felt.

As a body of religious duties, the Shari'a claims the allegiance of Moslems only, and both the theory of law and the practice of administration in Islamic countries left the non-Moslem communities free to bring the lawsuits that arose among themselves before their own communal authorities and have them settled according to their own religious or customary law. As a result of this, in most countries of the Near and Middle East the several religious communities have preserved their own personal status, even where the rest of civil law, penal law, and commercial law are uniformly ruled by modern codes. From the end of the 12th century onward, a similar status was given to the subjects of European countries, mostly merchants, who were temporarily resident in Islamic territory; the consuls of their own countries exercised civil and criminal jurisdiction over them. The details of these arrangements were settled in state treaties between Moslem and Christian rulers, and from the heads or paragraphs in which the terms were set out, these treaties were called capitulations. Though this development corresponded essentially with the doctrines of the Shari'a, the capitulations were actually modeled on the previous treaties of western Europe with Byzantium and the states of the Crusaders. The capitulations, which enabled strangers to live under their na-

tional laws in most countries of the Near and Middle East, remained in force in many cases well into the 20th century, but have now been abolished everywhere except for the zone of Tangiers and for the capitulation in favor of the United States in the whole of Morocco. In several countries of the region under consideration, however, the subjects of Western states have preserved their own personal status in the same way as the local non-Moslem communities.

A revival of Mohammedan law took place in the Ottoman Empire from the middle of the 15th to the end of the 16th century, and from that time onward the Shari'a in its Hanafite form actually ruled the law of contracts, obligations, and civil procedure in the Ottoman Empire. As part of the administrative reforms of the 19th century, this Hanafite law was codified and enacted as the *Mecelle* or Ottoman Civil Code in 1877. While in Turkey itself the *Mecelle* was superseded by the new Civil Code of 1926, it is still valid law (subject to later changes by legislation) in the territories that were detached from the Ottoman Empire in 1918. In recent years, under the influence of modern political and social ideas, the attitude of legislative bodies to Mohammedan law has changed considerably. The legislative powers are no more content to leave the sacred law undisturbed within its own, more or less restricted, sphere of personal status and law of *waqf*, but want to modify it, according to their own requirements. This has led to the unprecedented phenomenon of secular legislation concerning the Shari'a, a phenomenon which is apt to change its traditional character deeply. Starting with the Ottoman family law of 1917, most modernist legislation has taken place in Egypt from 1920 onward, and other countries in the Near and Middle East have followed suit. In contrast with the modifications to which the Shari'a has been subjected in independent Eastern countries, whether Islam is the official religion of the state or not, it has been maintained, practically unchanged, in those countries which are protectorates, colonies, or integral parts of Western powers.

This is the background of the legal situation in the several countries of the Near and Middle East, which can be summarized in a few representative examples as follows. See also ISLAM.

Morocco (French Protectorate).—In the greater part of the country, as far as the subjects of the sultan are concerned, the cadis apply Maliki law in matters of personal law of the Moslems and in matters of real property, as far as the land has not been put by its owners under French law; the secular tribunals of the sultan are competent for the rest of civil and commercial and for criminal matters. In the territories inhabited by Berber tribes, which before the protectorate were in a state of chronic rebellion against the sultan, customary law is applied by customary tribunals.

Egypt.—Hanafite law is applied to Moslems by cadis in matters of personal status and *waqf*, but the sacred law on all these subjects has been more or less deeply modified by secular legislation in recent years. The personal laws of a number of non-Moslem communities, including subjects of Western countries, are officially recognized; these personal laws are applied by the religious courts of the several communities and by the consular courts respectively. For the rest of civil law, commercial law, and criminal

law, modern codes of French inspiration (with some slight regard for institutions of Mohammedan law) are applied by the national tribunals. In the slightly modified Egyptian Civil Code of 1948, the principles of the Shari'a are mentioned, together with custom and natural justice, as rules to follow in cases in which the code gives no explicit or implicit ruling.

Syria, Lebanon, Israel, Jordan, Iraq.—The laws of these countries show a certain family likeness, because parts of Ottoman legislation, though variously modified by later statutes, have survived in them. The *Mecelle*, in particular, is still the basis of civil law in these countries, with the exception of Lebanon (Code of Obligations and Contracts of 1932) and Syria (Civil Code of 1949). The Shari'a is everywhere applied to Moslems by cadis in matters of personal status and *waqf* (Hanafite law to the orthodox majority of Moslems, Shi'ite law to the Shi'ite minorities), though the law of *waqf* was modified by modernist legislation on the Egyptian model in Lebanon in 1947 and in Syria in 1949. The personal law applicable to Jews in Israel and to Jewish minorities elsewhere is rabbinical law.

Saudi Arabia.—As a result of the religious reform movement of the Wahhabis, Hanbalite law alone is valid in all branches of law, personal, civil, and criminal. Commercial law is ruled by a Commercial Code which is derived from the Ottoman Commercial Code but does not contemplate the possibility of giving and taking interest on money. The only commercial tribunal that applies this code sits in Jidda.

Yemen.—Here, too, Mohammedan law, in its Shi'ite Zaidi form, is alone valid in theory; in practice, however, it is tempered by the customary law of the tribes.

Iran (Persia).—Of the recent legislation, which was enacted mostly between 1926 and 1935, the penal law is inspired by Western models, the law of contracts, obligations, and inheritance closely follows the Shari'a but passes over in silence some antiquated dispositions (such as those referring to slavery), whereas the law of marriage introduces only few modifications of traditional Mohammedan law. The form of Mohammedan law valid in Iran is that of the so-called "Twelver" branch of the Shi'a. The ordinary jurisdiction is that of the secular tribunals; the cadis are competent in a restricted range of cases concerning marriage, divorce, and guardianship, and in those lawsuits which can be decided only by the formal rules of evidence of the Shari'a; but all these cases must first be referred to them by the secular courts. Cases concerning the personal status of non-Moslem minorities are subject to their own religious laws and tribunals; those of strangers are decided by the secular tribunals according to the laws of their home countries.

Pakistan.—As regards personal status and all other institutions sanctioned by religion, the Shari'a (in its Hanafite form for the great majority of Moslems, in its Shi'ite forms for the Shi'ite communities) has remained valid through the period of British rule. It was, and is, however, not administered by cadis but by British trained judges, and though most judges in the Moslem parts of British India were themselves Indian Moslems, English legal concepts and rules invaded the Shari'a to a considerable extent, and an independent variant of Mohammedan law, called Anglo-Mohammedan law, came into being.

The non-Moslem communities follow their own personal laws. The other branches of law are ruled by modern codes of British inspiration.

Greece.—The legislation of Greece is a modernized and simplified adaptation of Roman Byzantine law (essentially Justinian's *Corpus Juris Civilis* and the *Basilica* of Leo the Sage). There is no jurisdiction of orthodox ecclesiastical tribunals, but the remaining Moslems have retained their personal status under Hanafite law.

Turkey.—The Turkish Civil Code is based on a Swiss model, and the Penal Code on an Italian model; both date from 1926. In both fields, the Shari'a has been eliminated, but certain traces of it have inevitably remained in the legislation concerning *waqf*.

Oxford University.

21. THE ARTS: REACTION AGAINST HELLENISM. The conquest of Asia by Alexander the Great in the 4th century B.C. destroyed the political power of the Achaemenid Empire and introduced into Iran (Persia) and other parts of Asia the principle of Greek art. As a result of this Hellenistic influence, Iran and the rest of the Middle East developed a hybrid art. The various Seleucid satrapies became independent and developed provincial forms of Hellenistic art. One of these, the Graeco-Bactrian Empire of central Asia, was entirely under Hellenistic influence: its rulers were Greek and its population was to a great extent of Greek origin. This Hellenized Bactrian civilization, its art and coins, spread over central Asia and northern India. Although we find common features between the Hellenistic art of the West and that of the East, the latter soon developed forms which were peculiar to the East only. In the 1st century of the Christian era, the Hellenistic influence affected the Buddhist art of Gandhara and of Chinese Turkestan, creating a form of art known generally as Graeco-Buddhist.

Parthian Art.—In the middle of the 3d century B.C., eastern Iran was conquered by the Parthians, who became independent from the Seleucid Empire. The Parthian kingdom soon comprised not only all of Iran, but also Babylonia and Mesopotamia. Parthian art reveals a mixture of Hellenistic and Oriental elements. A reaction against Hellenistic thought and art began in the 1st century A.D. The Arsacids, the Parthian kings of Iran and Mesopotamia, felt themselves more and more as successors of the Achaemenids. On the coins they appear as true Iranians with long beards and national dress.

Art monuments of the Parthian period are not numerous. In Mesopotamia there are ruins at Assur, Erech (now Warka). Seleucia-Ctesiphon, Dura-Europos on the Euphrates, and the palace at Hatra (about the 2d century A.D.). The Hatra palace was an imposing structure, built in Oriental style with several large barrel-vaulted halls and arched doorways richly decorated with carved ornament. A door lintel, decorated with a pair of griffins, one of the finest examples of Parthian sculpture, is now in the Metropolitan Museum of Art. From Iran proper there are remains of rock sculptures of Mithridates II and Gotarzes II at Behistun (Bisutun), which show the Parthian style with very little Greek influence. Other Parthian ruins are at Istakhr, Kangawar, and Khurha.

Of great importance in the evolution of the

art of painting in Iran and in the whole Middle East are the Parthian ruins of the Kuh-i-Khwaja in Seistan (Sistan), the region where modern Iran, Afghanistan, and Baluchistan meet. These ruins, dating back to the 1st century A.D., consist of a palace and a temple. The walls of many rooms of the palace were decorated with monumental paintings, both figural and ornamental, which show both Hellenistic and Iranian styles, the latter a survival of the Achaemenid era.

Sassanian Art.—The reaction of the Oriental mind against Hellenism and the renaissance of neo-Iranian art continued under the rule of the Sassanian dynasty (226–641 A.D.) founded by Ardashir I. It was during this dynasty that Iran experienced one of the greatest periods of its history. Once more, as under the Achaemenid kings, Iran became a world power rivaling Rome and Byzantium. The Sassanian Empire comprised not only modern Iran but the Mesopotamian Valley as far south as the edge of the Arabian desert. The capital was Ctesiphon, not far from the modern city of Baghdad, where the great arch of the palace of the Sassanian kings is still standing. Under royal patronage arts and crafts flourished and the Sassanian epoch was one of the most brilliant periods of Iranian art.

The most complete manifestation of Sassanian art is found in the magnificent rock sculptures glorifying the Sassanian kings and depicting their triumphs over the Romans. Many of these rock carvings are still preserved in various parts of Iran but chiefly in the province of Fars. There was more than one style in Sassanian sculpture. In the 3d century the figures are rendered in high relief gradually changing into the lowest relief. Fluttering drapery and use of different planes are features derived from Hellenistic art. In the 4th century the style of sculpture changes, as in the two reliefs of Ardashir II and Shapur II at Taq-i-Bustan near Kermanshah. The high and round relief is replaced by a flat plane and the figures are only lightly modeled. These forms were no doubt strongly influenced by contemporary painting which replaced the Hellenistic sculpture. At the same time, the sculptors of Sassanian rock reliefs revived many artistic conventions used in the Achaemenid era of Persian art. As in the reliefs of the palaces of the Achaemenid kings at Persepolis, symmetry and rhythmic repetition are important artistic principles. The pictorial character of Sassanian sculpture is best known from two great hunting reliefs in the grotto at Taq-i-Bustan, which date from the time of Khosrau II Parvez (r. 590–628 A.D.). Such hunting scenes were derived from ancient Oriental art and are known to us chiefly from Assyrian sculpture.

The Sassanian style of the rock sculptures is also apparent in a number of silver dishes decorated with figure subjects, mostly royal hunting scenes. These silver vessels, most of which are in The Hermitage in Leningrad, are among the finest products of Oriental metalwork. They belong to several periods and represent Sassanian kings, who can be identified from their distinctive crowns. In hunting scenes, which are miniature reproductions of Sassanian paintings and sculpture, the king, mostly on horseback and dressed in rich garments, is glorified as the supreme hunter. The crescent and the celestial globe surmounting the crown symbolize the divinity of the king. Two important silver dishes with hunting scenes are in American collections. In the Freer

Gallery in Washington, D.C., is a dish representing Shapur II (r. 309–379 A.D.) hunting wild boars. Another silver dish in the Metropolitan Museum of Art, New York City, dates from a century later and represents Firuz or Peroz II (r. 457–484 A.D.) hunting ibexes. In spite of a certain approach to realism in the rendering of human figures and animals, several Oriental artistic conventions are apparent. Contrary to the naturalistic principle of Hellenistic art, and ignoring all the rules of perspective, the scenes are represented simultaneously from several points of view.

Sassanian art must be credited with the creation of a new style of abstract, pseudo-floral ornament based on traditions of Oriental art. As in Assyrian, Babylonian, and Achaemenid art, the palmette became the integral motif of Sassanian ornament, best known to us from stone and stucco carvings. Excavations at Ctesiphon and Kish in Mesopotamia, and Damghan in Persia brought to light a rich stucco decoration of palaces and private houses. Many stucco panels from Ctesiphon, excavated by the German State Museum and the Metropolitan Museum, are now in the Metropolitan Museum of Art. Palmettes of various types are combined into ornamental devices forming an all-over pattern. Some of the abstract palmettes created by Sassanian artists are quite elaborate, being composed of several elements. Such composite palmettes continued to be used by Persian artists for centuries and later appear in 16th and 17th century rugs.

Iranians of the Sassanian era held the monopoly of the silk trade between China and the West and early established their own looms for the manufacture of silk stuffs, which soon became famous all over the East and also in the West. At Shushtar, Susa, and Gundeshapur various types of fine silk fabrics were woven, both for home consumption and for export. The Sassanid weavers created a new style of silk decoration which influenced the medieval silk weaving of Syria, Egypt, Byzantium, and even of the West. A typical Sassanian silk pattern shows large circular medallions with hunting scenes, animals, and birds separated by palmette devices.

Islamic Art.—The reaction against Hellenism and the rise of the Oriental spirit in thought and creative art did not stop in the Sassanian era but continued under Islam, a religion founded by the Prophet Mohammed, born in the Arabian town of Mecca. The Moslem or Mohammedan era began in 622, the year of Mohammed's flight (hegira) from Mecca to Medina. The Arab armies of the caliphs conquered Syria, Palestine, Mesopotamia, Egypt, North Africa, and Iran. In the time of Mohammed the Arabs, having little or no art of their own, adopted the highly developed culture and art of the conquered countries. The caliphs of the Ommyad (Umayyad, 661–750) and Abbasid (750–1258) dynasties requisitioned not only materials but also craftsmen from all the provinces for the construction of new cities, palaces, and mosques. Byzantine and Syrian mosaicists were employed to decorate the great mosque at Damascus, where the chief architect was an Iranian. Christian Copts worked in Jerusalem, Damascus, and Mecca. Coptic weavers were liberally employed in the state manufactories established in Egypt.

An Islamic style was derived chiefly from two artistic sources, the East Christian and the Sassanian. Coptic influence on Islamic art of Egypt

continued for several centuries and is evident as late as the 11th century. From the Christian art of Syria the Moslem artists borrowed the Greek acanthus and the vine ornament, but rendered them in a purely decorative fashion only remotely related to the Hellenistic prototype.

The Sassanian style did not end in 641 A.D. with the conquest of Iran by the Arabs, but continued for several centuries. It had a great influence on the formation of Islamic art. In a number of early Islamic monuments we find East Hellenistic and Sassanian motives and styles side by side. The most important early Islamic building is the famous stone façade of the 8th century palace at Mshatta, in the Syrian desert, now in the German State Museum in Berlin. Here one part of the carved decoration (at the left of the entrance gate), of vine scrolls and acanthus with animals and birds, is derived from Hellenistic and East Christian art of Syria. In the other part of the decoration (at the right of the gate) there are no representations of living beings and the ornament is treated in abstract fashion based on artistic traditions of Sassanian Iran. At the same time there is evidence in Mshatta and other early Ommyad monuments of a birth of a new Islamic style.

The evolution of the Islamic style continued under the Abbasids. The intense artistic activity of the Abbasid period is closely connected with the rise of Baghdad, which became a center of Islamic culture and art. At the courts of the Abbasids the Iranian influence was predominant. Evidence of this influence is apparent in the Abbasid decoration and the art of painting. In the 9th century wall paintings of the palace of Samarra, the temporary residence of the caliphs, the figure subjects and the ornament are based on the traditions of Sassanian painting. Stone and stucco decoration of the Abbasids shows the beginnings of the arabesque, a purely abstract ornament which in its fully developed form appears not before the 11th century. Another characteristic of Islamic art, which must be regarded as an invention of Moslem artists, is the decorative use of Arabic writing, at first in its angular or Kufic form, later in the round or Naskhi characters.

While the caliphate was losing its political and spiritual importance, the Seljuks, a Turkish tribe of central Asia, conquered the Iranian province of Khurasan in 1037 and marched westward. They crushed every dynasty in Persia, Mesopotamia, Syria, and Asia Minor and injected new life into the dying Arabic empire (11th, 12th, and 13th centuries). The Seljuks and their followers, the atabeg rulers, were great patrons of art. At their courts at Merv (now Mary), Herat, Rhages (Rai; Rayy), Mosul, Amida (Diyarbakr), and Konya (Konia) gathered famous calligraphers, painters, potters, metalworkers, jewelers, and architects. The most popular ornament of the Seljuk period was the arabesque which was extensively used for the exterior and interior decoration of buildings, prayer niches (mihrabs), and tombstones. The arabesque is composed of curving scrolls, crossed or interlaced, bearing several types of palmettes (full palmettes and half palmettes). There is no beginning or end to the arabesque design. Together with the arabesques, Kufic writing was extensively used in Seljuk decoration. Writing became now an essential part of Islamic art. Calligraphy flourished and magnificent Korans, on

parchment and later on paper, were prepared for the Moslem rulers.

Under the Seljuks the potters of Persia and Mesopotamia created magnificent ceramic ware, which must be classified among the most beautiful ever produced. The Persian potters of Rhages, Kashan, and other centers during the 12th and 13th centuries perfected many ceramic techniques such as luster decoration, monochrome and polychrome painting, and openwork.

Seljuk metalworkers developed and perfected the technique of inlaying objects of bronze and brass with copper and silver. The beginnings of this technique can be localized in the province of Khurasan in eastern Iran. The inlay style created by 11th century Seljuk metalworkers of Herat, Nishapur, Merv, and Seistan, was adopted by the whole Middle and Near East. By the 13th century, Mosul, a city in northern Mesopotamia and the capital of the Seljuk Zangids, became a great center of inlaid metalwork. Mosul metalworkers frequently migrated to Syria and Egypt and introduced the Seljuk style in Damascus, Aleppo, and Cairo.

The Seljuk period was of great importance in the history of Islamic painting. Books on medicine like the *Materia Medica* of Dioscorides Pedanius, al-Hariri's *Maqāmāt*, or *Assemblies*, and al-Jazari's *Automata* or *Treatise on Inventions* were richly illustrated by 13th century artists of the Baghdad school, and also at the Seljuk courts of Amida and Mosul. These painters evolved a style of miniature painting which was followed by Persian artists for several centuries. Many conventions, including rich color schemes, known from Persian paintings of the 14th and 15th centuries, were already used by Mesopotamian artists.

All the characteristic features of Islamic art were fully developed in the Seljuk era. Islamic art is a composite art. It did not originate in any one country. The Arabs, Persians, and Turks, bound together by a single faith, contributed equally to the formation of the Moslem art. The Islamic art of all periods was essentially a decorative art. To the Moslems an empty space was intolerable. Every inch of available space was decorated according to artistic principles developed by Moslem artists. Walls of buildings and objects of daily use were covered with ornament or figure subjects rendered two-dimensionally without any indication of roundness or perspective. See also MOHAMMEDAN ART; PERSIAN ART.

22. AMERICAN ARCHAEOLOGY IN THE NEAR AND MIDDLE EAST.

American archaeological work in the Near and Middle East areas began late in the 19th century and has been continued on a wide scale since that time. In some lands schools have been established under whose auspices much, if not all, of the excavation is done. However, in most areas individual institutions—universities or museums—play a large part in the work; in some instances joint international enterprises have been organized. The major American archaeological achievements in the Near and Middle East are here summarized.

Greece.—American archaeological work in Greece is sponsored by the American School of Classical Studies in Athens. Founded in 1881, the school promptly began a program of systematic collecting and publishing of inscriptional material. The earliest excavation was that of the sanctuary of Hera near Argos, which was investigated from 1892-1895, with another campaign in 1925. The early temple, almost completely destroyed, probably dated to the late 7th century B.C., but the one whose remains are visible dates from the late 5th century. However, settlement on the site long antedated the foundation of the temple; there seems to have been a flourishing village all through the Bronze Age (called the Helladic Age in Greece), and traces of Neolithic settlement have been found.

In 1896 work began at Corinth in the Peloponnesus and has continued since that time. Most of the work has been devoted to the excavation of public buildings of the Roman period, which are the most conspicuous monuments. However, the walls of the classical Greek city have been established, as well as various buildings of Greek date, including the theater, structures in the marketplace, and the foundation of the Temple of Apollo. Remains of pottery and other objects in the debris indicate that settlement on the site goes back to Early Helladic times. Further excavations were made at several sites in the vicinity of Corinth, which yielded material covering the entire range of the Helladic Age. In 1930 excavations were begun on the north slope of the Athenian Acropolis, and the following year in the Agora (marketplace); the Athenian projects are expected to be of long duration, and the careful investigations are gradually unraveling the complex history of Greece's greatest city. Many Roman and Byzantine buildings have been found, and it is known that settlement began as early as the 2d millennium B.C. (Middle Helladic period). The Agora assumed a monumental character in the 6th century B.C., and its greatest building activity was in the 5th century. One of the most important results of this excavation is the opportunity afforded to identify buildings mentioned by classical writers with the actual remains.

Shorter and more recent are the excavations of the School at Olynthus in Macedonia from 1928-1938. Although remains of the Neolithic period, early in the 3d millennium B.C., have been found, the city as a whole dates from the late 5th century to 348 B.C., when it was destroyed by Philip of Macedon. Here we are fortunate in having a picture of the complete town with private houses, public buildings, and a cemetery, the whole complex yielding a wealth of objects of the classical period.

Egypt.—The earliest American work in Egypt, under the auspices of the University of

California, began in 1899 and consisted of surveys and digging in southern Egypt in both town sites and cemeteries. Three years later the expedition commenced what proved to be over a generation's work at Giza, site of the Great Pyramids, which are the nucleus of a large Old Kingdom cemetery. The enterprise was taken over by Harvard University and the Boston Museum of Fine Arts in 1905 and continued until 1939. This careful investigation has given us a detailed picture of the development of tombs and has yielded a large number of fine works of art. The Metropolitan Museum of New York began working in Egypt in 1906 and pursued various investigations until 1931. Perhaps most valuable of its tasks has been the copying and publishing of the pictures and inscriptions in many Empire period tombs at Thebes. The Temple of Queen Hatshepsut at Deir el-Bahri was investigated, as were also the temples of 11th dynasty kings at the same site, a Persian period temple in northern Egypt, and a group of monasteries founded in early Christian times. One of the last yielded a large series of texts, including apocryphal Gospels and other religious documents. The Oriental Institute of the University of Chicago instituted a series of large-scale works in 1924, devoted chiefly to the copying of reliefs and inscriptions from several temples of the Theban area, and a survey of the Nile River valley to determine its geological origin and the dates of the traces of prehistoric men found in its terraces. Between 1924 and 1931 the University of Michigan excavated two town sites of the Roman period, giving us for the first time some knowledge of the domestic life of that era in Egypt.

Palestine and Transjordan.—In Palestine, American archaeological work began in 1838 with the topographical survey and surface exploration of Edward Robinson, who succeeded in identifying scores of ruin mounds with their Biblical names. Much 19th century work was done jointly with the British, especially in the city of Jerusalem. The year 1900 saw the founding of the American School of Oriental Research in Jerusalem, which has sponsored numerous excavations and has been a training school for Palestinian archaeologists in general. In 1908, Harvard University began excavating at Samaria; after three campaigns the site was abandoned until 1931, when for four years an American-British expedition dug there. This work gave a good picture of a city in the time of the Israelite monarchy and in the Hellenistic period. From 1921 to 1933 the University Museum of the University of Pennsylvania dug at Beth-Shan (Bethshean; now Beisan), which revealed a sequence of cultural levels beginning in the 4th millennium B.C., as well as a fine series of forts of the Egyptian garrison dating from the 14th to the 12th centuries B.C. From 1925 to 1939 the Oriental Institute carried on intensive excavations at Megiddo (the Armageddon of *Revelation*), in which the entire Late Iron Age city and substantial parts of the earlier Iron Age and Late Bronze Age levels were uncovered; among other notable buildings, a group of stables, which may have been the Stables of Solomon, were found. Remains of earlier cities on the Megiddo mound were found in small areas, and settlement clearly began well back in the 4th millennium and continued without noticeable break into Hellenistic times.

In 1926 the American School in Jerusalem

began the excavation of Tell Beit Mirsim, and in six campaigns of meticulous work provided the basis of our knowledge of Palestinian culture from the Middle Bronze to the Late Iron ages (c.2000–500 B.C.). An excavation by the school at Tell en-Nasbeh (perhaps Biblical Mizpah), beginning in the same year, revealed an Israelite period city; and a contemporaneous city, Beth-Shemesh, was excavated by the school from 1928 to 1933. Finally the school was also responsible for the systematic survey of the Transjordan carried on from 1933–1943, during which ancient sites over the whole area were recorded and approximately dated by the types of pottery found on the surface.

An important American-British expedition dug at the great city of Gerasa (now Jerash) in Transjordan from 1925 to 1934. Most of the remains are of Roman times and include a majestic colonnaded street bisecting the city, monumental gateways, temples to pagan gods, Christian churches, and various other public buildings. Excavations of Palestinian caves to find and record the traces of Stone Age man were undertaken from 1928 to 1934 by another joint American-British expedition, and yielded skeletal remains of early types of human, as well as the tools which they had used.

Syria.—The earliest American work in Syria was an extensive survey in 1899–1900 by the American Archaeological Expedition, continued by Princeton University in 1904–1905 and 1909. The expedition concerned itself chiefly with standing architectural monuments, providing accurate drawings of buildings, mainly of Roman and early Christian date, plus some Nabataean and a few Hellenistic buildings. Princeton also sponsored excavations from 1932–1939 in Antioch-on-the-Orontes (now Antakya, Turkey), chief city of Roman Syria. Probably the most significant finds are an excellent series of mosaic floors, often depicting mythological scenes and constructed with great skill. In 1928, Yale University joined the French Academy in the excavation of Dura-Europos, a fortress on the Euphrates River which was founded in Hellenistic times, but whose remains come chiefly from the period when it was a Roman garrison post. Ten seasons of excavations have revealed the block plan of the city, as well as the course of the city walls, the marketplace, blocks of private houses, large mansions of officials, army barracks, and public baths. The chief interest of the city is probably in its many religious edifices, which include temples to various pagan gods, a synagogue with elaborately painted walls, and a Christian chapel. The Oriental Institute of Chicago began to dig at several sites near Antioch in 1932. The excavations yielded no great cities, but their importance lies in the fact that they provide a well documented sequence of Syrian cultures from the Chalcolithic Age (4th millennium or before) to Roman times.

Turkey.—The Oriental Institute also undertook the excavation in Turkey of an Anatolian city, Alishar, in the central plateau, from 1927 to 1932. Again the greatest significance lies in the dated building levels and the sequence of objects which they contain, ranging from Chalcolithic to Byzantine times. In 1932 the University of Cincinnati began excavations at Troy on the northwestern tip of the Anatolian Peninsula. Concentrating on small areas left untouched by the 19th century excavations there, the ex-

pedition in six campaigns has unraveled the very complex stratigraphy of superimposed cities from around 3000 B.C. to the Roman period and has established with certainty which city was the Troy celebrated by Homer. An expedition sponsored by Bryn Mawr College and other institutions worked at Tarsus in southeastern Anatolia intermittently from 1934 to 1949. The major remains are Hellenistic-Roman, but investigations in the earlier levels of the city revealed that it was inhabited as early as the Neolithic Age.

Iraq.—In Iraq, ancient Mesopotamia, the first American excavation was at Nippur in southern Babylonia from 1889 to 1900 under the auspices of the American Oriental Society and other institutions; in 1948 work was begun again by the University Museum of the University of Pennsylvania and the Oriental Institute. The site contains material dating from around 2000 B.C. to the early Christian era. The large number of clay tablets inscribed in the Babylonian cuneiform writing are the most valuable finds, but the building remains, especially the Temple of Enlil, are also notable. From 1922 to 1934 a joint expedition of the University Museum and the British Museum dug at Ur of the Chaldees, famed as the original home of Abraham, a site whose remains range from early prehistoric times down to the period of Hellenistic rule. Most important are the zigurat, or stepped temple-tower, first built before 2000 B.C. and remarkably well preserved, and the 3d millennium cemetery containing the "royal tombs," whose treasures rival those of Tutankhamen in both value and scientific interest. From 1923 to 1933 the Field Museum of Chicago joined with Oxford University in digging the city of Kish near Baghdad, first settled in prehistoric times and apparently remaining important well down into the Christian era. In 1925 an expedition sponsored by several institutions began work at Nuzi near Kirkuk. The city of the 2d millennium B.C. was laid bare and offers a good example of a complete town plan, with many private houses, a large palace, and its associated temple. The 3d millennium city beneath it was partially revealed, and pits dug into earlier levels show that settlement began in prehistoric days. Numerous cuneiform tablets are yielding much information regarding domestic and international affairs around 1500 B.C. Seleucia-on-the-Tigris, just north of Baghdad, was investigated in several campaigns between 1927 and 1937, and shows a city of the Hellenistic period and the time around the dawn of the Christian era. From 1928 to 1935 the Oriental Institute worked near Mosul in the palace of King Sargon II at Khorsabad, trying to complete work begun in the 19th century on this unfinished capital city of the Assyrian Empire. From 1929 to 1938 excavations were pursued by the Oriental Institute and other institutions in four sites on the Diyala River in central Mesopotamia. Together they have yielded material from prehistoric and early historic times down to around 1800 B.C.: public buildings, private houses, fortification walls, cemeteries, and a wealth of objects. The University Museum and the American School in Baghdad worked at two sites near Mosul from 1930 to 1938. Tell Billa was excavated only in part, and showed levels dating from the early 3d millennium to the Persian period. Tepe

Gawra was quite thoroughly examined; its settlement apparently began in Neolithic times and lasted until about 1500 B.C. The layout of the major part of the 3d millennium town is known, and the dating of the many superimposed layers of the late prehistoric period has been carefully worked out and forms a basis for comparative chronological work in the area.

Iran.—The site of the major American excavations in Iran, ancient Persia, is Persepolis, the capital city of the Achaemenid kings, which was burned by Alexander the Great; here the Oriental Institute worked from 1931 to 1937. The great terrace which held the palaces, audience halls, and other public buildings has been largely excavated, and we have not only the building remains, but a wealth of relief sculpture which ornamented them. A small village near the city was investigated by the same expedition and proved to contain remains of a very early prehistoric settlement, notably some very beautiful painted pottery. From 1931-1933 the University Museum of Pennsylvania dug at Tepe Hissar in the Iranian plateau, revealing levels of prehistoric and early historic date with numerous houses and graves, and also remains dating from the Christian era. See also ORIENTAL ARCHAEOLOGY (NEAR EAST).

Yale University.

MIDDLE ENGLISH, a term now usually designating the epoch in the development of the English language intermediate between Anglo-Saxon or Old English and Modern—from about 100 to 1500 A.D. It was characterized by leveling and loss of inflection, by much diversity or orthography, and most importantly, by the French influence. See also ENGLISH LANGUAGE.

MIDDLE EUROPE, in German, **MITTEL-EUROPA**, is the name applied to one of the alleged policies that were to be pursued by Germany in the process of carrying out the Pan-German program of "World Empire or Downfall." Briefly stated, the scheme consisted of absorbing a number of European states into a German confederation either by treaty agreements or conquest. Thus, Norway and Sweden were to be absorbed; Holland with her colonial possessions was to become an ally of Germany; in order to establish Germany's position as a naval power, naval stations would be necessary at Dover and Malta; the western portion of Russia down to the Black Sea was to be conquered; according to Friedrich von Bernhardi, Denmark was "of great military importance to us"; the command of the Straits leading to the Baltic would be imperative for operations against England; according to some exponents, Holland, Belgium, Luxembourg and Switzerland were to be annexed and all foreign influence eliminated; while Livonia, Trieste, Venice and the north of France from the Somme to the Loire were to be included. Germany, Austria-Hungary and Italy were to be firmly united by an economic union. The items represent the Mittel-Europa plan, beyond which lay other necessary acquisitions, such as Egypt, central Africa, Asia Minor, India and sundry South

American republics. See also PAN-GERMANISM.

MIDDLE TEMPLE. See INNS OF COURT; TEMPLE (London).

MIDDLEBORO (officially MIDDLEBOROUGH), unincorporated village, Massachusetts, situated in Plymouth County, at an altitude of 110 feet, 35 miles south of Boston, on the New York, New Haven and Hartford Railroad. It is in a cranberry-growing area. Manufactures of importance are shoes, hospital supplies, varnishes, fire apparatus, brass products, plastics, and caskets. The village has a high school and a public library.

Middleboro forms part of the town of Middleboro, settled in 1660 and incorporated in 1669. One of the oldest towns in the county, it was called Nemasket by the Indians, who were friendly toward the townspeople until the outbreak of King Philip's War in 1675. Burned by the Indians it was soon rebuilt. An excellent supply of waterpower favored the growth of industries in the 19th century. Pop. (1950) 5,889.

MIDDLEBURY, town, Connecticut, situated in New Haven County, six miles west-southwest of Waterbury. The town is largely residential but has some dairy farms and a plant manufacturing watches and clocks. To the west is Quassapaug Pond. In the town are the West-over School for Girls and the Chauncey Judd House, scene of an incident in the American Revolution. Middlebury was settled early in the 18th century and incorporated in 1807 on land taken from Waterbury, Woodbury, and Southbury. Pop. (1950) 3,318.

MIDDLEBURY, village, Vermont, seat of Addison County, on the Rutland Railway, 33 miles north-northwest of Rutland. Located in the town of Middlebury at an altitude of 365 feet on both sides of Otter Creek and under the shelter of Chipman Hill, it is a noted cultural center, the seat of Middlebury College and the Women's College of Middlebury (q.v.).

Among its historic buildings are the Wainwright House (1807), the Congregational Church (1806-1809), the Community House (1816) and the Sheldon Art Museum (1829). The village is also the center of a winter and summer resort region.

Midway between Salisbury and New Haven, Vt., Middlebury received its name and charter in 1761 as one of the New Hampshire Grants (q.v.). By edict of George III, it became part of New York in 1764, and for some 20 years its town meetings were held in Salisbury, Conn., home of most of the early proprietors. The first land was cleared in 1766, with settlements undertaken in 1773 and 1778 and renewed, after Indian Tory raids, in 1783. The town was organized in the independent state of Vermont in 1786, and the village was incorporated in 1832. Middlebury College was founded here in 1800. In 1807, Emma Hart (later Emma Willard) of Connecticut, author of *Rocked in the Cradle of the Deep*, began here a pioneer project for women's education; in 1814 she opened the Middlebury Female Seminary as a private institution to demonstrate the capacity of women to master subjects studied by men.

Early industrial developments at Middlebury include the discovery (1799) of a practical method

of welding cast steel; development of the use of sand, water, and toothless saws in quarrying marble, and the invention of the first machine for manufacturing doors and window sashes. Paper, cotton, woolen, and lumber mills were established in the 19th century. Dairying, poultry raising, and fruit growing are the chief farming activities. Pop. (1950) 3,614.

MIDDLEBURY COLLEGE AND THE WOMEN'S COLLEGE OF MIDDLEBURY

, an accredited, private, nonsectarian institution of higher learning in Middlebury, Vt., chartered by the state legislature on Nov. 1, 1800. The founders were prominent citizens of Vermont, several of whom lived in Middlebury and adjacent towns. They were counseled by President Timothy Dwight (q.v.) of Yale College. The oldest college in the state in point of service, Middlebury was opened on Nov. 5, 1800, and graduated its first class in 1802, at which time the first academic degrees conferred in Vermont were bestowed. Its first building was shared with the Addison County Grammar School, and it was 1815 before the college acquired its first permanent structure, Painter Hall. Its growth was interrupted by the Civil War, but was steady thereafter. Women were admitted in 1883; in 1931 a separate women's college was established. Middlebury was a pioneer in the direct method of teaching foreign languages. The Château, built in 1925, houses the French school, and there are schools of other modern languages. At nearby Bread Loaf there is a school of English and a writers' conference is held annually. The degrees of B.A. and M.A. are offered, as well as a doctorate in modern languages and a B.S. degree for courses taken in cooperation with the Massachusetts Institute of Technology. The main campus covers 250 acres, and there is a mountain campus of 13,000 acres. The library has a fine French collection. The average yearly enrollment is 1,200.

MIDDLEMARCH (in full MIDDLEMARCH, A STUDY OF PROVINCIAL LIFE), a novel by George Eliot (q.v.), first published in 1871-1872. To many critics, *Middlemarch* is the greatest novel George Eliot ever wrote. Its scope, its variety, its maturity and insight are indubitable. Yet to others it lacks something of the charm and spontaneity of the author's earlier works, and its very inclusiveness and scope lead to a certain confusion of plan and blurring of outline that mark it as artistically imperfect. Whichever view is correct, the novel is admittedly great. Written late in George Eliot's career, it is at once weighty with her considered evaluation of the essential factors in life and rich in her observation and experience of human nature. The plot is the most involved of any that the author presented, and the characters are numerous even for a Victorian three-decker. In general there are two main groups of characters, not, it must be confessed, as closely interrelated as artistically they should be. Dorothea Brooke may be regarded as the center of one group, and Dr. Lydgate of the other. Both represent the tragedy of high aims that fail to take fully into account the actualities of life. Dorothea sentimentally pines to be the helpmate of a genius; but as the wife of the Rev. Edward Casaubon, who is writing a *Key to All Mythologies*, she is disillusioned and her misery is ended only by the

death of her husband. Dr. Lydgate comes to Middlemarch with excellent training, determined to push forward in biological research. However, he marries the attractive but unpractical Rosamond Vincy, is overwhelmed in debts, and his possible career fades into nothingness. But George Eliot's view of life is not distortedly pessimistic. Over against the somber recognition of the inadequacies and weaknesses of humanity must be placed her portrayal of the fine and strong elements. Dorothea herself is genuine and charming fundamentally; the Garths are sterling, and full of vitality. For all its wavering and crowded plot, *Middlemarch* is permanently valuable because it represents a realism that endeavors to reflect in just proportions the good and bad in life; a realism, moreover, that does not content itself merely with presenting life, but does not shrink from the task of interpretation and evaluation.

MIDDLEPORT, village, Ohio, situated in Meigs County, at an altitude of 565 feet, on the Ohio River, 51 miles southwest of Marietta. It has freight service via the Chesapeake & Ohio and the New York Central railroads. There are coal mines and gas and oil wells in the vicinity, and the village has railroad shops and plants processing food and manufacturing cement blocks. After a disastrous flood in 1937, Middleport was moved back from the river front. Pop. (1950) 3,446.

MIDDLESBOROUGH or **MIDDLESBORO**, city, Kentucky, situated in Bell County, at an altitude of 1,135 feet, near Cumberland Gap, 110 miles southeast of Lexington. It is served by the Louisville & Nashville and the Southern railroads. In a coal and iron mining region, it produces mining equipment, foundry and machine shop products, leather, elastic webbing, coke, wood products, and overalls. Just south of the city is Fern Lake, and nearby are the ruins of Fort Lyon. Middlesborough was founded in 1889 by English interests and named for the English town of Middlesborough. Incorporated as a city in 1892, it is governed by a commission and owns its airport. Pop. (1950) 14,482.

MIDDLESBROUGH, mĭd'ľz-brŭ, county borough, England, situated in the North Riding of Yorkshire, on the south bank of the Tees River, 34 miles south of Newcastle. It dates from 1829-1830, with the development of the coal and iron mines of the neighboring Cleveland Hills and Durham fields. It is distinguished for its municipal enterprises; it has handsome public buildings, including a fine Roman Catholic cathedral; and extensive and commodious docks. Its chief industries are connected with iron manufactures. It has numerous blast furnaces and rolling mills, foundries, engineering works, potteries, chemical works, and shipyards; salt is extensively worked.

The borough was incorporated in 1853 and received a county charter in 1888. One member is returned to the House of Commons. The chief public utilities are municipally owned. Pop. (1951) 147,336.

MIDDLESEX, mĭd'ľ-sĕks, county, England, located in the Thames basin, adjoining London; bounded on the north by Hertfordshire, on the south by Surrey, on the east by Essex and London, and on the west by Buckinghamshire.

The chief towns are Brentford (the capital) and Chiswick, Willesden, Uxbridge, Ealing, Hornsey, Harrow, Tottenham, and Hampton. The county is drained by the Thames, Colne, and Lea rivers. It is chiefly residential, with market gardening. The area is 232 square miles.

Middlesex, so named because it was between the east and the west Saxons, is one of the older English counties. Pop. (1951) 2,268,776.

MIDDLETON, mĭd'ľ-tŭn, **Arthur**, American colonist: b. Charleston, South Carolina, 1681; d. Sept. 7, 1737. He was conspicuously engaged in public affairs as a member of the council as early as 1712; and exerted his political influence in favor of popular claims, opposing the lords proprietors, and finally heading the revolution which threw off the whole proprietary government and placed the colony under the immediate protection of the Crown (1719). In 1725 he succeeded Gen. Francis Nicholson as acting governor of the colony, which office he held till 1731, when the royal governor arrived; he then retained his position in the governor's council. His administration as governor was partly occupied by war and negotiations with the Spaniards of Florida and the French of Louisiana.

MIDDLETON, **Arthur**, American patriot, signer of the Declaration of Independence: b. Middleton Place, near Charleston, South Carolina, June 26, 1742; d. Goose Creek, South Carolina, Jan. 1, 1787. He was educated in England at the University of Cambridge, then returned to South Carolina for a time and was a member of the legislature, but went abroad again for two years' travel on the Continent. On his final return to America, he established himself as a planter, and soon became one of the leaders of the Revolutionary party. He was one of the most efficient members of the first council of safety, and in 1775 was sent to the Provincial Congress. In 1776 he was sent as a delegate of the state to the Continental Congress, and as such affixed his signature to the Declaration of Independence. He held his seat in Congress until 1777, declined the governorship of South Carolina in 1778, and took the field for the defense of Charleston in 1779. His plantation was devastated by the British and he was made a prisoner after the fall of Charleston in 1780, and was one of the leading citizens who were kept in confinement as hostages. His estate was sequestered, and he was shipped to the castle of St. Augustine, and thence transferred to the Jersey prison ship. Exchanged in the latter part of 1780, he served until the close of the war as a delegate in the Continental Congress, and was afterward elected to the state senate. He was a skillful stenographer, and reported many of the debates in which he participated.

MIDDLETON, **Conyers**, English divine: b. York, or Richmond, Yorkshire, Dec. 27, 1683; d. Hildersham, near Cambridge, July 28, 1750. He was educated at Cambridge and was elected a fellow there in 1706. He married soon afterward, thus losing his fellowship, and for a short time was rector of Coveney in the Isle of Ely, a rectory in the gift of his wealthy wife. He received his D.D. at Cambridge in 1717. He was appointed university librarian in 1721, and was in Italy in 1724-1725. His *Letter from Rome* (1729) dealt at some length upon the adaptation

of pagan beliefs and ceremonies in the Roman Catholic Church and was highly praised by the orthodox English clergy, and occasioned great indignation among the Catholics. His controversy with Daniel Waterland, in which he urged the then heretical theory that theologians should not attempt to maintain the historical accuracy of the Bible in all instances, brought a storm of criticism and he was obliged to make some qualifications regarding his statements in order to retain his Cambridge degrees. He next engaged upon a life of Cicero, which to a great extent was related in the statesman's own words, and which gained a high reputation as a model of style, but was later found to be largely plagiarism from a rare book of William Bellenden's *De tribus luminibus Romanorum*. He then returned to the field of theological controversy, publishing his *Introductory Discourse* (1747), and his *Free Inquiry* (1748), attacking the miraculous powers supposed to have been inherent in the Church from early times. While this controversy was in progress Middleton died.

MIDDLETON, George, American playwright: b. Paterson, New Jersey, Oct. 27, 1880. After receiving his A.B. degree at Columbia University in 1902 he embarked on a literary career. The same year his first play, *The Cavalier*, written in collaboration with Paul Kester, was produced. Other successful play collaborations were *The Sinner*, with L. Westervelt (1907); *Hit-the-Trail-Holiday*, with George M. Cohan and Guy Bolton (1915); *Polly with a Past*, with Bolton (1917); *Accused*, with E. H. Southern (1925); and *The Big Pond*, with A. E. Thomas (1929). He was also sole author of several other plays including *Rosalind at the Gate* (1910) and *The Prodigal Judge* (1913).

In 1911 Middleton married Fola La Follette and the following year became literary editor of *La Follette's Weekly Magazine*. After serving as president of the Dramatists Guild of the Authors' League of America (1927-1929), he was for two years an associate producer of Fox Film Corporation. In 1942 he joined the staff of the Alien Property Custodian as copyright and trade expert.

MIDDLETON, Henry, American patriot, son of Arthur Middleton (1681-1737, q.v.): b. South Carolina, 1717; d. Charleston, South Carolina, June 13, 1784. He was elected to the South Carolina House of Commons and in 1745-1747 was its speaker. Appointed commissioner of Indian Affairs in 1755, he also served as a member of the council in 1755-1770. Elected a delegate to the Continental Congress in 1774, he was its president from October 1774 to May 1775. He was president of the Provincial Congress of South Carolina in 1775-1776. Re-elected to the Continental Congress in 1776, ill health obliged him to surrender his seat to his son Arthur (1742-1787, q.v.).

MIDDLETON, Henry, American politician and diplomat: b. London, England, Sept. 28, 1770; d. Charleston, South Carolina, June 14, 1846. Elected to the South Carolina legislature in 1801, he served until 1810, when he began a two-year term as governor of the state. A vigorous supporter of the war policy in 1812, he was elected to Congress in 1815 and served for four years. In 1820 he was appointed minister

to Russia, in which capacity he negotiated a treaty regulating trade and fisheries in the Pacific (1824). After his return to the United States in 1830 he retired from public life.

MIDDLETON, Thomas, English dramatist: b. probably in London, England, 1570?; d. Newington Butts, England, July 1627. Little is known of his life, but his writings testify to the excellence of his education before his entry at Gray's Inn in 1593 or 1596.

Several minor prose works preceded what seems to be his first play, *Old Law* (1599), written with William Rowley. From that time on he wrote constantly for the stage, now alone, now with Rowley, Philip Massinger, or Thomas Dekker. Among these works are several masques, of which the best and most dramatic is *The World Lost at Tennis* (1620). Middleton's *The Witch* (1778) is his best known work. His most successful play was *A Game at Chess* (1624), which satirized the wooing of the Spanish Infanta and was stopped by the Privy Council; it packed the playhouses because of its political and Protestant tone.

Among his other plays are *Michaelmas Terme* (1607), *A Trick to Catch the Old One* (1608), *The Roaring Girl* (1611), *The Spanish Gipsie* (1653), and *Women Beware Women* (1657).

His works were edited by Alexander Dyce, 5 vols. (1840), and by A. H. Bullen, 8 vols. (1885).

MIDDLETON, municipal borough, England, in Lancashire, 5 miles northeast of Manchester. Its industrial establishments include cotton and silk factories, dye and print works, ironworks, chemical works, and aircraft plants. Coal is extensively mined in the vicinity.

The Church of St. Leonard dates from the 12th to the 16th century; the grammar school was founded in 1572. Gas and electric lighting plants are municipally owned. Pop. (1951) 32,602.

MIDDLETOWN, city, Connecticut, Middlesex County seat, on the Connecticut River, altitude 50 feet, about 14 miles south of Hartford, on the New York, New Haven and Hartford Railroad, and modern highways.

The city is the business center of a rich agricultural region producing tobacco, fruits, and dairy products. Manufactures include metal products, elastic webbing, textiles, hardware, automobile parts, asbestos, chemicals, machinery, cigars, and rubber goods.

It is the seat of Wesleyan University (q.v.), founded in 1831. Two state institutions, Connecticut State Hospital for the insane, and Long Lane Farm, an industrial school for girls, are located here.

The town was settled in 1650 by colonists from Hartford and Wethersfield, and was incorporated in 1651 under its Indian name of Mattabeseck. In 1653 it was given the name Middletown because of its location midway between Hartford and Saybrook. A company recruited here by Col. Return Jonathan Meigs, at the outbreak of the Revolutionary War, fought at Bunker Hill and was cited for bravery by Washington. During the latter half of the 18th century it was one of the most prosperous towns in the state and is still a thriving industrial, commercial, and educational community. It was

once a port of entry and carried on a flourishing trade with the West Indies in lumber and farm products. Silver and lead were mined in the vicinity, gold was found there, and valuable deposits of freestone, feldspar, and columbite became commercially important.

Incorporated as a city in 1784, it obtained a new charter in 1882 providing for a mayor and council. The water supply is municipally owned. Pop. (1950) 29,711.

MIDDLETOWN, city, New York, in Orange County, on the Walkill River; altitude 559 feet; about 21 miles southwest of Newburgh on the Erie; New York, Ontario and Western; Middletown and New Jersey railroads; and state and federal highways.

It is the business and industrial center of a fertile agricultural region in the foothills of the beautiful Shawangunk Mountains, producing poultry, fruit and garden truck, onions, celery, and potatoes. The city has railroad shops, foundries, a tannery, and silk mills, and manufactures of saws, shirts, leather goods, footwear, underwear, wrapping and printing machinery, hats, handbags, and fur. The Orange County Community College was opened here in 1950.

The town was settled in 1796, and named as a halfway point on the Minisink trail from New York City to western New York. Incorporated as a village in 1848, it obtained a city charter in 1888. It has mayor and council, and municipally owned water supply. Pop. (1950) 22,586.

MIDDLETOWN, city, Ohio, in Butler County; altitude 666 feet; on the Great Miami River, about 33 miles north of Cincinnati; on the Baltimore and Ohio; Big Four; and Pennsylvania railroads; state and federal highways.

In the heart of the rich Miami Valley, it is the industrial center of a fertile agricultural region producing wheat, corn, hay, and oats. Manufactures include sheet and corrugated steel, paper, paper bags, boxes, and steel paper-making machinery.

The town was laid out in 1802 and named for its location midway between the mouth of the Great Miami River and its most northern navigable point. On one of Ohio's early canals, it was a shipping point for hogs during the mid-19th century. Later it turned to the manufacture of paper and tobacco. During World War I it grew in importance for the manufacture of steel.

Middletown was incorporated as a city in 1833, and adopted the commission type of municipal government in 1913. In 1949 the city charter was amended to provide for the commission-manager type of government. It has municipally owned water supply, and an airport. Pop. (1950) 33,695.

MIDDLETOWN, borough, Pennsylvania, in Dauphin County; altitude 355 feet; on the Susquehanna River; about 8 miles southeast of Harrisburg; on the Reading and the Pennsylvania railroads.

Founded in 1755 on the site of an Indian village, Middletown was incorporated in 1828. A market center for a farming region its principal local manufactures are infant's shoes, work clothing, boilers and stoves. A boat-building center during the Revolutionary War, it was one of the first towns in the United States to make steel. During the early 19th century it was a canal

shipping center. Nearby is Emaus Orphanage, founded in 1837, one of the oldest orphanages in the United States. St. Peter's Lutheran Church was built here in 1767. Olmsted Air Force Base is located here. Pop. (1950) 9,184.

MIDDLETOWN, town, Rhode Island, in Newport County, 5 miles north of Newport, on Narragansett Bay. It is on the New York, New Haven, and Hartford Railroad (for freight only), and on state highways. Predominantly agricultural, it is also a resort town. St. George's School, a private boys' school, is located here. The town was incorporated in 1743; government is by town meeting. Pop. (1950) 7,382.

MIDEWIN, mī-dā'wēn, or **MIDEWIN**, mī-dā'wē-wēn, or **MIDE**, mē'dē, or **MEDA SOCIETY**, a secret religious organization of the Ojibway Indians and neighboring tribes. The aim of the society was to prolong life by the use of herbs and magic.

MIDGARD, mīd'gārd, in Scandinavian mythology, the dwelling place of the human race, formed from the eyebrows of Ymir, one of the first giants, and joined to Asgard, the abode of the gods, by the rainbow bridge.

MIDGE. See GNAT.

MIDGLEY, mīj'li, **Thomas, Jr.**, American research chemist: b. Beaver Falls, Pennsylvania, May 18, 1889; d. near Columbus, Ohio, Nov. 2, 1944. He was educated at Cornell University, and received his M.E. in 1911. From 1912 to 1914 he did research work on automobile tires, and from 1914 to 1916 he was superintendent of the Midgley Tire and Rubber Company of Lancaster, Ohio. He worked with Charles F. Kettering and the General Motors Research Corporation until 1923 when he was appointed vice president of the Ethyl Corporation, a position he retained until his death. He was a vice president of Kinetics Chemical, Inc. from 1930, and director of Ethyl-Dow Chemical Company from 1933. From 1940 he was vice president of the Ohio State University Research Foundation, and vice chairman of the National Inventors Council.

His most noteworthy contribution to science was the discovery of tetraethyl lead as a gasoline anti-knock compound; also certain organic fluoride compounds for refrigerants which are nonflammable and nontoxic.

He was awarded the Nichols Medal of the American Chemical Society in 1923, the Perkins Medal in 1937, the Longstreth Medal of the Franklin Institute in 1925, the Priestly Medal of the American Chemical Society in 1941, and the Willard Gibbs Medal in 1942.

MIDHAT PASHA, mīd-hāt'pā-shā', Turkish statesman: b. Constantinople, 1822; d. Arabia, May 8, 1884. He entered the Turkish government service, was made pasha in 1860, was governor successively of Uskup, Bulgaria and Salonica, and distinguished himself by his wise administration. In 1873 he was for a short time grand vizier. He aided in deposing the sultans Abdul-Aziz and Murad V in 1876, was grand vizier under Abdul-Hamid (Dec. 1876-Feb. 1877), and was then banished by the suspicious monarch. Later, however, he was governor of Smyrna, then of Syria. He was tried with other pashas

for the murder of Abdul-Aziz, was found guilty and was sentenced to death; but this sentence was commuted to life imprisonment.

MIDIANITES, mid'i-än-itz, an Arab tribe, descended, according to Scripture, from Midian, the son of Abraham by Keturah. They occupied most of the country between the Arabian Gulf and the Plains of Moab. The Midianites were very troublesome neighbors to the Israelites till Gideon's victory over them. Midian ceased to be Egyptian and became Turkish in 1887. It is now part of Saudi Arabia.

MIDLAND, city, Michigan, and Midland County seat; altitude 620 feet; on the Chippewa and Tittabawassee rivers; 19 miles west of Bay City; served by the Michigan Central and Chesapeake and Ohio railroads. It is the home of one of the nation's largest chemical companies; it also derives revenue from petroleum wells in the vicinity. Midland was incorporated as a village in 1869, and as a city in 1887. Pop. (1950) 14,285.

MIDLAND, town, Province of Ontario, Canada, in Simcoe County, on Georgian Bay, about 90 miles north of Toronto by Canadian National and Canadian Pacific railway lines. It is in a good farming district and has a fine harbor which is a port of call for shipping on the upper lakes. With its elevators of a total capacity of 12,800,000 bushels, the town's main industrial activities are flour milling and three large shipbuilding and repair yards. Lumber, planing and woolen mills, foundry and machine shops are located there. Hydroelectric power is obtained from the Severn River to the east. There are five public schools and a collegiate institute, a weekly newspaper, a public library, a fine park, a hospital, and three banks. Midland is annually visited by many pilgrims to the shrine of the Jesuit martyrs of early Canada nearby. Pop. (1951) 7,206.

MIDLAND, borough, Pennsylvania, in Beaver County, 28 miles west-northwest of Pittsburgh, on the Ohio River; served by the Pennsylvania Railroad. Manufactures include coke by-products, steel and iron. Settled around 1820, the borough has a mayor-council form of government. Pop. (1950) 6,491.

MIDLAND, town, Texas, Midland County seat; 20 miles north of Odessa, and midway between Fort Worth and El Paso; altitude 2,760 feet; on the Texas and Pacific Railroad, with bus service, and three airlines; on federal and state highways.

Situated in the center of the vast Permian Basin oilfields of western Texas and southeastern New Mexico, Midland is the headquarters of more than 300 oil companies and affiliate offices operating in the area. It is also an important center of the cattle industry in a region comprising the greater part of 12 counties of Texas and New Mexico. In the vicinity, cotton, grain sorghum, fruits and vegetables are the leading crops. Business enterprises include carbon black plants, natural gasoline and extraction plants, refineries, and numerous pipeline companies.

History.—A cow town on the trail from Pecos to Fort Worth in the late 19th and early 20th century, as recently as 1921 Midland had only 1,400 inhabitants. The oil strike made that

year brought sudden wealth to the townsfolk and ranchers, also a rapid increase in the population. The unsightly oil derricks which mar the appearance of so many oil towns are not in evidence, the city fathers having decreed that no well may be drilled within the city limits. Though trees do not grow easily here, the Chinese elm, with its feathery leaves, lines the streets and open spaces.

The town has a theater and a music association, a branch of the American Association of University Women, a chapter of the League of Women Voters, and the Petroleum Club.

Settled in 1885, Midland was incorporated in 1906. Pop. (1940) 9,352; (1950) 21,713.

MIDLOTHIAN, mid-lō'thī-än (formerly EDINBURGH or EDINBURGHSHIRE), county, Scotland, on the south shore of the Firth of Forth. The northern portion is flat; the Pentland Hills cross the county from the southwest, and the Moorfoot Hills are in the southeast. The Gala, Esk, Almond, and Tyne rivers flow through the county. Agriculture, livestock raising, dairying, fisheries, shipbuilding, manufactures of paper, iron products, and carpets, and distilling of whiskey are carried on. Edinburgh is the capital city. Area of county 366 square miles; pop. (1951) 565,746.

MIDNAPORE, mid'nā-pōr, or **MIDNAPUR**, mid'nā-pōr, town, Indian Union, administrative district of Bengal. The town is the capital of the district and is 68 miles west of Calcutta. It is the center of an important indigo and silk industry, and has manufactures of brass and copper goods. The district forms the southern part of the Burdwan division of Bengal. It has an area of 5,274 square miles. Pop. (1941) 3,190,647.

MIDNIGHT JUDGES, or **APPOINTMENTS**, a term applied to executive appointments or nominations made by President John Adams, the last night of his administration. Congress had passed a bill authorizing the appointment of 18 new United States judges, and Adams with the consent of the Senate appointed judges to fill these newly created vacancies. They were known as Adams Midnight Judges. The new law was repealed early in Jefferson's term and the judges lost their offices. The suit of one of these judges, William Marbury, resulted in an important legal decision. See also *MARBURY V. MADISON*.

MIDNIGHT SUN, is the appearance of the sun above the horizon at midnight. It may be witnessed at any point on the Arctic Circle on June 21, and on the Antarctic Circle on December 21. Within these circles the length of time the sun is in the sky without setting gradually increases, being 65 days in latitude 70°, and 134 days in latitude 80°, while the sun does not set for six months at the poles. Tourists visit the north of Norway about midsummer to witness the phenomenon. This phenomenon of the midnight sun is due to the inclination of the earth's axis, and to the fact that the axis points in the same direction during the whole period of the earth's yearly revolution round the sun.

MIDRASH (Hebrew, from *darash*, to make research), among the Jews, is the general name given to the exposition or exegesis of the

Scriptures. When such writings first arose is not known, but the most flourishing period of midrashic exegesis was from about 100 B.C. to 200 A.D. The term midrash expressed "any and every ancient exposition on the law, psalms and prophets, disquisitions that took the form of allegorical illustration, homiletics or practical commentary." Thus in its most general meaning it expressed the whole uncanonical Jewish literature, including the Talmud, down to the compilation of the book *Jalkuth* in the 13th century, since which time the term gradually ceased to be applied to rabbinical writings.

MIDRIFF (A.-S. *mid*, middle; *hrif*, abdomen), the diaphragm (q.v.).

MIDSHIPMAN, in the United States Navy, is the designation of a student taking the four-year course of study at the U.S. Naval Academy, Annapolis, Md.; upon graduation he is commissioned ensign. In the British Navy, a midshipman holds the intermediate rank between a naval cadet and a sublieutenant.

MIDSHIPMAN, a California coast-fish of the genus *Porichthys*.

MIDSHIPMAN EASY, Mr. See **MR. MIDSHIPMAN EASY**.

MIDSUMMER EVE. See **JOHN'S, EVE OF SAINT**.

MIDSUMMER NIGHT'S DREAM, A, is a comedy by William Shakespeare, first printed in 1600. Probably written in 1594, or even earlier, it was doubtless written for some wedding festival as it has many of the characteristics of a masque. The incidents connected with Theseus and Hippolyta were taken from Plutarch's *Life of Theseus* and perhaps Chaucer's *Knights Tale*, while the fairy story which makes up such a large part of the play was Shakespeare's transformation of the somewhat crude elements of mediaeval folklore. The first and last acts take place in Athens at the palace of Theseus, and the other three acts in the forest near Athens. Theseus and his queen fit into the story insofar as they celebrate their nuptials, and as they are interested in the love affairs of Demetrius and Helena, Lysander and Hermia; they are brought into the forest only by their love of the chase, which is realistically portrayed. The well-known words of Theseus upon "the lunatic, the lover, and the poet, as of imagination all compact," are in striking contrast with the fantastic fairies that really dominate the play. Even further removed from fairyland are the prosaic mechanics who represent, with all the characteristics of low comedy, the story of Pyramus and Thisbe. By their rehearsal in the forest they are caught for a moment in the magic web of Oberon, Titania, and Puck. Under the same influences fall the Athenian lovers, who after unfortunate experiences are brought to the happy conclusion of their dreams. The title of the play, as indeed the major part of the story and the background, suggest the tone, the atmosphere, of the play. It is the magical midsummer night with the moon in the sky that forms the appropriate setting of the mystery, the fantasy, and the unreason of fairyland. Oberon, Titania, and Puck, along with the other incarnations of the beauty and magic of nature, have fixed in the popular imagination the principal elements of fairyland. The fact

that they were represented by boys on the Elizabethan stage gave to these creations the spirit of childhood that has been lost in the modern stage representation. No analysis can suggest the delicacy, or the beauty, or the charm of these airy nothings to which Shakespeare has given a local habitation and a name.

The comedy was also the inspiration for an overture, and music to accompany the play, composed in 1826 and 1843, respectively, by Felix Mendelssohn-Bartholdy. This work, incorporating one of the composer's most celebrated scherzos, beautifully recreates the elfin delicacy of Shakespeare's fairyland.

MIDWAY ISLANDS, a coral atoll in the North Pacific, a possession of the United States. Situated 1,300 miles northwest of Honolulu, the atoll, some six miles in diameter, contains two coral islands—on the western side Sand Island (1¾ miles long and ¾ miles wide, with an average elevation of 8 to 10 feet); and Eastern Island (1¼ miles long and ½ mile wide, with an elevation of 6 to 12 feet). The total area of the atoll is about 28 square miles, and the population in 1940 numbered 437. Both islands are partly covered with coarse grass and bushes, and are a breeding ground of the tern. Fish of many varieties, turtles, crabs, and crawfish, abound in the lagoon. Good water is obtained by sinking wells.

Midway was known as Brooks for several years after its discovery in 1859 by N. C. Brooks, commander of the Hawaiian vessel *Gambia*, who found it uninhabited. During 1887–1889 a shipwrecked crew lived on the atoll for 14 months; several of the men died from scurvy before rescue came. By Executive Order No. 199A, of Jan. 20, 1903, administration of Midway was made a responsibility of the United States Navy Department, and the same year it became a station site of the trans-Pacific cable system. In 1935 the atoll became a stopping point on the Pan American Airways service between Honolulu and the Philippines, a hostel and other facilities being erected on the north side of Sand Island; and in 1939, on the eve of World War II, the United States government commenced construction of submarine and air bases on Eastern Island. In 1941 Midway was proclaimed a national defense area, and when Japan entered the war on December 7 her warships shelled the American installations on Eastern Island the same day. Thereafter the Japanese made occasional air attacks, and on June 7–8, 1942, an air battle was fought between American and Japanese large carriers some 700 miles west of Midway; this engagement, known in history as the Battle of Midway, resulted in a severe defeat for Japan and proved to be one of the decisive naval victories of the war.

MIDWIFE TOAD, a European representative (*Alytes obstetricans*) of the family Discoglossidae, noteworthy on account of its unusual breeding habits. Pairing of this widely distributed species occurs throughout spring and summer, the female being capable of spawning from two to four times during the year. When she is ready to lay, the male, approaching from behind, grasps her about the waist and aids in the extrusion of the yellow ova. These, numbering from 50 to 100 and strung together by elastic filaments, are expelled explosively into a receptacle formed by the mother's closely pressed hind

limbs, bound behind and beneath by the feet of the male. At the moment of extrusion the male shifts his hold to a point in advance of the forelimbs and proceeds to fertilize the eggs. After this is accomplished he repeatedly thrusts his feet into the sticky mass until the strings of eggs are wound about, and adhering to, his thighs. Releasing his mate, the male midwife toad slowly hops or crawls away to the retreat where he is accustomed to spend the day. When he emerges in search of food, nocturnal dewes assist in keeping the eggs moist; during exceptionally dry weather the nursing father may even resort to brief immersions. After about three weeks, which is the time taken by the tadpoles to develop, the toad seeks out a pool in which he remains while the pollywogs liberate themselves by biting through the tough envelope. Then, and not until then, does the two-inch father toad discard his burden.

MIDWIFERY. See OBSTETRICS.

MIELATZ, mē'lāts, **Charles Frederick William**, American etcher: b. Breddin, Germany, May 24, 1860; d. New York, N. Y., June 2, 1919. Taken to the United States in childhood, he studied drawing at the Chicago, Ill., School of Design and Painting; from 1903 he maintained his studio in New York City. He was an instructor at the National Academy of Design, in that city, and became widely known for his etchings, dry points, aquatints, and lithographs. He is best known for his large number of views of New York, but he also executed rural, woodland, and marine scenes.

MIERES, myā'rās, town, Spain, located in Oviedo Province, 9 miles south-southeast from Oviedo, on the Lena or Caudal River. It is situated in a mountainous region with heavy forests and fertile land. The center of an important industrial area, it has coal, iron, sulphur, and cinnabar mines, and iron and chemical works. Pop. (1940) town, 9,616; municipality, 51,967.

MIEREVELT or **MIEREVELD**, mē'rē-vēlt, **Michiel Janszoon van**, Dutch portrait painter: b. Delft, Netherlands, May 1, 1567; d. there, June 27, 1641. As court painter to the house of Orange he did portraits of William of Orange and other princes of that house and of Nassau. He worked mainly in his native city and at The Hague.

His son **PIETER VAN MIEREVELT** (b. Delft Oct. 5, 1596; d. there, Jan. 11, 1623) followed his father's style and devoted himself similarly to portraits.

MIERIS, mē'rīs, **Frans van** (THE ELDER), Dutch painter: b. Leiden, Netherlands, April 16, 1635; d. there, March 12, 1681. The leading master of a family of painters, he was remarkable both for refinement of handling and elegance of design. His portraits and genre pictures are not conspicuous for striking and original characterization. Only two or three figures appear in most of his genres, and his compositions of this kind are delicate and smooth to a degree that renders them almost inanimate. Both his sons—**JAN** (1660-1690) and **WILLEM** (1662-1747)—became well-known painters.

His grandson, **FRANS VAN MIERIS** (THE YOUNGER): b. Leiden Dec. 24, 1689; d. there,

Oct. 22, 1763; painted genre and portraits, but did more service perhaps as a historian of his native country.

MIES VAN DER ROE, mē'ēs vān dēr rō'ē, **Ludwig**, German-born American architect and industrial designer: b. Aachen, Germany, March 27, 1886. Although he had no formal architectural education, at 15 he was doing apprentice work for local designers and architects and at 19 worked as a furniture designer with Bruno Paul in Berlin. During 1908-1911 he was an assistant to Peter Behrens, one of Germany's leading architects. Influenced by Frank Lloyd Wright, Mies experimented with original conceptions, and as early as 1919 had designed a steel skyscraper sheathed wholly in glass, and other structures—both office buildings and homes—making use of open, untrammelled spaces along strictly functional lines. Among his most notable achievements in Europe were the German pavilion for the International Exposition at Barcelona (1929) and the Tugendhat house at Brno, Czechoslovakia (1930). Meantime (1927) he had designed a cantilevered, tubular steel chair.

Mies went to the United States in 1937 and a year later became director of design at Armour Institute of Technology, Chicago, until it merged with the Lewis Institute to form the Illinois Institute of Technology in 1940, when he headed its department of architecture. He designed a group of buildings of extreme simplicity, with immense glass areas, rectangular panels of brick, and exposed steel structure; the 100-acre site was said to be the first American campus planned as an architectural unit. He became a United States citizen in 1944. In 1948-1949 and again in 1950-1951 he built two towering apartment houses characterized by himself as "skin and bones architecture."

MIESZKO I, myēsh'kō, Polish ruler: b. ?921; d. 992. Duke of Poland from 962 until his death, he is considered the historic head of the Piast dynasty. Uniting a number of principalities, he began their conversion to Christianity in 963 (or 966, according to some authorities). About this time, threatened by German encroachment, he signed a pact with Otto I, king of Germany and Holy Roman emperor. Under Mieszko I the Christian faith spread through Poland, and he has become known as the founder of the Polish state. His eldest son Boleslav I (q.v.), who succeeded him, was the first king of Poland.

MIESZKO II, king of Poland: b. 990; d. May 10, 1034. The son of Boleslav I, he was assailed by neighbors on all sides and ruled amid strife for less than 10 years (1025-1034), part of that time under the sovereignty of the German emperor. He was followed by his son, Casimir I (q.v.).

MIFFLIN, **Thomas**, American Revolutionary officer and politician: b. Philadelphia, Pa., Jan. 10, 1744; d. Lancaster, Jan. 20, 1800. He was by birth a Quaker; was graduated at Philadelphia College in 1760; entered public life in 1772 as a member of the Pennsylvania assembly; and in 1774 was elected a delegate to the Continental Congress. In 1775 he entered the army with the rank of major, and as colonel and first

aide-de-camp to George Washington accompanied him to Cambridge, Mass. He subsequently held the appointment of adjutant general, and in the spring of 1776 was commissioned as brigadier general. He fought in the Battle of Long Island, and by his energy succeeded in the latter part of 1776 in raising considerable reinforcements in Pennsylvania to recruit Washington's army. He was present at the Battle of Trenton, and did good service in driving back the enemy's line of cantonments from the Delaware. In 1777 he was made a major general, and in the same year became an active member of the faction organized for the purpose of placing Horatio Gates instead of Washington at the head of the Continental Army, and known in history as the Conway Cabal (q.v.). The project failing, he resigned his commission, and in 1782 was elected to Congress, of which body he became president during the following year. In this capacity he received from Washington the resignation of his commission as commander in chief. In 1785 he became speaker of the Pennsylvania legislature, and in 1787 was a delegate to the Constitutional Convention. In October 1788, he succeeded Benjamin Franklin as president of the Supreme Executive Council of Pennsylvania, which position he filled for two years; and from 1790 to 1799 he was governor of the state. In 1794, while holding this office, he rendered important assistance to Washington in quelling the Whisky Rebellion (q.v.).

MIFFLIN, Warner, Quaker reformer: b. Accomac County, Va., Oct. 21, 1745; d. Camden, Del., Oct. 16, 1798. For many years he worked for the abolition of slavery, manumitting his own slaves in 1774-1775. Because of Quaker principles, he refused to support the Revolutionary War, and was consequently dubbed a Tory.

MIFFLIN, Fort. See FORT MIFFLIN.

MIGDOL, mīg'dōl (Hebrew, a tower), Biblical place mentioned in Jeremiah 44:1; 46:14, as in lower Egypt; in Ezekiel 29:10; 30:6, as the northeastern limit of the country; and in Exodus 14:2 and Numbers 33:7 as a station on the route of the Israelites to the Red Sea.

MIGNARD, mē-nyār', **Pierre**, French painter and engraver: b. Troyes, France, Nov. 1610; d. Paris, May 1695. In his middle twenties he went to Italy, working mostly in Rome, whence his surname "the Roman." He painted likenesses of Popes Urban VIII and Alexander VII and of other Roman notables. In 1654 he went to Venice where his success as a portrait painter continued. Summoned to Paris by Louis XIV, he did portraits of the young king, of ladies of the court, and of Cardinal Mazarin, and afterward decorated the cupola of the church of Val-de-Grace with over 200 figures of prophets, martyrs, etc. He subsequently produced some paintings for the palace of Versailles and was made court painter and director (1690) of the Gobelin tapestry works.

His brother, **NICOLAS MIGNARD** (b. Troyes, 1606; d. Paris, 1668), also was a noted portraitist. He did paintings of Louis and other court dignitaries, and decorations for the Tuileries.

MIGNE, mēn'y', **Jacques Paul**, French Roman Catholic priest and publisher: b. Saint-Flour, France, Oct. 25, 1800; d. Paris, Oct. 24,

1875. He was educated at Orleans, was ordained in 1824, and in 1833 went to Paris and founded *L'Univers religieux*, which later became *L'Univers*. In 1836 he disposed of his interest in that publication and established a publishing house for the production of religious books in inexpensive editions. Perhaps most important was the *Patrology*, published as *Patrologiae cursus completus* (Latin series, 221 vols., 1844-1864; Greek series, in Latin, 81 vols., 1856-1861; Greek series, with Greek text and Latin trans., 166 vols. 1857-1866).

MIGNET, mē-nyé', **François Auguste Marie**, French historian: b. Aix, France, May 8, 1796; d. Paris, March 24, 1884. He was educated at Avignon; studied law in Aix and was admitted to the bar in 1818; went to Paris in 1822 after winning a prize for his essay on French institutions of the 13th century. In 1830, with Armand Carrel and his lifelong friend Louis Adolphe Thiers, he founded the liberal, anti-Bourbon journal *Le National*. He was elected to the Academy in 1836; and after the Revolution of 1848 lost the place he had held for 18 years as archivist of the Foreign Office. His most important work was *Histoire de la Révolution française* (1824). Besides this he wrote biographies of Benjamin Franklin (1848), of Mary Stuart (1851), and of Charles V (1854).

MIGNON, mē-nyôn', **Abraham**, Dutch painter: b. Frankfurt am Main, Germany, 1640; d. there or at Wetzlar, ?1679. Going to Holland when he was about 20, he studied under Jan Davidz de Heem, the still-life artist whose style he followed. With a delicate touch, Mignon concentrated on flowers, fruits, birds and other small animals, achieving great finish in his work.

MIGNON, French term of endearment (darling, favorite, pet), sometimes used as a given name. 1. The efflike Italian girl, daughter of an aged harpist, who dies in despair through unrequited love in Goethe's *Wilhelm Meister's Apprenticeship*. 2. Opera by Ambroise Thomas, founded on *Wilhelm Meister*, with words by Michel Carré and Jules Barbier, first produced in Paris in 1866, in London in 1870, and in New York in 1871. 3. A term of opprobrium applied to certain favorites of Henry III of France, youths of frivolous habits and effeminately fashionable dress, popularly charged with dissolute morals and generally hated because of the king's lavish generosity to them.

MIGNONETTE, mīn-yūn-ēt', a genus (*Reseda*) of annual and perennial herbs of the family Resedaceae. The species, of which there are about 50, are natives of western Asia and the Mediterranean region. They have simple or compound leaves, and terminal spikes of small, pale, usually greenish flowers. Less than half a dozen species are cultivated, the most important being the common mignonette (*R. odorata*), a universal favorite both in gardens and in green-houses because of its fragrant flowers. It is a branching annual herb of decumbent habit when in its prime, and will thrive in any cool, moist, fairly rich soil, when partly shaded from the noonday sun. For outdoor blooming the seeds are sown successively from early spring to midsummer, and for winter blossoming from that time forward at intervals of three or four weeks.

MIGRAINE, OPHTHALMIC MIGRAINE, or SICK HEADACHE, a very widespread affection, also known as megrim, hemicrania or bilious headache. It is a vaso-motor disturbance; in other words, one in which the nerves which expand or contract the arteries and blood vessels are affected, thus restricting the flow of blood. The number of happenings which may cause this malady is exceedingly great, including such diverse causes as the merely physical ones of severe blows, falls, fast movements, sudden alteration of temperature or of atmospheric pressure. Migraine may also be caused by chemical stimuli such as nicotine, and by the secretions of various glands of the body such as the thyroid. It is often, too, caused by some other deep physiological alteration, such as that experienced in extreme fatigue, or that coming from some other disease such as meningitis or tumors. It may also have as chief cause some undue emotional strain as in great anger, in fear (which produces important changes in metabolism, q.v.), in disappointment or in chagrin. The vital point about the mental causes is that they may not always be in consciousness, but may be solely in the unconscious, and will therefore be quite unknown and unknowable to the average person, unless he can receive treatment at the hands of an experienced psychoanalyst. (See PSYCHO-ANALYSIS). If the causes act through the cerebral sympathetic nervous system, they may produce spasms of the vaso-motor muscles such that the blood pressure is increased in the brain.

The study of the worst forms of the disease alone has enabled investigators to correlate the multiform symptoms into a consistent picture. Fortunately the worst forms are not the commonest, which may be termed abortive forms. In these abortive forms now one and now another of the symptoms appear in individual cases, some having many or most of the symptoms, but in different attacks. One patient, for instance, is on record who in 15 years had at different times all the variations of the disease which have been reported.

The commonest abortive attacks of migraine begin with chilliness, sometimes accompanied by cold feet and pinched face. Apprehension, depression and general wretchedness then follow, sometimes accompanied by a peculiar defect of sight which is known as scotoma. This is a spot in the visual field, quite distinct from the quite ordinary "blind spot," but one which interferes with the sight to a varying extent, and goes through different phases, sometimes within the short space of 20 minutes, constituting, in the cases where it does occur, the prelude to the actual pain in the head. The scotoma begins only as a slight blurring, noticeable especially when reading. The attention directed to it shows a cloudy spot which shifts with the eye, as it changes its direction. Gradually the spot expands into more or less crescent shape, usually being found in the left eye. The interference in vision is however sometimes found to affect only the upper half of the field of vision, while in rarer instances a temporary total blindness occurs.

Another important disturbance associated with migraine is that of speech. Not only is the ability to pronounce certain words affected,

but the comprehension is also sometimes interfered with. Inability to write is not unknown and also a disturbance of the auditory images used in singing. A case has even been described in which unsteadiness of gait was coupled with a sensation that the body or particular parts of it were doubled.

The headache itself is, however, the most important symptom and has an infinite variability as to its location, its quality, its duration and its intensity. The commonest form appears a quarter or a half an hour after the appearance of the other phenomena including the scotoma, and is generally confined to one side of the head, hence its name: migraine (from *hemicrania*, Greek for "half head"). But cases occur where it involves both sides or may be in the front or back of the head. In many cases the eyes alone are the seat of the pain, while in others the pain may be in the neck. The quality of the pain is described generally as lancinating. Some sufferers become hysterical, rolling on the floor and holding their heads with both hands, and shrieking with pain. Others with less acute suffering describe the pain as beating or thumping, particularly when stooping or requiring to do any violent exercise. All the phenomena of the pain indicate a change in pressure of blood within the brain, a change which may be either an increase or a decrease. The pain is aggravated in diverse ways in different patients, sometimes increasing on the taking of alcohol, on smoking, on eating, which sometimes on the contrary helps, on being subjected to sudden and loud noises, or to strong light. It has been found, too, that certain odors increase the pain, such as that of cooking and of certain drugs like chloroform or ether. The vaso-motor disturbances which accompany all cases of migraine are manifested in the coldness, paleness and gooseflesh, evidences of constriction in the calibre of the blood vessels, or in the redness of skin and even discharge of blood from various parts of the body. The secretions are frequently affected.

The connection between migraine and the mental factors which are above enumerated as among its causes is a matter which is being investigated at the present day through the technique of psychoanalysis (q.v.), which has unearthed much material going to show that the left sided headache represents an unconscious conflict relating to some love affair, while those on the right side are associated with fantasies concerning the nutritive libido. As a preliminary to the onset of the sickness the general conscious situation of the patient may show a slight or almost unnoticeable or even a profound change, varying from violent agitation to mild depression. In the observation of one specialist 25 per cent of the patients showed psychical symptoms, and while others show a smaller proportion, the presence of the purely mental element indicates that an important if not exclusive factor in the causation of the malady is the unconscious conflict. Treatment consists in removing as far as possible all the physical causes known to produce migraine, such as eye-strain, adenoids, diseased turbinates, constipation, dysmenorrhea, etc., or gastrointestinal disorders, and if the migraine still persists, there is very good reason to believe that the condition is the result solely of the

unconscious conflict. In this case the patient should receive analysis from an experienced psychoanalyst.

SMITH ELY JELLIFFE.

MIGRATION. The term migration is often used very loosely in popular writings about animals, so that it seems wise to define it as limited in the present article to: (1) The annual change of residence by a species with the change of seasons from winter to summer or the reverse; (2) irregular mass-movements of a species under pressure of famine, over-population of a locality, or some more obscure influence. While these classes have been enumerated in the order of their prominence to our eyes, especially in the behavior of birds, it will be well to consider the second sort of migrations first, as these sporadic cases may throw light on the more regular phenomena, and how they came to be habitual.

Insects.—An eminent entomologist tells us that certain butterflies, as our milkweed fritillary (*Anosia plexippus*) and the cotton moth (*Aletia argillacea*), pass northward in the United States for hundreds of miles in spring, and again in huge swarms southward in autumn; but whether the individuals are the same is not determined. (See MILKWEED BUTTERFLY). Among other butterflies periodical migrations occur, as in movements of vast columns across the Isthmus of Panama out to sea, and flights miles in breadth have been observed to cross Ceylon, the individuals occupying several continuous days in their passage. Wallace observed the swarming of pierid butterflies in the Indian Ocean, and Clark in Venezuela, the vast throng composed of males moving steadily eastward for several days in the face of the trade winds.

The late Dr. A. S. Packard, whose special studies of the habits of the Rocky Mountain locust about 1880 were so valuable, reported that that destructive insect is migratory in certain seasons favorable to the species when over-production occurs; the young on hatching, after having devoured every green thing at hand, are forced, when becoming winged, to rise in enormous swarms and sail on the wings of the wind for hundreds of miles to other regions where they lay their eggs. The next year's brood sometimes returns to the original spawning ground to lay their eggs. The same thing is characteristic of similar locusts in Syria and central Africa.

Crustacea.—The members of several families of crabs, mostly tropical, have acquired the power of living out of water, and even of wandering extensively inland, but regularly return to the sea, sometimes in marching hordes, to deposit their eggs in the water, after which they go back to the highlands. See LAND CRABS.

Fishes.—Many kinds of fishes are regular migrants; the anadromous families, such as those of the shad, herring and salmon, annually ascend the rivers to spawn, whence in some cases they return to the sea, in others never get back, but their young, after the succeeding winter, go back to salt water. Certain fishes retire to the deeper or warmer parts of the ocean during the winter, but in early summer travel toward the shore-shallows, or to the cool north, in vast swarms; and the same is true of a large variety of other marine creatures, including some of the humblest and most minute

forms, in which cases the direction of the mass-movements are largely determined by the ocean currents. Moreover there occurs in the ocean a regular movement of deep-sea forms toward the surface in the night, the animals sinking again as daylight approaches. Fishermen in the north Atlantic and on the coast of Norway are familiar with the vast influx in the spring of such fishes as herrings, cod, plaice and capelan. The eminent Norwegian naturalist, G. O. Sars, concluded that some of these fish-migrations were undertaken in order to obtain food, and others for the purpose of reproduction. "When the capelan gathers in millions on the coast-banks of Finmark or Labrador, when countless numbers of cod approach the banks of Lofoten, and when the herrings flock to western Norway, they migrate to spawn. The fat-herring collecting off the coast of Nordland, and the cod gathering around the shoals of capelan in the Barents Sea, are examples of feeding-migrations."

Sea-turtles have a similar history, going regularly toward shore in the breeding season to deposit eggs in the beach sand.

Mammals.—The reader will have perceived that most of the foregoing cases are not examples of true migration because the element of habitual return is absent, or at best a very few survive to return; or else the movement, when seasonal and regular, is purely local, such as going to the nearest shore for spawning; or is merely the pursuit of traveling prey. In this class must be put most of the so-called migrations of mammals. From time to time certain small animals, as lemmings, field-mice, squirrels and the like, develop enormous numbers in some region (or formerly did so, before civilization was so worldwide) and overflow in great "armies" into neighboring parts of the country, where they gradually expire. In the plains regions of the world a lack of good pasture in one place will often cause movement of antelopes, bisons, etc., to some better district in great herds; and in other situations the wild animals are accustomed to go up into the hills in summer and come down to the shelter of the valleys in winter, but these are local movements. The only examples of real migration afforded by the mammals are the case of certain bats that regularly journey every year between the tropics and more northern climes, and the case of the caribou and, to a less extent, the reindeer. These deer do make a real fall migration from the barren Arctic coast to the margin of the forested region southward and go back in the spring. It is to the birds then, that we must turn for a study of migration in the stricter sense of the term, and even here it is only partial as regards many species and groups.

Migration of Birds.—This subject is so large that we can give no more than a superficial sketch, following in general the lines of investigation conducted by the late Wells W. Cooke, of the United States Biological Survey who devoted almost his whole life to a study of this phase of ornithology as exhibited especially in North America.

The motive or cause of the periodical migration of birds has excited inquiry since ancient times, and at present two different methods of explaining it are in vogue. The opinion is general that in Pleistocene times, just previous

to the advance of the cold climate and finally to the great accumulations of ice and snow over the northern parts of the world, the whole of the northern hemisphere possessed a mild climate, and birds of every sort dwelt comfortably all the year round throughout virtually its whole extent. The coming of the Glacial Period so affected the north, as to limit more and more the residence in winter of birds there, although in summer they might venture somewhat toward it, when vegetation and insect life annually revived. As the ice advanced very gradually, now and then receding, but on the whole enlarging itself, these enforced northward and southward movements of the birds increased both in distance and duration, until migration became a fixed habit with all birds whose life was affected by the change of climatic conditions. Finally most northern birds were restricted all the year to middle America and the Mediterranean region and southern Asia. But the habit of migration had been formed, and when the glacial ice began to retreat toward its present position, the birds annually followed its receding margin, until at last they had established their present long and diversified migration routes.

Thus far all theorists are in substantial agreement. The divergence is as to the prevailing motive. One school argues that a longing to continue their inherited habit of residence in the north, and individually to return to their birthplaces, is the incentive that compels them to leave the tropics and make a journey, often of surprising length, every spring. The other school maintains that "the birds' real home is in the Southland"; that that region becomes overcrowded, and the birds in annually flying northward are seeking a region where there is less crowding and less competition for food. The truth perhaps lies in a combination of these influences, varying in intensity with different kinds of birds. It is an important circumstance, especially with reference to the second theory, that no similar migration occurs southward from the tropics to Bolivia and Argentina, whose plains and mountains offer a poor supply of bird-food, and not much more from the equatorial to South-African districts. "The conclusion is inevitable," Cooke believes, "that the advantages of the United States and Canada as a summer home, and the superb conditions of climate and food for successful rearing of a nestful of voracious young, far overbalanced the hazards and disasters of the journey thither. It must be remembered too that the migratory species have acquired various adaptations relating to their migrating habits that tend to fit them more and more to endure the exertion and danger required; also that the regular routes followed by each species are the products of thousands of generations of experience, and presumably represent the easiest way in each case.

Phenomena of Bird-Migration.—In the restricted space of this article it is impossible to go into detail as to the general subject, and attention must be confined mainly to what appears in North America. Australasia and the South Pacific islands share to some extent in the annual movements of continental species, but have an inter-insular migratory system of their own. "In Europe," says a recent re-

viewer, "and central Asia there are numerous routes, at least nine, according to Palmen. Of these one begins on the Siberian shores of the Polar Sea, Nova Zembla, and the north of Russia, and passes down the western coast of Norway to the North Sea and the British Isles; another arising in Spitzbergen follows much the same course, but is prolonged past France and Spain to the west coast of Africa. Many migrants wintering in North Africa (Algeria, etc.) have flown there from northern Russia, by way of the Baltic Sea, Holland, passing up the Rhine Valley, and crossing to the Rhone, the column splitting on reaching the Mediterranean, one line of migration passing along western Italy and Sicily, a second crossing by way of Corsica and Sardinia, the third by southern France and eastern Spain. Egypt receives its winter visitors from the Russian river-valleys of the Obi and Volga, the line crossing the Black, Bosphorus and Aegean seas to the Nile Valley. One important migration-route is to and from India along the Danube Valley and across Persia."

An important fact to consider at first is that the migratory habit is possessed in its completeness by comparatively few birds, and these belong almost wholly to a single order, that of the *Passeres*, or insect-eating song-birds. The exceptions are mainly sea-fowl and certain water-birds. Even in these groups two classes are to be found, one of species that are resident the year round in the regions they severally occupy; and the other whose migrations are of slight extent. Even in the northern half of the United States many birds are present in winter, some of which are those that retreat from the North only so far as driven by deep snow and excessive cold; while the Southern States have a longer list of resident birds, supplemented in winter by many kinds that moved only a little way southward to escape the dearth of food at that season in the snowy parts of the country. This shows that in respect to distance, migration varies from a distance almost as great as the breadth of the globe (the Arctic tern passes annually from Patagonia to Alaska, and back again) to no change of residence at all, even on the Arctic coast and islands.

Northward Movement in Spring.—Let us now consider the actions of the real migrants, who have been spending the winter in tropical America, on the arrival of spring. Nothing that we can see compels them to move, yet they abandon the delights of their winter home and proceed northward as soon as the proper time comes. This "proper time" seems to have no relation to the weather or to food-conditions there in the tropics, which are almost changeless, but is determined by the weather and food conditions the bird will find when it arrives at its northern destination, if the season there be an average one. This varies with the requirements of different birds, so that some start much earlier than others. Thus the ducks and geese, which ask only that the rivers and ponds in the north shall be free from ice, come to us much earlier than do the warblers and flycatchers that must wait until flowers are in bloom and insects numerous. As the last are the most numerous they come in crowds soon after the leafing-out of the northern woods and orchards.

Not all, however, pursue the same route, although each species keeps to its traditional path until it arrives in the district suitable to it, when it scatters. The configuration of continents, narrowing into a mere isthmus between North and South America, permits only a very narrow land-path for the migrants between their winter and summer resorts, yet most of those who winter south of Panama crowd along this narrow neck. Certain shore-birds, confident of their strength, strike straight north from Brazil to Nova Scotia, and a few species follow the line of the Antilles from Venezuela to Florida. Birds whose destination is California and northward follow the western coast of Mexico, and those aiming at summer homes in the Rocky Mountain region pass straight north through central Mexico and across the desert, or skirt the eastern coast of Texas and the plains. All these are habitual routes for certain species. The great body of migrants, whose songs are later to be heard in the eastern United States and Canada, fly straight across the Gulf of Mexico from Yucatan to landings on the northern shore all the way from eastern Texas to Florida. Arrived there—and as a rule this is about daylight, the journey from Yucatan having taken but one night—they spread northward along two main channels, one up the coast eastward of the Alleghanian Mountains (diverging into these uplands at each river valley); and two up the Mississippi Valley, separating into bands that ascend every tributary, and rapidly cover the whole country, while those bold species, surprisingly many in number, who are content only in the subarctic zone, hasten on to Alaska and down the Mackenzie Valley. The point to keep in mind in this general sketch is that every species pursues the same route every year, and sometimes it is far from the most direct one. The speed of travel is not great as a rule. The birds must feed by the way, and this food must be found as a rule by daylight; therefore, most species travel during the night, and are often delayed by foggy, rainy nights or by cold storms. The swallows, swifts, night-jars, hawks and some others that capture their prey on the wing feed as they go and probably rest at night. Those bound for the far north must and do move more rapidly than the southern breeders; and Cooke has gathered some very interesting statistics on this matter.

Autumnal Migration.—The autumnal return of the birds presents some very different features. It begins in the far north before any change in weather or food suggests the necessity of departure, and is led by male birds, after whom the mothers and young follow as soon as they have strength to travel. The movement is far less direct and hurried than the spring flight. They make a long stage by night, flying sometimes a mile or more above the earth, and drop down at dawn to feed and rest, then loaf along. The members of each species gather gradually into the regular route, which in many cases is quite different from that followed northward in May; and those that are inclined to flocking at this season form large companies that go on together, striking out at last from the Gulf shore to cross in a night that space of dark water, or disappearing in the Mexican forests.

How do Birds in Migration find Their

Way?—We have seen that they follow definite routes; also that these in places lead across wide spaces of water; also that the routes in some cases differ according to season; and had we been able to give more details it would appear that often these routes are very eccentric. Moreover, they travel mostly at night; and finally certain species cross areas of ocean hundreds of miles wide, and far from land, as when golden plovers fly from Nova Scotia to the Middle and South Atlantic States and in the case of the curlews that migrate between Australia and New Zealand. It is also pleasingly evident that birds return year after year to the same grove, dooryard and nesting-place. How do they do it?

It was formerly taught that they followed landmarks, such as coast lines, ranges of mountains and large river-courses, which are visible even on clear nights from a great height, and doubtless these are aids to the day-fliers and when the sky is clear. But many lines of migration cut across such landmarks, instead of follow them, and others stretch across wide plains and vast water-spaces. Other theories, as of magnetic influences, etc., are without value. It appears plain that birds are guided by an innate sense of direction. This need not be esteemed miraculous, for in a lesser degree it is possessed not only by various other animals, but by wild men, especially those who dwell in a forested region, where in following game they would become lost daily had they not a faculty for orientation. The direct testimony to such a faculty in savage mankind, and comparison of the evident ability of many animals in this direction, makes its presence in the minds of birds easily credible, the more so as the sense is by no means infallible, since birds sometimes become completely bewildered when buffeted about at sea by high winds. Add the elements of observation and memory and a sufficient explanation is at hand of how migratory birds find their way.

Bibliography.—An early treatise on this subject of much value is by Alfred Newton in his 'Dictionary of Birds' (London and New York 1893-96). See also introduction to Chapman's 'Handbook of Birds' (1912); articles by W. W. Cooke in Bulletin 185, U. S. Department of Agriculture (1915); National Geographic Society, 'Book of Birds' (1927); Howard, 'Introduction to the Study of Bird Behavior' (1929); Wetmore, 'Migrations of Birds' (1930); Berg, 'To Africa with the Migratory Birds' (1930); and Allen, 'Book of Bird Life' (1931).

ERNEST INGERSOLL.

MIGUEL, mē-gēl', Dom Maria Evaristo, Portuguese pretender, son of John VI of Portugal: b. Lisbon, 26 Oct. 1802; d. Castle Brunnbach, Baden, 14 Nov. 1866. He was brought up in Brazil, and upon the accession of his father repeatedly raised rebellion as head of the Absolutists. In 1826 after his father's death he was made regent, but proclaimed himself king, attempted to keep Maria de Gloria, the real heir to the throne, who had been offered to him in marriage, out of the kingdom, and was successful until Dom Pedro of Brazil came to the aid of his daughter Maria, defeated Miguel and forced him to leave Portugal. Miguel is usually described by the

faction hostile to him as ignorant, vicious, and drunken, but his coreligionists make him a model prince.

MIHAJLOVIC, mē-hī'lō-vēt'y', **Draža**, Balkan guerrilla leader, b. Shumadija, near Belgrade, Serbia, 1893; d. by execution, Belgrade, July 17, 1946. He fought in both Balkan Wars and World War I, attended staff schools and became colonel in 1940. When the Nazis overran Yugoslavia the next year, Mihajlović retreated to mountains near Belgrade, picking up stragglers whom he organized into *chetniks*, guerrillas in the old Serb tradition. He was effective against the invader and was made war minister by King Peter II in 1942. But his Serbs fell into conflict with the Croat and Communist forces of Joseph Broz, or Tito (q.v.); they and their leader were accused of collaboration with the Axis against their countrymen. The *chetniks* were deprived of Allied support, Mihajlović himself being dismissed as minister of war in May 1944. His following diminished to a handful before Tito captured him in hiding, March 13, 1946. His subsequent trial for treason and collaboration was widely condemned by world opinion as political.

MIKADO (Japanese *Mi*, exalted, *Kado*, gate), an ancient and poetic title of the Japanese emperor, similar to the Sublime Porte title of the Ottomans; probably transferred to the ruler and judge from the gateway to his palace, where he did justice. It was never a separate title for a spiritual ruler; this incorrect idea results from the historical fact that much of the mikado's or emperor's temporal power was usurped before 1867 by shoguns or generals, who, however, always admitted that they derived their power from him. The present mikado, Emperor Hirohito (r. Dec. 25, 1926–) is the 124th of his line, which legend dates back to 660 B.C.; of him the title mikado, essentially a foreign solecism, is much less used than *Dai Nippon Teikoku Tennō*, "Imperial Son of Heaven of Great Japan." *Tennō* corresponds to the English word emperor.

MIKADO, *The*, or **THE TOWN OF TITIPU**, a comic opera in two acts, libretto by W. S. Gilbert, music by Sir Arthur Sullivan; first production, Savoy Theatre, London, March 14, 1885; first American performance at the Museum, Chicago, July 6, 1885. The plot is simple burlesque, without the infusion of any Eastern imagery. The Mikado, a highly moral ruler, has issued an edict condemning to death every man found guilty of flirtation "unless connubially linked." To evade this stern sentence the citizens of Titipu appoint one thus condemned (Ko-Ko the tailor) to the office of executioner, with the result that he could not behead the next man until he had first executed himself. It being necessary eventually to execute someone, Ko-Ko, who is engaged to Yum-Yum and is also first on the list of the condemned, finds a substitute in Nanki-Poo, (the Mikado's son in disguise), who had gone into temporary hiding to avoid marrying the elderly Katisha. Nanki-Poo agrees to suffer execution in a month provided he can be married to Yum-Yum for that period. In the end Nanki-Poo is forgiven and weds Yum-Yum, and Ko-Ko saves himself by marrying Katisha. An amusing character is Poo-Bah, "Lord High Everything Else."

MIKANIA (also known as **WILLUGBAEYA**;

both neo-Latin from the names of J. C. or J. G. Mikan and Francis Willughby respectively), a genus of composite plants of the tribe *Eupatorieae* and the subtribe *Agerateae*. It is widespread throughout tropical and temperate America and grows either in an erect shrub or in twining vines. The genus numbers about 150 recognized varieties, all natives of the warmer regions of America, except one species which grows in Asia and tropical Africa. The plant is characterized by opposite leaves, heart-shaped or triangular, toothed at the base and with petioles. The flowers are small and white, pinkish or yellowish. The tropical types, *M. amara*, *M. cordifolia* and *M. guaco* have a high reputation in South America as snakebite cures and a medicine made from them is also supposed to make one immune from snakebite.

MIKKELSEN, Ejnar, Danish polar explorer: b. Vester Brønderslev, Jutland, Dec. 23, 1880. A son of Aksel Mikkelsen, he was a member of the Amstrup expedition to Christian XI Land, East Greenland, in 1900, and in 1901–1902 served with the Baldwin-Ziegler expedition to Fratz Josef Land. With Ernest de K. Leffingwell he organized an Anglo-American expedition to the north of Alaska and determined the position of the continental shelf of the Arctic Ocean (1906–1908). His expedition to the north coast of Greenland in 1909–1912 resulted in his recovery of the records of the lost explorers Mylius-Erichsen and Høeg-Hagens. In 1925 he led an experimental fishing cruise to West Greenland. In 1933 he became inspector general of East Greenland, retiring in 1951. Governor of the Arctic Institute of North America in 1948, he was made chairman of the Danish Arctic Institute in 1954.

MIKLOSICH or **MIKLOSIC**, mē'klō shīch, **Franz von**, or **Franjo**, Slavic philologist: b. Luttenberg, Styria, Austria, Nov. 20, 1813; d. Vienna, March 7, 1891. Taking his degree in philosophy at Gratz and in law at Vienna, for a time he taught philosophy at Gratz, then in 1838 commenced a law practice in Vienna. There the famous Slovenian scholar Bartholomäus Kopitar (q.v.) roused his interest in Slavic philology. He first gained scholarly note by a review of Bopp's *Comparative Grammar*, in 1844, and the same year obtained a post in the Imperial Library. Thenceforth he devoted himself exclusively to philology. In 1850 he was appointed professor of Slavic philology at the University of Vienna, a post he retained until 1886. He was also government censor of Slavic, Rumanian, and Greek publications. A man of profound scholarship, he not only revolutionized modern Slavonic philology but made important contributions to the knowledge of the Albanian, Gypsy, modern Greek, Hungarian and Rumanian languages. He was a member of the Academy of Vienna and a corresponding member of the French Academy of Inscriptions. He published a number of works, all of high importance; among the most notable are *Vergleichende Grammatik der Slavischen Sprachen*, 4 vols. (Vienna 1868–1879); and *Etymologisches Wörterbuch der Slavischen Sprachen* (Vienna 1886).

MILAN, mī-lān (Ital. **MILANO** mē-lā'-nō), province, Lombardy Region, north Italy, comprising part of the fertile Po plain, between the Adda and Ticino rivers. Area, 1,065 square miles.

The province is the most highly industrialized in Italy, as not only its capital, Milan, but also such centers as Monza, Sesto San Giovanni, Legnano, Rho, and Abbiategrasso have a variety of industries: textiles, machinery, metallurgical products, chemicals, shoes and furniture are among the province's products. The chief crops are cereals, rice, fruit and vegetables. Silkworms are grown and stockraising is also important. Lodi and Gorgonzola are the centers of a flourishing dairy and sausage manufacturing industry. Pop. (1951) 2,500,228.

MILAN (ancient **MEDIOLANUM**), city and commune, northern Italy, the capital of Milan Province and of the region of Lombardy, is located in the fertile Po plain, midway between the Po River and the Alpine foothills, 300 miles northwest of Rome. The second city of Italy in population and the country's chief industrial, financial and commercial center, it is the seat of an archdiocese. The climate is continental, with cold winters and hot summers; fogs are frequent in winter and fall.

Economic and Cultural Life.—The importance of Milan is largely due to its geographic situation, at the intersection of communication lines connecting all parts of Europe and the Mediterranean. Highways, rails and airlines radiate in all directions from the city and canals connect it with the Po. Milan is the headquarters of great import and export firms, and for the major industries and banks of the country; its stock exchange is the leading one in Italy. The commercial fair held in April is one of the most important in Europe. The chief industries are textiles (Milan being, with Lyon, the leading European silk manufactory), machinery and metal products (aircraft, automobiles, railroad equipment, agricultural machinery), printing and publishing (especially music), electrical appliances, chemicals, pharmaceuticals, furniture and food products. Recently it has also become a world fashion center. The most progressive city in Italy, it has long been the center of the trade union movement.

The cultural traditions of Milan are ancient. It is the seat of many societies such as the *Istituto lombardo di scienze e lettere*, founded in 1797, and the *Accademia scientifica letteraria*. Art exhibitions are held in the modern Palazzo dell'Arte, including the Triennale of decorative arts. Milan is also a music and drama center with numerous theaters and concert halls including the famous La Scala Opera. Educational facilities are excellent: the main institutions of higher learning are one state and one Catholic university, the Luigi Bocconi school of commerce, an engineering school, the Brera Academy of Fine Arts and the Giuseppe Verdi Conservatory of Music. There are also important libraries, especially the Ambrosiana. Besides the museums mentioned below there are the Poldi-Pezzoli Museum, one of the finest art collections in Europe, the Natural History Museum, a numismatic collection in the Castello and a gallery of modern art. In the Brera Palace is the astronomical observatory (1763).

The City.—The general appearance of Milan is that of a modern metropolis. The rise after World War I was spectacular both in the economy and in population. The same expansion took place after World War II; despite very heavy damage from Allied air raids, especially in 1943, the city

Ewing Galloway

The Duomo or cathedral of Milan.

recovered swiftly. Whole quarters have been redeveloped and others planned. The old part of the city, polygonal in shape, still has many narrow winding streets but the main thoroughfares have been enlarged to handle the increasing traffic. The center of the city is the Piazza del Duomo, from which radiate a number of streets leading to the suburbs; Milan has spread well beyond its former walls and new residential and industrial quarters are expanding in every direction. The most notable structure is the cathedral on the east side of the Piazza del Duomo, the most important Gothic structure in Italy. Started by an unknown architect in 1386, who was inspired by the Gothic cathedrals of northern Europe, it was continued by French, German, and Italian master masons; although consecrated by St. Charles Borromeo in 1577 it was completed in the 19th century. The exterior is adorned with a profusion of pinnacles, statues, and other ornaments, and the highest pinnacle (354 feet) is topped by a gold-covered statue of the Madonna. On the north side of the Piazza is the Galleria Vittorio Emanuele, lined with cafés and elegant shops, which leads to the Piazza della Scala, with its world-renowned La Scala Theater built by Piermarini in 1778. Damaged during the war, it was modernized and reopened in 1946. Opposite is the Palazzo Marino, seat of the municipal government, which also suffered severely in World War II. West of the Piazza del Duomo is the Piazza dei Mercanti, medieval center of Milan, surrounded by old buildings including the Palazzo della Ragione (1223-1238) and the Loggia degli Osii (1316). Farther west is the Ambrosiana Palace (1603-1609) containing the library, an art gallery with works of the Lombard school, and a special exhibition dedicated to Leonardo da Vinci who lived and worked in Milan for several years. One of his most famous paintings, *The Last Supper*, is in the refectory adjacent to the Church of Santa Maria delle Grazie. The fresco is now undergoing a delicate work of restoration. In the Brera Palace, also war-damaged, is one of the finest art collections of Italy, recently reorganized and modernized; among its treasures are the *Marriage of the Virgin* by Raphael and the *Dead Christ* by Mantegna. Northwest of the Piazza del Duomo is the Castello Sforzesco, an imposing Renaissance moated castle, built by Francesco I Sforza in 1450 as the residence and fortress of the lords of Milan. It was enriched by Leonardo and Bramante but later became a barracks. It now contains a number of collections and libraries. In the ducal chapel is Michelangelo's uncompleted *Pietà*

Rondanini. The other great Renaissance structure of Milan was the Ospedale Maggiore, founded in 1456. Virtually destroyed in World War II, it is being rebuilt. Milan's oldest church is the Basilica di Sant'Ambrogio, founded in 386 by St. Ambrose, the bishop of Milan and its patron saint, who is buried in the crypt. Rebuilt early in the 12th century, it is one of the most typical examples of Romanesque-Lombard architecture; the main altarpiece is a splendid example of medieval goldsmithing. The Basilica of San Lorenzo Maggiore, originally of the 6th century, was restored in the 16th. Also worthy of mention are San Satiro, designed by Donato d'Agnolo Bramante (1476-1514) and Sant' Eustorgio, with a fine Renaissance chapel (1462-1468).

History.—Originally a Celtic settlement, Milan was seized by Rome in 222 B.C. Diocletian made it an imperial residence and in the 4th century A.D. it became a religious center; the Edict of Milan, granting religious tolerance to all sects throughout the empire, was issued in 313 A.D. by Constantine. Ambrose was bishop from 374 to 397. In the 12th century it was a free commune, and although sacked by Frederick I in 1158 and 1162, it rose again and contributed with the Lombard League cities to Frederick's defeat at Legnano in 1176. At the Peace of Constance (1183) the emperor recognized Milanese independence; in spite of internal strife between Guelphs and Ghibellines (q.v.) and struggles with neighboring cities Milan continued to grow. The Torriani, leaders of the popular party, gained control, and Martino della Torre became lord of Milan in 1259, but one of his successors was beaten in 1277 by the aristocratic leaders, the Visconti (q.v.).

Ottone Visconti, archbishop since 1262, became lord of Milan in 1277 and Matteo Visconti imperial vicar in 1311. Under Gian Galeazzo Visconti, made duke of Milan in 1395 by Emperor Wenceslas, the family reached its peak. When in 1447 Filippo Maria Visconti died without male issue, the Ambrosian Republic was proclaimed, but three years later Francesco Sforza, husband of Filippo's daughter Bianca Maria Visconti, succeeded in gaining power. Under the Sforza (q.v.) the Duchy of Milan became one of the most powerful states in Italy, playing a leading role in the peninsula's politics. Rival claims to Milan, however, brought Louis XII of France to Italy in 1499.

Milan changed hands several times, a pawn in the rivalry between France and Spain. After the death of Francesco II Sforza in 1535, Milan came under Spanish domination. Ruled by incompetent Spanish governors, the city had a long period of decline, but at the end of the War of the Spanish Succession, the Treaty of Utrecht (1713) assigned it to Austria, and a recovery took place. It fell to the troops of Napoleon in 1796, as described in Stendhal's *The Charterhouse of Parma*, and was part of Napoleon's puppet Italian republics and kingdom (1797-1814). In 1805 Napoleon was crowned with the Iron Crown of Lombardy in Milan Cathedral. Austrian rule was restored in 1815, but political repression soon became intolerable. In 1848, during the Risorgimento, the people chased the Austrians from the city, but they returned a few months later. Only in 1859 was Milan liberated from foreign rule and incorporated in the kingdom of Sardinia, which in 1861 became the kingdom of Italy. Milan has prospered ever

since. After World War I it was the center of the Fascist movement; Benito Mussolini left Milan for Rome in 1922 to assume the premiership. Pop. of the commune (1951) 1,268,994.

MILAN, town, Tennessee, in Gibson County, altitude 420 feet; 21 miles north of Jackson; on the Louisville and Nashville and the Illinois Central railroads. It is in a diversified farming area. Manufactures include fruit and vegetable containers and cottonseed oil. There is a United States arsenal here. Incorporated in 1868, Milan has a mayor and council government. Pop. (1950) 4,938.

MILAN DECREE, an order issued by Napoleon I from Milan, Italy, on Dec. 17, 1807, to check British use of neutral shipping; the British were thus attempting to get their goods onto the continental market, from which Napoleon's Berlin Decree (Nov. 21, 1806) and other edicts had nominally barred them. The Milan Decree fell with particular force on American shipping. (See CONTINENTAL SYSTEM.)

MILAN OBRENOVICH IV and ô-brên'ô-vîch, prince and king of Serbia: Jassy, Rumania, Aug. 22, 1854; d. Vienna, Feb. 11, 1901. He was cousin to Michael Obrenovich III, prince of Serbia, by whom he was adopted on the death of his parents. He was educated in Paris at the Lycée Louis-le-Grand and upon the assassination of Michael in 1868 he succeeded him as Milan Obrenovich IV, prince of Serbia, under a regency headed by Ristić. In 1872, aged 18, he took over the government, retaining, however, the services of Ristić. He carefully balanced political relations between Serbia and Austria and Russia, so strengthening his position that after the Russo-Turkish War (1877-1878) he was able to have Serbia's independence declared and himself proclaimed as Milan Obrenovich I, king of Serbia (1882). He then entered a secret pact with Austria, which increasingly influenced affairs in Serbia, to the rage of the patriots gathering about Milan's hereditary rivals, the Karageorgevich (q.v.) family. He tried to modernize Serbia, but taxes, burdensome conscription laws, the failure of his attack on Bulgaria (1885) turned the public against him, as did his private life and quarrels with Queen Natalie. On March 6, 1889, he abdicated and lived in Paris (1889-1894), his son Alexander succeeding under a regency. Milan returned to Serbia, without resuming the throne, in 1894; officially reunited to the queen, he was given the army as his special charge, and was commander in chief from 1897 to 1900, when his son's marriage to the commoner Draga Mašin caused an estrangement between them. Milan resigned his army post, left the country, and died in Vienna.

MILANES Y FUENTES, mē-lā-nās' ē fwān'tās, José Jacinto, Cuban poet: b. Matanzas, Aug. 16, 1814; d. there, Nov. 14, 1863. He was self-taught, working as a clerk and blacksmith's helper; his tragedy *El Conde Alarcos* (1838) made him famous. His best play was probably *Una Intriga Paternal*. He broke down as a result of early hardships and a long tour in 1848-1849 failed to help him. In his last years he showed only flashes of lucidity. Milanes was the best Cuban writer of his time, with José Maria Heredia (q.v.).

MILAZZO, *mē-lăt'sō*, or **MELAZZO**, Sicily, a fortified seaport city in the province of Messina, on a promontory 21 miles by rail west of Messina. It has a good harbor and carries on a trade in fruit, wine, cattle, fish and sulphur. It has a theatre, a technical school, a library containing over 10,000 volumes, a city hospital; and the building now used as a jail was originally a 13th century castle. Milazzo is the ancient *Mylæ* off which in 260 B.C. the Romans won a great sea-fight over the Carthaginians. Here also Garibaldi, 20 July 1860, with 2,500 men, defeated 7,000 Neapolitans and compelled the garrison to evacuate the fortress. Pop. of commune about 20,000.

MILBANK, Joseph, American philanthropist: b. New York, 1848; d. 7 Sept. 1914. He was the son of Jeremiah Milbank, the millionaire organizer and builder of the Chicago, Milwaukee and Saint Paul Railroad, and at an early age became a director of the road. He inherited, with his sister, Mrs. Elizabeth Milbank Anderson, a fortune of great extent, which he further augmented by his own efforts in banking and railroad enterprises. With his sister he gave the Milbank Memorial Chapel to Teachers' College, and Milbank Memorial Hall to Barnard College, Columbia University; the Jersey City People's Palace; founded a Social Welfare Bureau at a cost of \$650,000; and contributed \$500,000 to the Children's Aid Society. Their benefactions totaled \$5,000,000.

MILBURN, William Henry, American clergyman: b. Philadelphia, 26 Sept. 1823; d. Santa Barbara, Cal., 10 April 1903. At five he suffered an accident which caused partial and finally complete loss of sight. He was educated at Illinois College (Jacksonville, Ill.); in 1843 became a Methodist itinerant preacher; was largely active in the South; and for a time had charges at Montgomery and Mobile, Ala. In 1845 he was elected chaplain of the House of Representatives, and he served as such in 1853, 1885 and 1887. In 1893 he was made chaplain of the Senate. He lectured with success throughout the United States and in 1859 in Great Britain. He was generally known as the "blind preacher." Among his writings are 'Rifle, Axe and Saddle-Bags' (1857); 'Ten Years of Preacher Life' (1859); and 'Pioneers and People of the Mississippi Valley' (1860), all based on his Western experiences.

MILCOM, national god of Ammon (1 Kings xi, 5, 33; 2 Kings xxiii, 13). Other references occur in Jeremiah xlix, 1, 3, and in 1 Kings xi, 7, where the spelling varies slightly but the identity is clear. The name appears to be derived from the West Semitic word *melek*, "king"; although *melek 'am*, "king of the people," is also considered. The name of the deity has not been found in inscriptions and nothing is known of the religion. There is no base for the supposition that human sacrifice was practised by the Ammonites, as it was by the Moabites to their god Molech, which deity is often confused with Milcom. The Ammonites worshiped on the Mount of Olives while the Moabites performed their religious rites in the valley of Hinnom. The Ammonites and their religion disappeared in the migrations and political upheavals which occurred in the districts to the east of the Jordan shortly prior to the Christian era.

MILDEW, specifically, any fungus belonging to the group *Erysiphaceæ*, the powdery or true mildews, and *Peronosporaceæ*, the downy or false mildews; loosely, many plant diseases, especially the rusts and smuts of cereals, and some not of fungous origin; vaguely, molds of any kind upon preserved fruit, clothing, walls or other materials, the origin of which is more or less organic. The powdery mildews develop mostly upon the outside of the host plants, which they enter only by means of their sucking organs of attachment (haustoria). In warm weather they develop innumerable spores upon erect branches and later produce thick-walled resting spores which germinate in the spring. Upon the host plants they usually appear as a sort of bloom, but later they often cause distortion of the leaves and not infrequently the death of the host. Being mainly upon the surface they may be combated with any fungicide (q.v.), and often with sulphur, either in the form of powder or vapor (not burned) evaporated without flame. This method is widely practised in greenhouses. Some of the best known are rose mildew (*Sphaerotheca pannosa*), gooseberry mildew (*S. mors-uvæ*), hop mildew (*S. castagnei*), cherry, pear and apple mildew (*Podosphaera oxycanthæ*), wheat mildew (*Erysiphe graminis*) and grape mildew (*Umicinula spiralis*).

The downy mildews all live within the tissues of the host plant, appearing outside the surface only when producing summer spores (conidia) which usually give a downy appearance to the infected spots. The resting spores are produced internally and make their escape in the following season when the tissues of the host (leaf or other part infected) have decayed. They cannot be combated like the preceding, because of their habit of feeding internally. Fungicides (q.v.) may be applied to prevent attacks, however, and this, together with the destruction of leaves in autumn and general cleanness of the premises, are believed to be the only safeguards. Among the best known and most destructive are Potato rot, blight, or mildew (*Phytophthora infestans*), lettuce mildew (*Bremia lactucæ*), damping-off fungus (*Pythium debaryanum*), downy mildew of the grape (*Plasmopara viticola*), radish mildew, also found on other members of the *Cruciferae* (*Cystopus candidus*), melon and cucumber mildew (*Plasmopara cubensis*) and onion mildew (*Peronospora schleideniana*).

The rusts and smuts which are sometimes called mildews are discussed elsewhere. The mildews, so-called, which appear upon leather, wall-paper, cloth, etc., belong to various other groups. Since they are generally seen only where dampness prevails, especially in cellars and closed rooms or houses, they may be prevented more or less effectually by the adequate ventilation of such places. And having gained a foothold in these places they may be destroyed by liberal applications of whitewash, in which copper sulphate or sulphur have been mixed, or where this cannot be applied, by burning sulphur in the closed quarters. This last remedy may also be used where cloth is attacked. Awnings, sails, etc., should be thoroughly dry before being stored or folded for any considerable time. They may also be soaked in a solution of copper sulphate and then dried. Until this is washed out by rain it will act both as a pre-

ventive of attack and will often save fabrics if not too far gone.

MILE (Latin *mille*, a thousand, a Roman mile being 1,000 paces), a measure of length or distance. The English statute mile, fixed in the reign of Queen Elizabeth, is 1,760 yards. The geographical mile, which is commonly used by the navigators of all nations, is one-sixtieth part of a degree at the equator. In many countries the kilometer now holds the same position as the English statute mile in Britain. The following are some of the principal standards of miles or leagues which are or have been in use in the principal countries of Europe:

Kilometer.....	1,093.6 yards.
Ancient Roman mile.....	1,614 "
Modern Roman mile.....	1,628 "
English statute mile.....	1,760 "
Tuscan mile.....	1,808 "
Ancient Scottish mile.....	1,984 "
Geographical mile.....	2,028.4 "
Italian mile.....	2,028.4 "
Irish mile.....	2,240 "
French posting league.....	4,263 "
Spanish league (judicial).....	4,635 "
French league.....	4,860 "
Portuguese league.....	6,760 "
German short mile.....	6,859 "
Flanders league.....	6,864 "
Spanish league (common).....	7,416 "
German geographical mile.....	8,113.6 "
German (new imperial).....	8,202 "
Old Prussian mile.....	8,237 "
Danish mile.....	8,244 "
Swiss mile.....	9,153 "
German long mile.....	10,126 "
Swedish mile.....	11,700 "

The English statute mile is generally used in the United States.

MILEAGE, a term used in the United States, for fees paid to certain officials, such as members of Congress, of State legislatures, special commissioners and others, for their traveling expenses, at so much per mile. The system has led to gross abuses, each senator and representative estimating for himself the distance he had traveled. There is now a fixed table of mileage. The term mileage was formerly applied in the United States to railroad transportation, sold in tickets good for 1,000 miles of travel. These tickets were issued in book form, convenient for the pocket, and known to travelers as mileage books. In 1903 a system of interchangeable mileage tickets was issued, good for transportation on any one of eight different railroad lines in the Eastern States. Early in 1919 this mileage system was changed, all partly used books recalled and instead there was issued what is known as script, the coupons representing different amounts of money rather than miles. This system was an advantage to the traveler as the script could be used on any of the roads then under control of the Federal government.

MILELLI, Domenico, dō-mā'nē-kō mē-lē'lē ("CONTE DI LARA"), Italian poet: b. Catanzaro, Italy, 1841; d. 1905. He was educated for the priesthood, but finding literature more to his liking turned his attention to writing, which is in subject of a paganish character. He was one of the leaders of the class called *Veristi*. Among his works are 'In giovinezza' (1873); 'Odi pagane' (1879); 'Il rapimento di Elena' (1882); 'Verde antico' (1885).

MILES, George Henry, American dramatist: b. Baltimore, Md., 31 July 1824; d. Thornbrook, Md., 23 July 1871. He was graduated from Mount Saint Mary's College, Emmitsburg, Md., and practised law in Baltimore for several years, after which he devoted himself to literature. In 1850 his 'Mohammed' was awarded the \$1,000 offered by Edwin Forrest for the best drama by an American author. In 1859 he was appointed professor of English literature at Mount Saint Mary's College, where he remained until his death. His works comprise 'Señor Valiente' (1859); 'Christine, a Troubadour's Song' (1866); 'Abu Hassan the Wag' (1868), etc.

MILES, Nelson Appleton, American army officer: b. Westminster, Mass., 8 Aug. 1839; d. Washington, D. C., 15 May 1925. At the outbreak of the Civil War in 1861, he left his business to raise a company of volunteers and enter the army as lieutenant in the 22d Massachusetts regiment. In 1862 he was promoted to the rank of colonel, commanding the 61st New York regiment. He was engaged in the battles of the Peninsula, before Richmond, and at Antietam, and in every battle of the Army of the Potomac, with one exception, until the surrender of Lee at Appomattox Courthouse. He was distinguished in the battles of Chancellorsville, Wilderness, Spottsylvania, Court House, Reams Station, Richmond campaign of 1864 and many other important battles of the war; and, at one time, at the age of 22 was in command of the Second Army corps numbering 25,000 men. He was wounded three times, most severely at the battle of Chancellorsville. In May 1864 he was promoted brigadier-general and in 1865 major-general of volunteers.

At the close of the war he entered the regular army and was commissioned colonel of the 40th United States Infantry, and attained the rank of brigadier-general in 1880 and of major general in 1890. He successfully conducted several important campaigns against the Indians and did much to open up for civilization large portions of the West. In 1874 and 1875 he defeated the Cheyennes, Kiowas and Comanches in the Staked Plains country; he also subjugated the hostile Sioux and other Indians in Montana, driving Sitting Bull across the frontier and breaking up the bands that were led by him and other chiefs. In December 1877, after a forced march over a distance of more than 160 miles, he captured Chief Joseph and his tribe of Nez Percés after a hard-fought battle of four days in northern Montana; in 1878 he intercepted and captured Elk Horn and his band on the edge of the Yellowstone Park. In 1886 he subjugated and forced to surrender Geronimo, Natchez and the band of Apaches that had made a large portion of the Southwest uninhabitable, thus restoring peace and prosperity to Arizona and New Mexico. For his services up to this time he received the thanks of the legislatures of Kansas, Montana, New Mexico and Arizona. Later he settled the Indian troubles in the Dakotas, saving the country from a serious war that had threatened it for years. In 1894 he was in command of the United States troops sent to Chicago at the time of the railroad strike; and in October 1895 succeeded to the command of

the United States Army. In 1898 he conducted the brief campaign in Puerto Rico with ability, taking possession of the island with trifling loss, and in 1901 was promoted to the rank of lieutenant general. In December 1901 he was officially reprimanded for publicly expressing his approval of Adm. George Dewey's report on the charges against Adm. Winfield S. Schley. In 1902 he made a tour of inspection to the Philippines and on his return filed a report which called forth considerable controversy by its denunciation of some of the abuses he had found in the conduct of military affairs there. In August 1903 he was retired from active service. He wrote *Personal Recollections and Observations of General Nelson A. Miles* (1896); *Military Europe* (1898); *Serving the Republic* (1911).

MILES CITY, city, Montana, and Custer County seat, situated on the Yellowstone River, at the mouth of the Tongue River, at an altitude of 2,364 feet, 140 miles east-northeast of Billings, and served by the Northern Pacific and the Chicago, Milwaukee, St. Paul and Pacific railroads and a municipal airport. Formerly a rough cow country center, the city still carries on an extensive trade in cattle, sheep, and horses. It has gas wells nearby and manufactures flour, leather goods, and saddles.

It has a Carnegie library, and a small museum with relics of range days. Fort Keogh, rebuilt in 1877 and now used as a livestock experimental station, is nearby. Settled and incorporated in 1876-1878, the city was named for Gen. Nelson A. Miles. Pop. (1950) 9,243.

MILES GLORIOSUS, mī'lēz glō-ri-ō'sūs (Lat., braggart soldier). (1) A comedy by Titus Maenius Plautus. (2) The name slyly applied by Ferdinand I of Bulgaria at a banquet when toasting Kaiser Wilhelm II of Germany who mistook it for a compliment.

MILESIAAN TALES, a form of anecdotal satire current in Miletus and Asia Minor about one hundred years B.C. The original tales were written by Antonius Diogenes and were of an erotic and obscene character. They are important in so far as they form a link in the chain of the development of satirical romance, exemplified in Gaius Petronius' *Trimalchio's Supper* and Lucius Apuleius' *Story of Cupid and Psyche*. Six volumes of the tales were collected by Aristides of Miletus and were later translated into Latin by Lucius Cornelius Sisenna (120?-57 B.C.), but of these only fragments remain. They have been compared to the French *fabliaux* and the tales of Giovanni Boccaccio.

Bibliography—Müller, Theodore, *Fragmenta Historiarum Graecorum*, vol. 4 (Paris 1841-51); Bücheler, Franz, his small edition of Petronius (Berlin 1882); Peck, Harry T., tr. Petronius' *Trimalchio's Dinner* (New York 1913).

MILESIAANS, mī-lē'shānz, (1) the inhabitants of Miletus; (2) in *Irish mythology*, the early colonists of Ireland, a portion of whose inhabitants, according to Irish tradition or legend, are descended from Mileadh, a fabulous king of Spain, whose three sons, Heremon, Heber, and Ir, conquered the island about four hundred years before Christ, establishing a new nobility. This was the fourth and last of the traditional prehistoric colonizations of Ireland.

MILETUS, mī-lē'tūs, ruined city, Asia Minor, now in the vilayet of Aydın, opposite the mouth of the Menderes on the Latmic Gulf. The Ionians are said to have taken forcible possession of the town about 1100 B.C., massacred the Carians living there and taken the women as their wives. The extent of the four harbors of Miletus, one of which could contain a large fleet, soon raised the town in the hands of the Ionians, to a place of importance, and it became one of the first cities and republics of the 12 Ionian Cities, in Asia Minor. Its commerce covered the Mediterranean and extended to the Atlantic. It had upward of 75 colonies, most of which were on the approaches to the Black Sea. It was also distinguished as a seat of literature.

On the rise of the Lydian kingdom repeated attempts were made to conquer Miletus. It finally recognized the sovereignty of Croesus, and paid tribute. A similar arrangement was made with Cyrus in 546 B.C., which saved it the calamities of a contest with the Persians. The city revolted against the Persians in 499 B.C., and was taken by storm five years later, plundered, and the inhabitants massacred or transported. It recovered its independence in 479 B.C., after the Persian defeat at the Battle of Mycale. It yielded for a time to the supremacy of Athens but ultimately threw off the yoke in 412 B.C., only to fall under the Persians again.

Miletus was conquered by Alexander the Great in 334 B.C., but he did not interfere with its government. From the time of its subjugation by the Persians it had never recovered its early importance, but it still continued to enjoy some commercial prosperity under the Romans until the time of St. Paul, who visited it during its final decline, as recorded in Acts 20:17 and II Timothy 4:20. It was finally taken and destroyed by the Turks.

MILFOIL. See YARROW.

MILFORD, mīl'fērd, town, Connecticut, in New Haven County, at an altitude of 10 feet, on the Housatonic River and Long Island Sound, about 9 miles southwest of New Haven, served by the New York, New Haven and Hartford Railroad and state and federal highways. The town is in an agricultural area engaged in oyster growing, seed raising, and dairy, poultry, and truck farming, and has manufactures of brass fittings, automobile and boat hardware, electric motors, garters, suspenders, earmuffs, rubber substitutes, locks and novelty jewelry, rivets, screws, and machine products. Known since the 17th century for its shellfish, it has thousands of acres of undersea oyster beds. The site was purchased from the Indians and settled in 1639, and the town was incorporated in 1640. It has council-manager type of government. Pop. (1950) 26,870.

MILFORD, city, Delaware, in Kent and Sussex Counties, situated on the Mispillion River at an altitude of 20 feet, 18 miles south of Dover, on the Pennsylvania Railroad and modern highways. It is in a fertile truck and fruit farming area, has canneries, a poultry processing plant, boat yards, and manufactures of dental supplies, fertilizers, bricks, wood products, and woolen yarns. The town was established in 1787 on the site of plantations settled in 1680 and was incorporated in 1867. It has a mayor, council and city manager. Pop. (1950) 5,179.

MILFORD, town, Massachusetts, in Worcester County, at an altitude of 257 feet, 16 miles east-southeast of Worcester, on the Boston and Albany and the New York, New Haven and Hartford railroads. It is in an agricultural region, but has industrial interests. There are shoe factories here, and granite quarries are located nearby. The local pink granite has been used in the Boston Public Library, the Corcoran Art Gallery in Washington, and the Grand Central and Pennsylvania stations in New York City.

Milford was originally settled in the 1660's and was part of the town of Mendon. In 1780 it was separated from Mendon and incorporated as a municipality. Town meetings, held usually twice a year, administer the government. Pop. (1950) 15,442.

MILFORD, town, New Hampshire, in Hillsboro County, situated on the Souhegan River at an altitude of 271 feet, 11 miles west-northwest of Nashua, and served by the Boston and Maine Railroad. It is in a fertile agricultural region producing apples, peaches, grain, timber, and granite. It has woodworking and stonecutting plants, and manufactures woolen goods, cotton and jute, and paints. There are granite quarries nearby. The district was settled in 1738 and the town was incorporated in 1794. It was formed from tracts ceded by several other towns in its vicinity. Its government is by a board of selectmen. Pop. (1950) 4,159.

MILFORD, borough, Pennsylvania, seat of Pike County, situated on the Delaware River at an altitude of 503 feet, 47 miles east of Scranton and 7 miles southwest of Port Jervis, N. Y., where it is served by the Erie Railroad. It is located in a portion of the Delaware Valley noted for its beautiful and picturesque scenery, with mountains, woods, and river. First settlement on the site was made in 1733 by Tom Quick. Some years later Quick was killed by an Indian in sight of his son, who spent the rest of his life avenging his father's death, killing indiscriminately a total of 99 Indians. There is a monument to Tom Quick in Milford. The town was laid out in 1796 and incorporated in 1874. Its government is administered by a borough council. Pop. (1950) 1,111.

MILFORD, Engagements at. Milford, Va., on the east bank of the south branch of the Shenandoah, was the scene of several skirmishes and three cavalry engagements during the Civil War. On June 24, 1862, detachments of the First Maine and First Michigan cavalry attacked about 300 mounted Confederate infantry at the place, without decisive result, and withdrew.

When Gen. Philip N. Sheridan, after the Battle of the Opequon (q.v.), followed Gen. Jubal Early up the valley, he ordered Gen. Alfred T. A. Torbert, commanding the cavalry, up the Luray Valley, to get past Early's right and cut off his retreat. Gen. James H. Wilson's division advanced and on Sept. 21, 1864, attacked Gen. Williams C. Wickham's cavalry division of two brigades and drove it from Front Royal (q.v.) and up the valley to Milford, where Wickham took up a strong defensive position on the south side of Milford Creek. When Torbert came up on the 22d he concluded that the position was too strong to be attacked, and fell back to near McCoy's Ferry, again advancing, and on the 23d

occupying Milford, which had been abandoned by Wickham. Sheridan was greatly disappointed by Torbert's failure to carry the place on the 22d.

After the battle of Cedar Creek (q.v.), Oct. 19, 1864, Milford was occupied by Gen. Lunsford L. Lomax's Confederate cavalry division, and its defenses strengthened. On October 24, Gen. William H. Powell's cavalry division, two brigades of about 1,100 men, with six guns, moved up the Luray Valley to reconnoiter. Powell skirmished with Lomax's outposts on the 25th, and on the morning of the 26th attacked Lomax in position at Milford, using his artillery freely, and continuing the contest until 2 P.M. when, finding the defense so stubborn and the position too strong to be carried, he withdrew.

MILFORD HAVEN, MARQUIS OF. See BATTENBERG, LOUIS ALEXANDER.

MILFORD HAVEN, urban district and seaport, Wales, in Pembrokeshire on the celebrated Milford Haven, one of the safest, deepest and most capacious harbors in Britain, forming a deep indentation in the southwest coast of Wales. The haven stretches about 12 miles from east to west, with a breadth of from one to two miles and branches off into numerous bays, creeks, and reaches. The largest vessels can enter and put to sea in any wind or at any tide more expeditiously than from almost any other large harbor in Great Britain, and it has long been proposed to make Milford the eastern seat of the transatlantic trade as bringing London nearer by several hours. The haven is defended by fortifications.

Henry II embarked at Milford Haven in 1171 on his way to the conquest of Ireland, and here Henry Tudor (later Henry VII) landed in 1485 in his successful effort to dethrone Richard III. The town of Milford Haven on the north shore eight miles northwest of Pembroke and six miles from the mouth of the haven, has extensive modern docks. It is a fish-curing station, and the headquarters of a trawler fleet. Pop. (1951) 11,717.

MILHAUD, mē-yō', **Darius**, French composer: b. Aix-en-Provence, Sept. 4, 1892. He entered the Paris Conservatory in 1910, studying under Vincent d'Indy, André Gedalge, and Charles M. Widor, and as a student, besides winning prizes in violin, counterpoint, and the fugue, composed numerous pieces for a string quartet, sonatas, ballet, incidental music to the *Oresteia* trilogy of Aeschylus, and a musical novel, *Le Brebis Égaré*, with the text by Francis Jammes. In 1917-1919, as an attaché in the French legation at Rio de Janeiro, he made the acquaintance of the poet Paul Claudel, who later was the librettist of most of his operas. Milhaud returned to Paris in 1919 and there associated with Arthur Honegger and others who came to be called "Les Six." He came to the United States in 1922 where he gave recitals and lectured at Harvard, Columbia, and Princeton. In 1940, after the fall of France, he came to the United States again and taught at Mills College, Oakland, Calif. In 1947 he was made professor of the Conservatory of Paris.

A prolific composer, Milhaud has used numerous thematic motifs in his work, achieving effect through the use of jazz and South American rhythms, and through polytonal passages. His works, though brilliant, are uneven, some being

too purely intellectual in approach and others too trivial for critical appreciation. His great works, such as the opera *Christophe Colomb* (1928; libretto by Claudel) and the incidental music for Claudel's drama *L'annonce fait à Marie* (1934), show a deep religious feeling and a rich polytonal harmony. His other important works include the ballets *L'Homme et son Désir* (1918; performed 1921), *Le Boeuf sur le Toit* (1919), *La Création du Monde* (1923), *Salade* (1924), and *Le Train Bleu* (1924); the operas *Les Malheurs d'Orphée* (1926), *Pauvre Matelot* (1926), and *Medée* (1938); music for the films *Madame Bovary* (1934) and *Mollénard* (1938); and many other pieces for orchestra, voice, pianoforte, and violin. He also introduced the *opéra à la minute*, a short dramatic scene, in the 1927 compositions, *L'Enlèvement d'Europe*, *L'Abandon d'Arian*, and *La Délivrance de Thésée*.

MILIARIA, mil-i-ā-rī-ā (variations MILITARY FEVER, MILLET-SEED RASH, PRICKLY HEAT), a very common fine papular or papulovesicular eruption. It is caused by too profuse sweating attended by undue congestion of the skin. Hot weather, excessive clothing, vigorous exercise, and alcoholic dissipation commonly evoke the disease, especially in those who are debilitated or who have a delicate skin. It may appear and disappear rapidly without any apparent cause. Its appearance is attended by pricking, burning, or itching sensations. It is generally limited to a portion of the trunk, but may appear upon the face, neck, and extremities.

MILIC, mī'lēch, Jan (known as Milč of KREMSIER), Moravian reformer: b. Kremsier, Moravia; d. Avignon, France, June 29, 1374. He entered the Roman Catholic priesthood in 1350 and in 1360 became canon at the cathedral in Prague. Becoming convinced of the hollowness of court and church life, in 1363 he resigned and began to preach to the lower classes in Prague in their own tongue, instead of the usual Latin, and gained over them a wide influence. Convinced that Antichrist had arrived and that the day for reform was at hand, he went to Rome in 1367 that he might consult the pope and was instead arrested by the Inquisition. He was released and well received by Urban V, and upon his return to Prague resumed his preaching, but in 1372 he was accused of heresy by his brother priests and summoned to Avignon for trial. He proved his innocence, but died before the verdict was rendered. He is regarded as one of the immediate forerunners of John Huss and the Reformation.

MILITARISM, mil'i-tā-riz'm, a term applied to the policy of giving to military training and exploits disproportionate prominence in a nation's affairs and the resulting subordination of civil authority; or the maintenance of a government by military force. The term is used chiefly in connection with the vast armaments maintained by European countries; and has come in particular to mean the preparation, as in the case of Germany prior to the beginning of World Wars I and II, of a vast force maintained not for purposes of national defense but for those of imposing at pleasure the will of the powerful nation upon those weaker and less well armed. It carries in its train the extremist theories of war as a necessity to the proper development of a nation's material and spiritual welfare.

MILITARY AERONAUTICS. Ever since the early days of aeronautics, which began with the development of the old spherical balloon, the use of aircraft in time of war has been a fruitful theme for discussion. Lighter-than-air craft began to figure prominently in warfare soon after their invention in the latter half of the 18th century. The French used a military balloon at the Battle of Fleurus on June 26, 1794, and from that date until after the South African War, over a century later, the aerial machines employed for purposes of observation were either captive balloons attached to winches, or man-lifting kites, or they were free balloons which drifted at the will of the winds that blew. In the Franco-Prussian War, during the siege of Paris alone, as many as 66 balloons left the stricken city, carrying 60 pilots, 102 passengers, 409 carrier pigeons, 9 tons of letters and telegrams and 6 dogs. Gaston Tissandier (1843–1899) at the time went over the German lines and dropped 10,000 copies of a proclamation addressed to the soldiers, asking for peace, yet declaring that France would fight to the bitter end. In the American Civil War an aeronaut named La Fontaine went up in a balloon over an enemy camp, made his observation, rose higher into the air and succeeded in getting into a crosscurrent, which carried him back to his own lines. The first cross-channel flight was made by balloon in 1785, by François Blanchard (1753–1809), who had with him an American doctor named John Jeffries (1744–1819), together with a large supply of provisions, ballast and oars. With the development of dirigible balloons in the closing years of the 19th century and the advent of the airplane a few years later, the spherical type of balloon fell into disfavor as an auxiliary in war, even for observational purposes. Captive balloons, however, were used with some success in this capacity by the French in the colonial campaigns, and also on the western front during World War I. In World War II captive "barrage" balloons were used chiefly in aerial defense, especially in London, where considerable numbers of them supported cables designed to intercept bombing squadrons (see *Military Lighter-than-Air Craft*). In the article Aeronautics are described the development, construction, advantages and limitations of the several types of aircraft—the spherical balloon, kite balloon, dirigible, nonrigid, semirigid, and rigid types, the airplane, and the helicopter. This article deals only with the development of special military types and their adaptability to the tasks for which they were designed.

Uses and Types.—The use of aircraft in World War I began with the exchange of harmless revolver shots between French and German aviators on reconnaissance. At the end of the First World War, the airplane's military uses had grown far beyond reconnaissance and included the bombing of cities, the strafing of ground troops, and formation combats instead of isolated dog fights. World War II

saw multiplication of the duties of military aircraft as well as a great increase in the airplane's effectiveness and importance. The United States Army Air Forces (AAF) grew to tremendous proportions, and the country soon became the greatest air power in the world. By Jan. 1, 1945, the AAF included 2,359,500 officers and enlisted personnel. Besides increasing in size, the AAF now operated a large number of aircraft types which merged into one another, making only approximate classification possible:

(1) The heavy bomber for strategic operation undoubtedly dealt the Germans the heaviest blow of the war and paved the way for the invasion of Normandy. While the British Royal Air Force (RAF) specialized in night attacks, the AAF undertook daytime precision attacks on German oil plants, aircraft and aircraft engine plants, industrial targets generally (which gave Germany its war potential), and on airdromes, railroads, bridges, canals and other means of communication. During 1944 American squadrons, mostly heavy bombers, such as B-17 Fortresses and B-24 Liberators, dropped 937,698 tons of bombs over Germany. In the war against Japan, the heavy bomber remained supreme, only now the aircraft employed were much larger, of greater bomb-carrying capacity, and had longer range. By the middle of 1945 loads of more than 4,500 tons of bombs were being dropped on Tokyo and other Japanese cities in the course of single attacks made by fleets of 550 Superfortresses or B-29's, which made nonstop flights of 15 hours to reach their distant targets. The master plan of wrecking Germany from the air was followed and developed in attacking Japan with increasing intensity. It should be noted, however, that whereas in attacking Berlin and the Ruhr, the heavy bombers unloaded for the most part heavy penetration or fragmentation bombs, with incendiaries to follow; in the war on Japan the emphasis was on lighter but much more numerous incendiaries.

(2) In addition to the heavy bombers, the AAF employed medium and light bombers and attack bombers, whose duties vary between the semistrategic and the tactical. Bomber designations changed as the war progressed. Thus the Fortresses and Liberators, once classified as heavy bombers became medium bombers with the advent of the Superfortresses. The lighter bombers whose objectives were railroad and canal traffic in northern France and Belgium carried the designation A. Army aircraft generally have both a letter designation and a striking name. Thus the Martin A-30 is termed the Baltimore and the Douglas medium or light bomber A-24 is designated the Dauntless.

(3) The letter P stands for pursuit, although pursuit planes were later called fighters. These machines, used for the protection of our own bombers, for attack on enemy bombers, or for combat with enemy pursuits, include such famous craft as the Lockheed P-38, or Lightning; the North American P-51, or Mustang; and the Republic P-47, or Thunderbolt, which supercharged heavily and proved most effective at high altitudes.

(4) Reconnaissance, whether visual, artillery or photographic, remained one of the most important functions of military aviation, and the AAF employed for this purpose such types as the Vultee O-49 or Vigilant, and the Lockheed O-56 or Ventura. Because their primary duties

were in reconnaissance these planes were less heavily armed than the pursuits.

(5) The L- or liaison type came to the fore in the war in Taylorcraft, Aeronca and Piper machines, being small airplanes of the type previously used for private flying, converted to messenger or liaison service. They were lightly armed, but exceedingly useful in liaison work and in local or detailed observation.

(6) The symbol T stands for training. But it is impossible to take a man, give him introductory or elementary training on a small, rather slow airplane and expect him to be ready for training work in a heavy bomber or a fast pursuit. Therefore, training planes are now divided into PT- BT- and AT-types, that is to say primary, basic and advanced trainers.

(7) A category which was unknown in the First World War rendered great service in the Second World War, carrying medical supplies, ammunition, food, and even light tanks to distant fighting areas. Some of the C-type, or cargo aircraft, were converted civil aircraft which on conversion were given military initials or designations. Thus the Curtiss CW-20 became the C-46 and was called the Commando. On army duty, the Lockheed Constellation, a gigantic and speedy transport aircraft, became the C-69. This system of nomenclature was adopted in the middle 1920's and stood the test of time, even though it had been strained by the development of so many new military functions. In addition to the above basic designations a number of other letters came into use, indication of the extent and variety of AAF equipment. G-craft were gliders, which towed in great number behind cargo or other large aircraft were instrumental in a new type of tactics. R stood for rotary wing aircraft, the helicopter having become a recognized military aircraft. It should be added that the symbol X indicated that the plane was experimental, and that Y denoted service test aircraft. The dropping of these letters indicated that the plane was in production, while a higher number following the letter designation generally indicated a more advanced or at any rate a later type.

Strategy and Tactics.—A remarkable account of the strategic and tactical operations undertaken by the AAF was given in the *Official Guide to the Army Air Forces*. It was shown, first, that our combat operations fell into two major categories—strategic and tactical. While it had been conclusively shown that strategic operations would not in themselves win the war, their contribution to victory was later universally recognized. Tactical operations were intended to achieve air supremacy, to destroy or disrupt enemy communications, and to work in co-ordination with ground forces. The efficacy of tactical operations was proved again and again in the invasion of France, in subsequent operations in northwest Europe, and earlier in Africa and Italy. However, as the devastating air assault upon Cassino, Italy, proved, even a complete local victory seemed unattainable by air power alone. In the First World War it was the Germans who first introduced formation flying, which proved effective and deadly until our own and allied aviators abandoned the notion that formation flying was unchivalrous. Formation flying became a science in itself, with a variety of well-tried formations in use. The components of formation became clearly defined:

an "element" consisted of 2 to 4 aircraft; a "flight" was composed of 2 or more elements; a "group" meant 2 or more flights; and a "combat wing" designated 2 or more groups. Heavy bombing from great altitudes has become possible partly because of improvement in engine supercharging, oxygen equipment, and the pressurization of cabins, and partly because of precision bombsights and automatic pilots. The Second World War evolved the synchronized bombsight, which with data inserted by the bombardier determines the point in space at which a bomb must be launched to hit a specific target. The American bombsights were the admiration of our British allies and the envy and horror of the Germans. Low-level bombing was also developed to a high degree of efficiency, and low-altitude and so-called skip bombing proved extremely effective in attacks on enemy shipping. Fighter-bombers proved versatile and effective in combining the functions of the bomber and the fighter as required. Formation fighting made it possible to concentrate an enormous fire power on the enemy. In air defense flexible and highly effective mobile defense systems were developed with interceptors for both day and night attack on the bomber. The Northrop Black Widow proved to be an excellent night interceptor, when specially equipped with radar for such work. A totally novel form of military aviation sprang up in the form of airborne warfare. In some cases paratroopers jumped from transports. On other occasions, towed gliders were released out of which numbers of men darted, fully equipped and ready to function as a unit, supported if necessary by a tank or a light field gun. Airborne troops, whether paratroops or men carried in gliders, proved highly useful. The Germans took the lead in this type of warfare, and in 1941 succeeded in landing many troops in Crete in spite of the fact that the British had almost complete command of the surrounding seas.

Military Lighter-than-air Craft.—In the First World War the captive balloon had great importance, and notwithstanding the supremacy of the airplane, still had many advocates. The great advantage of the captive balloon was that the observer remained constantly in direct telephonic communication with artillery commanders and could observe enemy positions and movements with the aid of powerful glasses. Captive balloons were placed from two to four miles behind the front, and were separated by intervals, the size of which depended upon the artillery activity in various sectors. These balloons, while they rendered real service, were particularly vulnerable, and they seem to have disappeared as a means of observation in the Second World War. On the other hand, barrage balloons, held captive by long wires and raised aloft over cities as a means of protection against enemy bombers were employed in great numbers over London and other cities, and undoubtedly proved highly useful as a defense measure. In the United States captive balloons of great size developed, capable of operating at enormous altitudes, well over 10,000 feet in some cases.

The military airship was formerly used extensively for night scouting, bombing, and to some extent for transportation of military personnel. Hundreds of airships, or dirigibles from small blimps about 180 feet long to the huge Zeppelins 700 feet long, were used in the First

World War. The blimps were used mostly for coastal patrol and for convoying ships, while the large dirigibles were used primarily for bombing.

Three types of dirigibles were employed: (1) the rigid, (2) the semirigid, and (3) the nonrigid. Rigid dirigibles, which included all large types, had frame structures. The nonrigid type depended on gas pressure for maintenance of its form, and could be easily deflated and transported. The semirigid dirigible had an intermediate type of construction. The French found their semirigids useful for reconnaissance, while the Germans used their large rigid Zeppelins with real effect in raids on London during the First World War. But with the development of antiaircraft fire, and the attainment of far greater speed by the airplane, military airships became obsolete. Yet as indicated in the article on AERONAUTICS, small blimps played a very useful role in coastal patrol and submarine warfare off the shores of North America. There still remain advocates of the large airship who maintain that it would make possible long-range reconnaissance over the vast waters of the Pacific.

Equipment and Accessories in Military Aviation.—The growth of military aviation has not been due solely or even mainly to the development of the airplane itself. It owes much to a thousand and one devices or appliances or accessories or methods of armament. Some of these devices are described in the article on AERONAUTICS. The following may be said to have special military interest:

(1) Jet propulsion—perhaps one of the greatest single developments recorded during the Second World War. The introduction of jet propulsion and the elimination of the propeller gave the pursuit airplane an extra 100 miles an hour, with the ultimate possibility of flying faster than the speed of sound. Had the Germans been able to build their jet-propelled aircraft in greater numbers, they would have seriously challenged Allied air supremacy on the western front.

(2) Rockets, utilized both in military and naval aviation to facilitate the take-off of heavily loaded aircraft.

(3) The great development of the supercharger, the pressurized cabin, and other devices which permitted bombing operations at altitudes of well over 40,000 feet.

(4) Self-sealing and droppable fuel tanks which lessened the danger from enemy fire, and also greatly increased the range of fighters acting as escorts.

(5) Remarkable improvements in the electrical control of gunfire, which allowed the simultaneous firing of many guns located at various points of the airplane, with concentration on a single target when required.

(6) The Sperry mathematical gunsight and fire control, which proved to be one of the mechanical and electrical miracles of the war. In combat, during which the combined speed of two airplanes may exceed 1,000 miles an hour, correct aim by visual and manual methods became impossible. The Sperry device, by a combination of optics, electronics, and mathematical integrating and computing machinery, permitted far greater accuracy of fire, and shot at the point where the enemy would be a few instants later rather than at a point where it would not be when the bullet got there.

(7) Power-operated turrets, hydraulic or electrical, and remotely controlled, overcame the difficulty that was inherent in the manual operation of the turret because of the high velocity of the air that flows past an airplane.

(8) The 75 mm. cannon became standard equipment on some models of the B-25, being mounted in the nose of the fuselage with a complete round weighing 20 pounds, and an effective range of about 2,000 yards.

(9) Armor protection against gun fire in the form of steel armor plate, armored suits for men in bombers, and other such armored protection almost but not quite kept pace with the power of the offensive.

(10) In bomber work there was an enormous increase in the weight and size of bombs. The British were the first to introduce the 2-ton and 4-ton bombs, then the deadly 6-ton block busters, and finally an 11-ton bomb used for attacking submarine pens and other enormously strong targets.

(11) The development of radar led to advances in enemy interception, particularly at night, in attacks on submarines, and to other developments. Radar promised to become the civil as well as military solution for blind flying.

(12) The introduction of the rocket-propelled projectile added enormously to the power of the pursuit planes and proved invaluable in amphibious operations.

(13) The German robot bombs might have changed the whole complexion of the war by their deadly long-range operations, for which no defense could apparently be devised other than the destruction of their launching platforms.

(14) Flak, the German word for antiaircraft fire, reached such an intensity of fire during World War II that our aviators, when attacking Berlin, felt that they might be able to walk on the flak.

Post World War II.—The foregoing historical survey of military aeronautics was written after the surrender of Germany had ended the western phase of World War II, but before Japan's defeat was achieved by use of the atomic bomb.

In the decade after World War II military aviation was featured by a development of the use of jet propulsion for almost all types of craft. However, propeller-driven planes continued in production for special uses. Since the founding of the North Atlantic Treaty Organization in 1949 its members have been particularly active in developing their air armaments in competition with those of the USSR and its satellites. Most enterprising in constructing new models were the United States, Great Britain, and France.

Turbojet supersonic fighter aircraft of the U.S. Air Force in 1954 included the North American F-100, McDonnell F-101, Convair F-102, Republic F-103, Lockheed F-104, and Republic F-105. The military use of helicopters, demonstrated in the Korean War, caused production in 1953 of a new Bell Model 47G. The same year saw the launching of the Piasecki YH-16 Transporter, a helicopter with carrying capacity of 40 troops or 32 litter patients.

During the decade the Royal Air Force pioneered in jet development. In 1954 the F.4 Swift and the Hawker Hunter were among British fighters in the 700-mph. category. It was estimated in 1954 that the Soviet Union bomber strength included about 400 of the TuG-75 six-

engine bombers, comparable to the American B-52.

The vast increase in compact, available power, due to development of the gas turbine principle, not only led to speeds in supersonic range but to realization of the old dream of vertical take-off (VTO). The military value of having aircraft which can dispense with airports, flight strips, and even the take-off areas of carrier decks is tremendous. Early in 1954 it was disclosed that in the United States two VTO prototypes were being tested: the XFV-1 by Convair and the XFV-1 by Lockheed. Both were powered by the Allison T-40 turboprop, rated at 5,500 equivalent-shaft horsepower driving two contra-rotating propellers, and required rocket-assisted take-off. They stand at rest in an upright position, or nearly so. The XFV-1 is a straight-wing type, and the other a delta wing. Great Britain and the Soviet Union were also developing VTO prototypes.

MILITARY CAMPS. Twentieth century military camps bear little resemblance to their prototypes of ancient times, when a main function of the installations was protection of troops against enemy attack. First to devote attention to the art of developing military camps, the Greeks adopted a circular layout, as best calculated to give the commanding general a view of his whole camp from the center and to dispatch assistance to any part of the camp that might be attacked. The Romans, during the whole period of their domination, used a square layout surrounded with a ditch (*fossa*) and a rampart (*vallum*) for protection against enemy attack, and this form was generally retained down to the time of the invention of gunpowder.

When entrenched camps lost significance because they provided no protection against gunpowder-propelled projectiles shot from long ranges, it became necessary to keep the mass of the army, when not actually engaged, at a considerable distance from the fighting line and to select sites beyond enemy reach. The selection of sites for the modern military camp assumes great importance largely for other reasons than protection against the enemy.

The large armies to be trained and the extent of land area required to support training in the use of modern weapons have a major impact upon local and national economies and upon natural resources which must be tapped to provide structures and facilities for the training of ground troops and airmen. The effect upon local economy can be imagined from the fact that the land acquired—and therefore re-

moved from the tax rolls—for some types of training runs to more than 100,000 acres, sometimes several hundred thousand acres. Thus, one modern camp in the southeastern United States, employed for the training, housing, and support of 70,000 troops during World War II, occupies more than three times the land area of Washington, D.C.

The necessary use of large quantities of lumber and other building materials, water from underground or surface supplies, and fuels of various kinds, requires detailed study by military authorities in the selection of sites and in the planning of camps with a view to rigid economy of original construction and ease of maintenance and operation. For these reasons, rigid site-selection criteria are established which must be met by survey teams in the selection of sites and with a view to avoiding areas where climatological conditions are such as to prevent daily, continuous, efficient use of the installations; where accessibility is inadequate due to deficient transportation facilities; where local labor supply and sources of construction materials are lacking or insufficient; where conflict with other military installations would occur (as where firing from an artillery range would endanger air traffic from a nearby air installation); where the provision of an adequate supply of water and electric power and of means of sewage disposal would be excessively costly; where land acreage adequate for the types of use to be made of the camp is not available at moderate expense; or where land acquisition would impose an inequitable burden on the community (as in the condemnation of dairies or profitable farm land).

Economy in continuing maintenance and operation is sought by means of careful site planning to provide the most compact layout consistent with operational efficiency. By this means, it is feasible to make the most economical use of available training time by avoiding traffic jams, circuitous routing of troops from housing to training areas, and excessive travel by service units responsible for the camp's "housekeeping." Military authorities provide standard layouts for various types of installation, based on the most economical arrangement of buildings, roads, and utilities, for use as a guide to planners and construction agencies. These standard plans are then carefully adapted to the topography of the site selected, so that costly grading operations and foundation difficulties due to ledge outcrop, swamp, or other unfavorable soil conditions will be avoided.

Uses to which military camps were put during World War II include divisional camps with populations from 30,000 to 70,000 men for the training of infantry, armored, and airborne troops; and airfields, antiaircraft firing centers, reception centers, replacement training centers, staging areas (up to 10,000 troops destined for overseas areas), prisoner-of-war enclosures (1,500 to 3,000 enemy prisoners), and Women's Army Auxiliary training centers. In support of the above, other kinds of installations required are various types of depots used in the packing, storing, handling, distributing, holding, and reconsigning of all kinds of food, clothing, equipment, and ammunition; and hospitals up to 1,250 beds at camps and up to 1,750 at separate sites.

LEON ZACH,

Office of the Chief of Engineers, Department of the Army.

MILITARY COURTS-MARTIAL, special tribunals established as instrumentalities for the enforcement of military discipline within the armed forces of nations. The history of military jurisprudence may be traced back to a period earlier than the Christian era. Based on the practices of the Romans, the most powerful of the military nations of antiquity, court-martial systems suitable to the feudal era were adopted during the Middle Ages. By the time of the Norman Conquest such systems had been established on the continent of Europe, and in the 11th century a court-martial system was introduced into England by William the Conqueror.

The sources of the modern court-martial systems of the English-speaking nations, and to a limited extent of other nations, were a British code of regulations known as the Articles of War (q.v.), issued by James II in 1686, and the first Military Act of 1689 which was statutory in character. These two bodies of law, as amended, were in force at the time of the American Revolution and were well known to the colonists. Hence, at the outbreak of the revolution they were adopted by the Continental Congress for the government of the armies of the United States. From these two 17th-century English bodies of law have evolved, after many modifications, the present court-martial systems of the British Commonwealth of Nations and the United States.

United States.—The basis of military jurisdiction in the United States includes the Constitution and international law. International law includes the laws of war. The specific provisions of the Constitution relating to military jurisdiction are found in the powers granted to Congress, in the authority vested in the president, and in a provision of the 5th Amendment. While courts-martial have no part of the jurisdiction set up under the article of the Constitution which relates to the judicial power of the United States, they have an equally certain constitutional source. They are established under the constitutional power of Congress to make rules for the government and regulation of the armed forces of the United States, and they are recognized in the provisions of the 5th Amendment expressly exempting "cases arising in the land and naval forces" from the requirements as to presentment and indictment by grand jury.

The present court-martial system in the military establishment was prescribed by an act of Congress entitled "an act to unify, consolidate, revise, and codify the Articles of War, the Articles for the Government of the Navy and the disciplinary laws of the Coast Guard, and to enact and establish a Uniform Code of Military Justice," approved May 5, 1950 (64 Stat. 107); and under authority of this act, the president issued Executive Order 10214, which prescribed the *Manual for Courts-Martial, United States, 1951*. This system came into force and effect in the armed forces on May 31, 1951.

The American court-martial system has incorporated in it all the basic principles of Anglo-Saxon criminal jurisdiction, with emphasis on the protection of the rights of accused persons. Courts-martial are temporary bodies and in this respect contrast with civil courts which are created by statute and become permanent institutions of the state. They are appointed by military commanders from time to time as required. Whereas the civil courts operate independently of the executive power of the civil governments,

courts-martial are in the last analysis instruments of command, to be utilized only when necessary as one of the means of maintaining military discipline.

Classification and Composition.—Courts-martial are classified as general, special, and summary courts-martial. Any officer on active duty with the armed forces is eligible to serve on courts-martial. Any warrant officer on active duty with the armed forces is eligible to serve on general and special courts-martial for the trial of any person other than an officer. Any enlisted person on active duty with the armed forces is eligible to serve on general and special courts-martial for the trial of any enlisted accused who has personally requested in writing, prior to the convening of the court, that enlisted persons serve on it. General courts-martial consist of a law officer and any number of members not less than five. The law officer is not a member of the court. Special courts-martial consist of any number of members, not less than three. Summary courts-martial consist of one officer.

Jurisdiction.—The jurisdiction of courts-martial is entirely penal or disciplinary. They have no power to adjudge the payment of damages or to collect private debts. The jurisdiction of courts-martial does not, in general, depend on where the offense was committed nor is it usually affected by the place where the court sits. Courts-martial have exclusive jurisdiction of purely military offenses. But a person subject to the code is, as a rule, subject to the law applicable to persons generally, and if by an act or omission he violates the code and the local criminal law, the act or omission may be made the basis of a prosecution before a court-martial or before a proper civil tribunal, and in some cases before both. General courts-martial have power to try any person subject to the code for any offense punishable by the code. In addition, they have the power to try any person who, by the law of war, is subject to trial by military tribunals for any crime or offense against the law of war and for any crime or offense against the law of territory occupied as an incident of war or belligerency whenever the local civil authority is superseded in whole or in part by the military authority of the occupying power. Special courts-martial have the power to try any person subject to the code for any noncapital offense made punishable by the code and for capital offenses not carrying a mandatory punishment beyond the punitive power of a special court, when so directed by the officer exercising general court-martial jurisdiction. Summary courts-martial have the power to try persons subject to the code except officers, warrant officers, cadets, aviation cadets, and midshipmen for any noncapital offense made punishable by the code.

General Courts-Martial.—A general court-martial may be convened by the president of the United States, the secretary of a department of defense, and by commanding officers of large units, down to and including division commanders and commanders of corresponding units in the navy and air force. The authority convening a general court-martial is required to appoint as law officer thereof an officer on active duty who is a member of the bar of a federal court or of the highest court of a state of the United States and who is certified to be qualified for such duty by the judge advocate general of the armed force of which he is a member. The law officer is not

a member of the court and has no vote in the findings or sentence. His duties are analogous to those of a trial judge in a civil criminal trial with jury, the duties of the members of the court being analogous to those of the jury. In addition to the members and law officer of a general court, one officer must be detailed as trial counsel and one officer as defense counsel with such assistant counsels as the convening authority deems necessary. A person who is appointed as trial counsel or defense counsel of a general court-martial must be a judge advocate of the army or the air force, or a law specialist of the navy or coast guard, who is a graduate of an accredited law school or is a member of the bar of a federal court or of the highest court of a state; or a person who is a member of the bar of a federal court or of the highest court of a state. In addition to this qualification, a person who is appointed as a trial counsel or defense counsel of a general court-martial must be certified as competent to perform such duties by the judge advocate general of the armed force of which he is a member. Also, the accused has the right to be represented in his defense by civilian counsel of his own selection if reasonably available.

The trial counsel's primary duty is to prosecute in the name of the United States; however, any acts on his part (such as the conscious suppression of evidence favorable to the defense) inconsistent with a genuine desire to have the whole truth revealed is prohibited. Immediately upon receipt of charges referred to him for trial he will serve a copy of the charge sheet on the accused and will inform the defense counsel that such copy has been so served. He will permit the defense to examine from time to time any papers accompanying the charges, including the report of investigation and papers sent with the charges on a rehearing. Prior to trial, he should advise the defense of the probable witnesses to be called by the prosecution, and the fact that the defense has not been so advised with respect to a witness who appears at the trial may be a ground for a continuance. He prepares the case for trial and attends to all administrative details such as giving notice for assembly of the court, providing a suitable place for the meeting of the court, and summoning witnesses for the prosecution and defense. Under the direction of the court, he prepares the record of trial.

The defense counsel guards the interest of the accused by all honorable and legitimate means known to the law. He represents the accused with undivided fidelity and cannot divulge his secrets or confidence nor tolerate any manner of fraud or chicane.

The charges against an accused, the equivalent of the civil indictment or complaint, may be signed by any person subject to military law. Charges are submitted under oath as to the truth of the matter set forth. No charge may be referred to a general court-martial until after a thorough and impartial investigation as to the truth of the allegations of wrongdoing and as to what disposition of the case should be made in the interest of justice and discipline. This investigation in military procedure has its counterpart in civil criminal procedure in the grand jury inquiry. At the investigation, full opportunity is extended to the accused to cross-examine witnesses against him if available and to present anything desired in his own behalf either in defense or mitigation. Before trial by general court-

martial, the appointing authority must refer the charges and the report of the investigation to his legal adviser, his staff judge advocate, for advice.

General courts-martial not only have jurisdiction to try any person subject to military law for any crime or offense made punishable by the code, but they also have the power to try any person for any violation of the law of war which may be punishable by military tribunal. An example is the power to try an enemy alien civilian who enters the lines of the United States Army for purposes of sabotage of military installations.

General courts-martial may adjudge any punishment not forbidden by the code, including the penalty of death when specifically authorized by the code. Authorized punishments include dismissal; dishonorable discharge; death; confinement at hard labor; forfeiture or detention of pay; fine; suspension from rank, command, or duty; reprimands or admonition; and restriction to limits. Any cruel or unusual punishments are forbidden. Dismissal is the form of punishment imposed in the case of an officer whose compulsory separation from the service in dishonor or disgrace is intended. Dishonorable discharge accomplishes the same purpose in the case of enlisted persons.

Special and Summary Courts-Martial.—Unlike general courts-martial, special courts-martial do not have a law officer or require trial and defense counsels with legal qualifications. Special courts-martial, which consist of at least three members and an appointed trial counsel and defense counsel, may not adjudge death, dishonorable discharge, total forfeiture or pay, or confinement in excess of six months. They may adjudge a bad conduct discharge. A summary court consists of one officer and no trial or defense counsels. Summary courts may not adjudge death, dishonorable discharge, bad conduct discharge, total forfeitures, or confinement in excess of one month.

Foreign Systems.—Systems of courts-martial in other countries are in many respects similar to that in the United States. With the exception of the Russian system, a basic characteristic of all systems is that the courts are appointed by and function under the responsible military commanders and are distinct from the local civil tribunals. In Russia military tribunals appear to be permanently functioning bodies independent of the military commanders and composed of permanently detailed professional judges. Codes of military law have existed in some form or other in practically all countries ever since armies were maintained and have gone through many revisions. For example, the first modern military courts in France were established after the revolutionary period in 1796. In 1806, Napoleon made many changes to strengthen military discipline, and for the next 50 years many commissions were appointed to revise the existing military code. It was not until 1857 that a comprehensive military code was enacted which provided for the *conseils de guerre* and *conseils de révision*. This code, in effect throughout the World War I period, was replaced in 1928 by the present *Code de justice militaire pour l'armée de terre*, modified in 1932. The court-martial systems of Germany, Switzerland, Italy, and many other countries have all gone through many revisions but still retain the common characteristics that the military commander must approve the sentence before the

sentence can be executed and that the personnel of the court must be members of the military or personnel specially designated for that purpose.

EDWARD M. O'CONNELL,
Lieutenant Colonel, J.A.S.C., Associate Professor of Law, United States Military Academy.

MILITARY EDUCATION AND TRAINING. Organized military education and training are as old as the art of war. That art came into being only after the great captains of ancient days discovered the means and methods for converting the armed mobs which had constituted the earliest armies into cohesive skilled instruments, responding as a unit to the commander's orders. The armies of ancient Sparta, of Macedon under Philip and Alexander, and of Hannibal in turn achieved primacy in their day. In each case, the handicap of relatively small numbers was overcome by the perfection of their development and by the schooled leadership of their commanders. For the great mass of such forces, the schooling was a matter of incessant and intensive training; for the leader it meant self-education, largely acquired in combat. By the time the Roman legion was evolved from the Macedonian phalanx, military training was a fully organized function of the state. Moreover, the writings of the military historians had become texts for ambitious young officers.

The general decadence which in time undermined the strength of the Roman Empire was felt no less by the soldiery than the soft-living civilians of Rome. It was the armed mob, the hordes of Teutonic invaders, that eventually ran over a deteriorated Roman military machine. It was only after the Huns and the Saracens had in turn pointed up the hazard of dependence on the armed mob that attention was again given to the need for sound military training as a safeguard of security. Actually, the efforts got no further for some centuries than the specialized and individual development of a small class of the elite. For this was the day of the mounted knight, supported in combat by a rabble in arms, the knight's retainers. The birth of nationalism and the growing appetite of rulers for other peoples' property were among the factors creating renewed interest in the development of well-trained, maneuverable combat units. Spain's land forces, "the best infantry in Europe," pointed up the issue with their repeated victories. Italy's *condottieri* and the indomitable Swiss levies provided the same kind of argument. In a way, they were the forerunners of the superbly trained forces of Sweden's two greatest captains, Gustavus Adolphus and Charles XII. Their biographers, lauding their genius, rarely take the trouble to point out how far their successes depended on the sound and intensive instruction given their troops before their first test in battle.

In the 18th century, Prussia's Frederick II carried the training principle to its extreme. The soldier was converted into an automaton, one unit in a military mass which functioned in perfect response to the commands of its officers. Even the straggler, overcome by fear, was provided for; the sergeant file-closers shot him down. Any system so stereotyped could be handled effectively only by a genius. There was no genius to lead and direct the Prussians who faced Napoleon at Jena, the Napoleon who had earlier discovered the value of giving free play to the aggressive initiative of his subordinates, even down to the

level of the private. None of his enemies except perhaps the British took counsel from their defeats to apply the Napoleonic principle. Wellington, as it happened, had learned the lesson earlier—and vicariously. Among his most valuable contingents was a special regiment, the King's Royal Rifles, *née* the Royal American Rifles. Recruited from the North American frontier during the colonial wars, they knew every trick of Indian fighting. Moreover, they aimed at—and usually hit—a specific target, violating the European principle of mass volleys directed at an opposing mass, and thus acquiring the unenviable reputation of "murderers."

The argument of human robot versus trained individualist has continued to the present day. Generally speaking, the English-speaking nations have given greatest emphasis to the exploitation of individual initiative and abilities in the development of their armed forces. France has followed the same rule, though not to the same degree. The German armies which came near to overrunning France in 1914 operated largely on the robot principle of training and direction and never quite extricated themselves from the resultant handicap. The Russian troops of World War I, rarely well trained, were too weak in intelligence and education to exploit what little initiative the peasant-soldier boasted.

A new set of conditions came into play between 1914 and 1918, compelling all belligerents to give more and better attention to military training. Each new weapon produced by the technologists demanded a skilled crew for its operation and maintenance. World War II and the postwar years have given tremendous impetus to that trend. Its effect is in fact felt today by the entire civilian educational system, from the primary grades up. Modern airplanes, tanks, guided missiles, and the many varieties of atomic weapons can be utilized to fullest effect only by intelligent, highly skilled personnel. There is in consequence a premium on the alert high school graduate or college youth with something more than a "flair for gadgets." He must understand the scientific principles which make the gadget function, not only to employ it with maximum effect against a target, but in order to make repairs when it breaks down.

World War II, like its predecessor, produced a sweeping reorganization of military education and training in the belligerent nations. The threatened neutrals and certain other neutrals which avoided full involvement soon followed suit. In general, the highest level schools, designed to produce senior commanders and general staff officers, closed their doors; both faculty and student officers were needed for field and staff assignments. At the next lower level, where the regimental commanders and junior staff officers were trained, the length of courses was cut to a minor fraction of peacetime schedules, work hours were heavily increased and facilities were greatly expanded. In addition, officer candidate schools within the arms and services were opened to convert potential officer material into platoon commanders or their equivalent. So great was the demand for these neophytes that course length was held to the barest minimum, often no more than three months. The graduate was expected to absorb most of his military education and training from his exercise of command or in staff experience. In practice, that assumption proved reasonably sound in countries of high educational

standards, proportionately less so in backward states like the USSR and China.

At the enlisted level this telescoping of peacetime training into the irreducible minimum of time went even further. The heavy casualties suffered in the 1939-1941 period by the countries opposing the Axis wiped out most of their professional forces. The need for replacements and the simultaneous expansion of the manpower base made it necessary to send into combat many thousands of inadequately trained men. The turn of the military tide in North Africa in late 1942 and the subsequent build-up for the Allied invasion of the Continent made possible the extension of the training period. United States combat units with the exception of a few National Guard elements in 1942 and thereafter were generally combat-ready. The same cannot be said for individual replacements shipped abroad to be absorbed by combat units. Most of their training was acquired at the front. German forces showed no serious dilution of combat readiness until the heavy fighting on the Eastern front had taken its toll. Deterioration increased in 1943, accelerated in 1944, and reached its climax in 1945. Italy's record followed the same pattern, reaching the point of collapse in 1943. Russia's possession of huge manpower reserves and vast areas beyond the reach of enemy attack enabled her to maintain a flow of unit and individual replacements sufficient first to stave off complete defeat and, after 1942, to permit her to take the offensive.

Canada.—The proven solidarity of the Commonwealth of Nations in facing the military crises of the present century, heightened in recent years by the global threat of Communist aggression, has enhanced the importance of military training in those countries. Canada, strongest in military resources and development except for the United Kingdom, is of special interest. The need for fitting Canada's forces into the joint Canada-United States system for detecting, intercepting, and destroying all types of enemy invasion via the polar routes, as well as for successful integration into the NATO military establishment, make the training problem extremely varied and complex. The sum of such demands is responsible for the great postwar expansion of Canada's peacetime military establishment, embracing three major components, army, navy, and air force, each designation carrying the Royal Canadian prefix. By 1953, the training system, like the weapons and equipment used, was identical with or closely analogous to that of United States forces.

Basic training is given the recruit at one of the camps maintained for that purpose. Having designated the corps (arm or branch) of his choice, he next receives specialized training, including practical work in one or more trades, usually at a corps school. Men who demonstrate high aptitude are trained to become instructors. Rapid advancement through the noncommissioned grades and the opportunity to qualify for a reserve commission are open to men of superior ability. Unit training occupies most of the summer period, culminating in the autumn maneuvers. The winter months regularly include exercises in the Far North, at times in cooperation with United States forces. In recent years they have provided ideal tests for personnel and equipment under extreme weather conditions.

Three schools are maintained to educate

cadet candidates for commissions: Royal Military College of Canada, Kingston; Royal Roads, Vancouver Island; and Collège Militaire Royal de Saint-Jean, St. Johns, Quebec. The Staff College at Kingston is comparable to the United States Staff and Command College, Fort Leavenworth. The National Defence College, also at Kingston, educates selected officers of all armed force components and civilian government officials in matters of national strategy. A student-officer exchange system with United States and British military schools is maintained.

The Royal Canadian Navy has been described as the most specialized among the world's navies in that it is intended to serve almost wholly as an antisubmarine and escort force. That limited but vital role leaves it to other naval forces, particularly those of the United States and Great Britain, to carry out the general purpose functions of the free world defense system. In 1954, some 100 naval craft were available to the RCN.

Basic training for recruits, including drill, seamanship, and the history, customs and traditions of the service, begins on shore. Most of the subsequent training is provided at sea. Ambitious and able youths are selected for training in gunnery, communications, antisubmarine warfare, navigation, radar, ordnance maintenance, engineering, and other specialties. Fleet exercises and training cruises are a standard feature. Participation in the United Nations naval effort in Korean waters and also in recent NATO maneuvers has provided an ideal postgraduate test of competence.

In the past Canada has depended heavily on Britain's naval schools for the training of its commissioned personnel. In the prewar period graduates of the Royal Military Academy could opt for career service in the navy. The best educated and most apt enlisted men are today permitted to qualify for reserve commissions. A comprehensive, indigenous system of officer procurement and education, comparable to that of the army, is undergoing study.

The experience of the Royal Canadian Air Force in operating the British Commonwealth's wartime Air Training Plan and the combat service of some 60 squadrons in World War II provided the base for the recent rapid expansion of the RCAF. Its personnel strength in 1953 was little below that of the army. Training was pushed to assure the early commitment of an air division to the NATO forces in Europe. Voluntary recruitment provides most of the annual intake of personnel. Training and education closely parallel the United States system. A special feature is the development of personnel for service in the Far North, including close cooperation with United States Air Force units in that region.

France.—The enormous task of rebuilding French armed forces from the fragments available in 1945, along with the bankrupt state of the national treasury, seriously handicapped the early efforts to re-establish a sound training program. United States assistance in the form of arms, equipment, and funds overcame the initial handicap. Other obstacles were the infiltration of Communist elements which had largely made up the wartime underground units and the Communist-led rebellion in Indo-China since 1945. Despite these difficulties, France has made notable progress since 1950.

Officer training in the army begins at the interarms school, *L'École Speciale Militaire*, at Coëtquidan. Officer cadets are accepted in approximately equal numbers from the ranks and from civil life. Graduated as commissioned officers, these subalterns round out their basic training in schools of application maintained by the separate arms. Advanced training becomes available to older officers whose records of performance, validated by competitive examinations, qualify them. The ladder of advancement to high command and senior staff positions is roughly comparable to that maintained in the United States, except that France moves faster in selecting, training and promoting outstanding young officers. The top rung is occupied by the Institute of Higher Studies of National Defense, designed to educate senior officers of all components of the military establishment and also outstanding civilian officials and statesmen.

Plans for the training of enlisted personnel are aimed at giving all prospective conscripts two years of preparatory military training, beginning at the age of 17, under the direction of the Ministry of National Education, and a further year under military direction. The latter year covers much of the content of normal basic training. The 18-month period of obligatory service begins at the age of 20. Individual regiments are responsible for the first six months of this training; thereafter the conscripts are assigned to various divisions in continental Europe and French North Africa. A small percentage of the best prospects are selected early for assignment to noncommissioned officer and specialist schools. Most of the men who complete the tour of compulsory service are placed in the active reserve. If qualified for advancement, they may continue in uniform as professional soldiers or become candidates for a commission.

France has long depended heavily on colonial troops to round out her metropolitan nucleus. Some levies, like those of North African peoples, are wholly native in their composition. Others are mixed, with French officers and noncommissioned officers providing needed leadership. Also, one finds special units made up wholly of French residents in colonial areas. Recruitment is on both a voluntary and a compulsory basis. For the most part colonial troops serve in their homeland areas in peacetime. Training, especially for the long service professionals, is rigorous, and has proven its merit on the European and Asiatic battlefields of two world wars.

Since 1948, annual maneuvers have been a standard feature of training. Insofar as funds have permitted, major elements of two or more of the army, air, and naval components have been included.

Both the navy and the air force were handicapped after 1945, even more so than the army, by lack of equipment. By 1953, the air force was overcoming this shortage; the navy, slated for a relatively minor role in the Western defense system, was still using reconditioned prewar shipping. Both of these elements depend in part on voluntary recruitment and in part on conscription for enlisted personnel procurement. Training standards for all ranks are comparable to those maintained by the army.

USSR.—No secrets of the Communist world are more closely guarded than those relating to the armed forces of Russia and her satellites. Enough information, much of it from refugees

escaping from the Iron Curtain area, has become public knowledge to permit sketching the major outlines of the military establishment. The universal military service law of 1939 established compulsory service for all classes of male citizens. Military service for women is not mandatory, but women previously trained along certain technical lines may be called up for military training and service. Physical standards are substantially lower than those prevailing in the Western World, but they are more carefully applied in determining the assignments of the conscripts. During World War II, the military establishment reached a peak strength of about 12,000,000. The quality of the manpower and its training, however, declined during the final two years of the war to the point where much of the army was no more than an armed mob, depending on "human wave" tactics of assault after heavy and prolonged artillery fire had been delivered against the German defenders.

Postwar demobilization provided the opportunity to screen out roughly two thirds of the least effective personnel, leaving a core of about 4,000,000 young, battle-trained men. That level has been substantially maintained since 1947. Extensive retraining of this initial nucleus to convert the ground forces into a modern, mechanized army was a first step. It was some years, however, before adequate equipment became available for the field forces and the training centers charged with development of new conscripts.

Officer material is derived almost wholly from two major sources. The Suvorov schools initiate the education and training of selected boys below the teen-age level, carrying on for seven or more years. Graduates are admitted to officer candidate schools, usually after a period of duty with troops. Enlisted men and civilians are likewise admitted after examination to these schools. Courses vary in length, depending chiefly on the technical requirements of the arm or service for which the candidate is preparing. Graduates are commissioned as junior lieutenants. After a few years of service with his arm, the young officer becomes eligible for admission to an advanced course, designed to prepare him for duties up to the battalion commander level. Thereafter, the selective principle is applied increasingly until only the ablest and best educated are eligible for admission to schools comparable to the various war colleges in the United States. At every level, full political reliability is a major criterion for selection.

Conscripts may be assigned to the army (including the air force), the navy and its air arm, or to the carefully picked MGB internal security troops. Possibly half of the group annually arriving at conscription age are inducted. Most of these have had some prior training, beginning at the age of 15, in the various youth organizations maintained by the government. Periods of compulsory active service range from two to five years, the longer periods being required for technical specialists and men promoted to noncommissioned grade. Men who are exempted or deferred usually receive enough training on a reservist basis to make them available for incorporation into reserve divisions.

The training period covers the entire year, is extremely intensive and realistic, and embraces all the conditions of terrain and climate which an armed force might expect to encounter within the areas controlled by Russia and its satellites.

Combat conditions are closely simulated in all unit exercises, including the large-scale fall maneuvers. Particular effort is made to build up the strength and endurance of the individual and then to put him to extreme tests of his physical and mental reserves.

In the decade prior to World War II, Russia made strenuous efforts to develop an air force comparable to those of the Western powers. Performance during the war indicated that she was far short of that goal as late as 1945. Prospective pilots were largely recruited from paramilitary youth organizations and junior military schools operating throughout the Soviet Union. The greatest single obstacle to effective development was inherent in Russia's technical backwardness, affecting performance at all levels from ground crew maintenance to aircraft operations. Postwar efforts to eliminate these shortcomings through intensive and prolonged education appear to have had some success. Inasmuch as the air arm is divided into three sections, operating severally under the direction of the army, the navy, and the MGB, operational education and training are closely geared to the air support requirements of these separate components.

The development of the Russian navy has long been hampered by a tradition of ineffectiveness and a record of disastrous defeats. An opportunity to break away from that handicap occurred with Russia's seizure in 1945 of Germany's latest model submarines and the capture of German technical personnel skilled in the design manufacture, and operation of such craft. How far she has capitalized on those assets is unknown. However, high pressure has been applied by Moscow in recent years to raise the standards of training, education, and morale.

Russia's European satellites are a potential possibly a real, asset to her military power. Postwar reorganization of the several military establishments began with the wholesale elimination of personnel whose love for Russian dictatorship was in doubt. The build-up and training of new forces around a core of politically reliable men has continued to the present. Results have been mixed, judged by the continuing defection and escape of military personnel. Performance standards appear to be well below those of native Russian forces.

United Kingdom.—The British training system, like that of the United States, is closely geared to the separate and combined needs of the nation's varied composite of armed forces. The nucleus of the British Army, Royal Navy, and Royal Air Force is found in their career officer and professional, long-service, volunteer enlistee personnel. It is rounded out by the Territorial Army and reserves of the major components. A large fraction of the enlisted force of the army's active service units consists of conscripts inducted under the National Service Act of 1947 calling for two years of active service by youth who have reached the age of 18, and eight years in one of the reserves. Such reserve duty may be taken in the Territorial Army, comparable to the United States National Guard, which become available for overseas duty only when required by major emergency, as determined by Parliament. Voluntary premilitary training is made available to youths in the 14-18 year bracket. It provides an excellent source of potential noncommissioned and commissioned officer material. Since 1940 all premilitary and basic military ed

ucation has devoted considerable time and effort to indoctrination in the obligations of citizenship. Women's services, maintained on a voluntary basis, were integrated into the three major components in 1949.

Army basic training for enlisted personnel is carried out by the separate branches of service and is continued in the unit to which the recruit is assigned. Recruits who demonstrate aptitude for leadership or technical abilities are early selected for special training. Unit training is made progressive during the spring and summer, leading up to combined maneuvers in the fall. Usually these are climaxed with exercises involving army, air force, and navy units.

Officer material is secured from a wide range of sources. Qualified candidates for a regular commission are sent to the Royal Military Academy, at Sandhurst. Graduates of the University Training Corps, similar to the ROTC in the United States, receive commissions in the Territorial Army, while several all-arms officer cadet schools provide officers for National Service commissions. Separate arms and services schools are responsible for the training of enlisted specialists and junior officers. General schools serve the needs of all arms and services in areas of endeavor ranging from command and staff duty to pure science and technology. Admission to the latter is by selection. The selective process is used also in making up the quotas for the highest level interservice schools, ending with the Imperial Defense College.

The Royal Navy, bearer of the oldest British professional service tradition, gears its program of training and education to that tradition. Also, every Britisher realizes the navy's life-and-death role of keeping open the sea lanes connecting an overcrowded island with all parts of the world. These factors make for standards of performance not surpassed by any other naval force. The standards are greatly furthered by the popularity of the navy, indicated in its ability to recruit nearly all its personnel on a voluntary basis for initial enlistments up to 12 years in length. Only a small quota of 24-month National Service conscripts is needed to keep personnel strength at peacetime levels.

Three routes to a commission are provided. Candidates for a line commission are admitted directly from civil life by examination to the Royal Naval College, Dartmouth, at the age of 16, or by special entry after a few years of service at the enlisted level. Courses for both groups include a period of fleet service after completion of the Dartmouth requirements. Candidates for commissions in various administrative and technical lines are secured at a higher age from among young men educated in the desired fields at civilian institutions. Advancement in rank, automatic at the outset, early becomes selective as officers qualify for admission to a progression of graduate schools, successfully complete their courses and prove their merits in fleet service. The most important postgraduate school is the Royal Naval College, Greenwich. Its courses embrace most of the range of technical, staff, and general educational fields open to the line officer or specialist. Limited numbers of officers are sent to interservice schools and finally to the Imperial Defence College.

Premilitary training for enlisted personnel may begin ashore in a boy's 16th year. Basic training, likewise ashore, begins at 18. Both in-

clude considerable general education. The young seaman completes the practical and technical parts of his training on shipboard, along with instruction in educational matters of importance to a seaman. Promising men are screened out for advanced training to become specialists and petty officers. The very best are permitted to qualify for commissions. The annual training program is completed with fleet maneuvers.

Supporting the regular establishment is the Naval Reserve and various types of auxiliaries. In effect, as recent wars have shown, all officers and sailors of the merchant marine and the fishing fleet constitute a general naval reserve. Ample opportunities are provided for part-time training of such personnel.

The Royal Air Force, youngest component of the national defense system, is extremely selective in the procurement of its air crews, both commissioned and enlisted. The great bulk of the National Service men taken in are assigned to ground crew duties; in fact the short period of required service makes such action mandatory. Premilitary instruction for apprentices in technical trades is provided for boys. At the age of 18 they may be accepted for a 12-year enlistment. At a corresponding age, youths who wish to fly may join a training squadron. The best of both groups are given the opportunity to qualify for commissions.

The major nucleus of general-duty air officers is produced by the RAF College, Cranwell. After a period of commissioned service, junior air officers receive training in various specialties. Some years later they may be selected for advanced training in high command and general staff duties, and still later for courses at interservice schools. Operational training includes participation in annual exercises for all components of the armed forces.

The basic principles underlying the training system of the Royal Air Force are not dissimilar from those of the army. The major distinction occurs in the vastly greater emphasis on technical training, not only to develop personnel concerned with flying duty, maintenance of aircraft, research, and so forth, but also to provide the specialists who operate the aircraft warning system and the anti-aircraft artillery installations. The enormous expansion of the RAF during World War II entailed a number of short cuts in the procurement of commissioned personnel and enlisted specialists. In recent years standards for acceptance have been raised, particularly in the procurement of officers. In general, the officer candidate must now serve a period as an enlisted man before he becomes eligible for a commission. Cadetships are open to airmen who can meet the age and educational requirements, to youths from civil life, and to RAF apprentices who complete their term of service. General Duties cadets, the men earmarked for flying duty, are trained at Cranwell, where they receive both flying and ground instruction. Other institutions train cadets whose careers will be in the ground branches responsible for maintenance and administration.

Career officers after 10 to 15 years of service are sent to the RAF Staff College, in preparation for high command and staff duty. Selected officers are later ordered to the Joint Services Staff College and a limited number to the Imperial Defence College.

The United States.—The National Defense Act of 1916, amended in 1920, along with com-

plementary laws for the navy provided for a small peacetime professional nucleus. In theory it called for rapid expansion to meet a military emergency, initially through the absorption of reserve elements into active full-time service, thereafter through the mobilization of the untrained reserve of able-bodied male citizens at the call of Congress. The rate and cost of actual mobilization after Pearl Harbor disclosed the unsoundness of the policy in fact if not in theory. Only one aspect of this failure, namely peacetime training and education, is of interest in this connection. Insofar as appropriations permitted, the schooling of officers and of potential officer material during the years between the two world wars was the brightest spot in the picture. The establishment of several new basic and advanced schools for the various arms and branches (like the Infantry School, Fort Benning, Ga., and the Signal School, Fort Monmouth, N. J.) assured the steady development of competent troop leaders. At the next level, an expanded Command and General Staff School, Fort Leavenworth, Kansas, turned out increasing numbers of officers trained for higher command and staff duties. Top-level schools like the Army War College and its navy counterpart used the lessons of World War I in their studies of grand strategy and their draft of war plans. A newcomer was the Army Industrial College, charged with research and training in all matters affecting wartime economy.

The largest single instance of expansion occurred on the campuses of more than a hundred colleges and universities, where the Reserve Officers Training Corps was expanded to prepare civilian students for the duties of junior officers. The availability of that backlog was of inestimable value in transforming the early millions of draftees into combat-worthy soldiers. In addition, a greatly improved National Guard program, including the assignment of selected officers to all levels of courses maintained for the Regulars, helped to ready that second line of defense for active service. Lastly, provision was made for the training of enlisted specialists, both in military establishments and in selected industrial plants.

In sum, such steps marked a great advance over pre-1917 conditions. The benefits, however, were sharply limited by the fact that the shortage of both funds and troops made it impossible to put classroom theory to the test of field maneuvers. That condition was corrected in the army only when the modest expansion of forces in 1940 made it possible to assemble skeletonized divisions and combat teams. The most serious deficiency, one in which United States ground forces lagged far behind the German military machine, was the lack of modern weapons and equipment. Without the weapons, there could be no realistic training. The navy, although with a greatly reduced complement of ships and men, had continued its policy of fleet maneuvers, including the testing of prototypes of modern ships.

Emergency legislation, beginning in 1940 with the Selective Service Act, was aimed at providing the men and equipment to put the armed forces on a fully modern basis. By the end of 1941 a respectable complex of training establishments was functioning in the United States and overseas territories despite the fact that much of the training was done with World War I types of

weapons and improvised matériel. The global nature of the war was reflected in the opening of training centers designed to develop units for combat under the widely diverse requirements of jungle, desert, polar, airborne, and mountain fighting. Heavy emphasis was given to the joint army-navy techniques of amphibious warfare, in preparation for the storming of enemy-held beaches. Ground forces and army-air force tactical elements, taking a lesson from Germany's military successes, cooperated to provide team play in the coming battles; and the first steps in the direction of triphibious warfare were undertaken. Field maneuvers at this early stage showed more shortcomings than successes, clear evidence that the training of United States forces lagged far behind that of its major enemies. In one important aspect, that lag could not be overcome. German and Japanese troops (as also the Russians) were trained to push advancing infantry and armored elements forward into, rather than up to, supporting artillery fire. Combat statistics clearly show that the resulting losses from friendly artillery fire run far lower than those suffered when the defenders, recovering after the fire has passed beyond them, man their weapons and cut down the attackers. Despite this fact, American public opinion has never tolerated adoption of such realistic assault techniques.

Mid-1943 found all training establishments filled beyond capacity. These included not only the military camps and stations, but also some hundreds of colleges where accelerated courses were being given to selected students in uniform, and a wide range of industrial plants conducting courses for maintenance personnel. Officer candidate schools were for a brief period turning out a surplus of lieutenants. In the process, the original educational requirements for an officer candidate had been repeatedly reduced to a point where in time it was to become—and still remains—a serious problem. Training abroad, notably in the growing establishment in Great Britain, had assumed large-scale proportions. The shortage of modern weapons in these camps gradually disappeared. One year later many of these activities had been sharply curtailed, partly because the pipeline of trained personnel had in many respects been filled, partly because the demand for ground forces—chiefly of the infantry—had fallen behind planned combat requirements. Wholesale retraining of antiaircraft troops, originally tailored for home defense needs, and of Army Air Force ground elements, to convert them into infantry, was the order of the day. More than 100,000 Army Specialized Training Program trainees were transferred to infantry divisions in the spring of 1944.

In the final test of the campaigns which first halted Axis aggression and then drove forward to victory on all fronts, the composite of training for all components proved its merit. One shortcoming showed itself after the fighting had ceased; the preparation of all ranks for the highly specialized duties of military government was seriously inadequate. While postwar demobilization was eliminating most of the major units and cutting the occupation troops into fragments, the job of policing occupied enemy territory had to be learned on the spot. The record of that experience makes unpleasant reading. For a while, combat training almost vanished from the picture, largely because the slender garrisons of

occupation troops were too much dispersed and too fully occupied with the business of military government. However, certain major lessons of the war were promptly reflected in the reorganization of the entire complex of the armed forces' system of officers' schools. The Army War College reopened as the National War College, the highest level institution for the training of selected officers of all arms and services, and likewise of State Department officials. A similar transformation converted the Army Industrial College into the Industrial College of the Armed Forces. The opening of the Armed Forces' Staff College under the navy's direction provided for advanced training in the staff and operational aspects of amphibious and triphibious warfare. Moreover, all high and medium level schools operated by each of the three major services arranged to accept quotas of student officers from the other two. Lastly, the wartime practice of including quotas of officers from allied countries was continued on an expanded basis. The value of such moves toward unification in the training of United States officer personnel and toward some integration with allied nations proved itself after 1950, when Communist aggression compelled the rebuilding of the Western World's defensive strength.

The reorganization of training at the troop level came more slowly. Large-scale field exercises as well as major naval and air maneuvers were impossible after the trained manpower available in the United States became inadequate for such exercises. This situation was reversed only when militant communism's aggressive intentions were made clear by a succession of major actions in both Europe and Asia. For four years Congress' reaction, expressed in sporadic increases in armed force strength and subsequent decreases as Communist pressure declined, had been reflected in corresponding ups and downs of military training. The chain of events beginning with the Communist effort to seize South Korea placed the United States on a basis of partial mobilization. By 1953 trained forces and equipment were on hand to restore some military stability on all major fronts. The same year brought the first real results of the efforts to give tactical application to atomic power. Three years earlier the air force and the navy had expanded their training programs for the strategic use of atomic missiles. The disclosure of Russia's possession of the secret of atomic power compelled the three armed services to organize joint defensive measures for protection of the North American continent and key installations overseas. Close defense of strategic areas in the interior required the army and National Guard to organize and train anti-aircraft units, working in cooperation with air force interceptors. Radar teams were trained to man wide-flung networks in the United States and Canada, and in advanced areas occupied by American troops abroad. All such training, along with officer education, was complemented by a program aimed at delivering, when necessary, full-scale retaliatory attacks against selected Communist installations. In early 1954 all such measures had advanced far enough to warrant the administration's announcement of a new policy, combining a reduction in United States armed force strength with greater dependence in the future on the most modern weapons and techniques, notably the strategic A- and H-bombs and the expanding "family"

of modern tactical weapons and missiles used by the army and navy. See NAVAL EDUCATION.

NATO.—The most complex peacetime training system on record is the effort to blend the NATO military forces into a strong, flexible, and fully integrated force for the defense of Western Europe. It is best viewed from the top down. The NATO Defense College, opened in Paris in late 1951, trains quotas of selected staff officers and civilians in the fields of NATO strategy and its military implementation. At the NATO headquarters, on-the-job training continues this program. Language and area instruction are emphasized. The effort to provide troops with standardized weapons and equipment requires the extensive use of training crews for familiarization purposes. Field tests of the efficacy of these methods are frequent. Maneuvers in some instances have involved operations embracing bases in the North American continent, and the sea, air, and land lines of communications to NATO's advanced positions. Smaller exercises for single components and for units of the ground forces down to combat team level, as also for their air and naval counterparts, are regular features of the annual training program. At the end of 1954 there remained the problem of the joint effort to institute a system of training to ensure the earliest possible development of Western Germany's prospective increment to the NATO forces. The task was expected to fall chiefly on a United States training mission inasmuch as most of the arms and equipment were of American origin.

International Cooperation in Military Education.—Leading military institutions the world over have always been a Mecca for career officers bent on getting to the top of their profession. Military allies for at least two centuries past have practiced some system of exchange of student officers. More recently officer candidates have been entered as cadets in foreign countries. As of June, 1952, for example, the roster of the United States Military Academy included 17 foreign cadets, most of them from Latin America. Foreign officers in much greater numbers were at the same time enrolled in the graduate schools of our three armed services. In turn, United States officers are sent abroad for military study.

Military Missions.—One more device looking to cooperative military effort is seen in the assignment of military missions to friendly nations with a view to improving their defense establishments. The United States military mission in Greece was a vital factor in re-creating the national forces which in 1949 eliminated the Communist army from that country. The United States mission in Turkey has since 1947 supervised to excellent effect the education and training of the Turkish armed forces. Other missions in Iran and Formosa are working to the same end. The great majority of United States military missions, however, like those assigned to Latin American countries, are operating under conditions of less urgency than those just cited. The program does much to promote sound liaison and understanding, and—more specifically—to inculcate a common application of tactics and techniques. Above all it should facilitate common action against a common foe in an hour of crisis.

HERMAN BEUKEMA.

MILITARY ENGINEERING. Military engineering is that branch of engineering science

applied under the direction of military commanders to maintain and increase the combat effectiveness of military forces. Specifically, military engineering is used to facilitate the movement and supply of friendly forces, to impede hostile movement and supply, and to provide for the shelter and comfort of friendly troops. The work may be carried out by engineer troops, or accomplished under the supervision of engineer officers by details of troops from other arms, by civilian labor, or by a combination of these means. Engineer troops are organized, trained, and equipped for carrying out such work, and also, in the usual case, for combat as infantry.

Military engineering work may be divided into those activities prosecuted in the theater of operations, which is the territory occupied and organized by the field forces for the carrying on of hostilities, and into those activities carried on in the zone of the interior, which is that part of the home country which remains under civil administration.

Military Engineering in the Theater of Operations.—Engineering work designed to facilitate the movement and supply of friendly troops consists in the main of the following: (1) engineer reconnaissance of roads, railroads, bridges, facilities, defensive positions, campsites, and engineer materials available locally; (2) the procurement or making and distribution of maps and map substitutes for the use of the military forces; (3) the removal of obstacles to movement; (4) the provision of boats and footbridges to assist infantry across streams; (5) the bridging of streams to insure the mobility of the artillery and supply columns; (6) the repair of roads by filling shell and bomb craters, replacing demolished culverts, renewing the surface where damaged, and signposting the roads; (7) the repair, extension and operation of railroads, and the construction of wharves, supply depots, and similar establishments to facilitate supply (see MILITARY RAILWAYS); (8) the construction of landing fields and other facilities for the air corps; (9) the provision of a supply of water in areas which otherwise troops could not pass through or occupy; and (10) the execution of demolitions and creation of obstacles for the protection of flanks and lines of communication against motorized or mechanized raiding parties.

Engineering work designed to impede the movement and supply of the enemy consists in the main of the following: (1) the creation of barriers to enemy movement, including the execution of demolitions, and provision of obstacles; (2) the furnishing of technical assistance to other combat arms in the organization, fortification and camouflaging of defensive positions, and the furnishing of the necessary tools and engineering supplies; and (3) the construction of special works, such as command and observation posts for higher echelons and dug-outs or bombproofs.

Engineering work designed to provide for the shelter and comfort of friendly troops consists of the construction of temporary cantonments, rest camps, and all engineer appurtenances thereto, and such other engineering works as are found practicable and desirable. In addition, engineer troops operate all utilities of general service to the military forces, except signal communications and such utilities as may be

assigned specifically to other services, such as the quartermaster corps.

Certain elements of military engineering mentioned above are discussed in detail in later paragraphs.

Military Engineering in the Zone of the Interior.—The following military engineering is carried on in the zone of the interior, both in peace and in war: (1) the preparation of technical literature; (2) the provision of permanent defensive works, including participation in the selection of sites, preparation of plans and estimates, and construction and repair of fortifications, including the procurement, installation, and maintenance of such accessories therefor as searchlights, electric power and lighting systems, and fire control systems; (3) the preparation, reproduction, and distribution of military maps, including co-operation with other government and private mapping agencies, and reconnoitering and surveying for military purposes; (4) the development, procurement, storage, and distribution of engineer equipment and supplies and certain other equipment; and (5) the development of bombproofing and camouflage technique for the protection of important installations such as air fields and vital manufacturing plants.

Military Roads.—The tactical plans of the commander, the supply arrangements made necessary thereby, and the condition of the roads in the area determine the type and amount of military road work which must be done. This is held to a minimum but must be adequate. Generally, combat troops with modern transportation are able to move over any roads if obstructions are removed, but the roads require maintenance because of heavy traffic caused by supply, evacuation, and replacement requirements. This traffic moves between supply and evacuation facilities, generally at the heads of railways leading to the front, and the combat troops. In determining the number and location of roads to be maintained, attention must be given to the locations and requirements of combat elements and to the capacity of the roads in vehicles over a period of time. Though the theoretical capacity in vehicles per hour of a one-way, one-lane road is about 2,000, the actual working maximum for military traffic is only about 750. Considering traffic friction and time lost due to turnouts and turns, the working capacity for a two-lane road with traffic moving in both directions is about an average of 250 vehicles per hour in each direction, though a higher rate may be obtained for short periods by special effort. These capacities will be cut down if, due to enemy air power, supply must take place only at night or with vehicles moving at increased intervals. In addition to maintenance of supply roads, some construction will have to be done at supply facilities.

Special definitions used in connection with military roads are as follows: *axial road*—a road leading toward the front and generally perpendicular thereto; *main supply road*—an axial road designated as the principal traffic artery of a division or higher unit; *belt road*—a road parallel to the front, also known as a lateral road; *reserved road*—a road, the use of which is reserved for some particular unit by higher authority; *strategic road*—a main arterial highway which lends itself to the whole-

sale movement of troops and supplies over a considerable distance in furtherance of a general strategic plan, and which is usually constructed as part of the highway system of the country; and *tactical road*—a road over which troops or supplies may be moved for the execution of a specific, limited operation.

Military roads are classified as standard roadways, and improvised or hasty roads. Standard roadways may be of high-type, hard surfaces, such as brick, concrete, or macadam; or low-type surfaces such as gravel, shell, coral, sand clay, or earth. Improvised roads include plank roads, corduroy, wire-mesh or expanded-metal roads, tread roads, and trails.

Minimum design requirements for strategic roads in the United States are: (1) high-type surfacing at least 20 feet wide to support 9,000-pound pneumatic wheel load; (2) in flat or rolling country, grade and curvature not to exceed 5 per cent in lengths greater than 500 feet and 6 degrees respectively; in mountainous regions, limitations are 8 per cent in lengths greater than 500 feet and 14 degrees respectively; (3) vertical clearance, 14 feet; (4) capacity of bridges—to carry 15-ton vehicles; and (5) minimum sight distances—nonmountainous, 1,000 feet, mountainous, 650 feet. The basic require-

necessity for obtaining control of ground on the opposite bank of a stream before vehicular bridges can be built requires some means of moving infantry over such an obstacle if it is unfordable for foot troops. These means usually consist of standard equipment, provided organically in the service for such use. Such equipment consists generally of pneumatic rafts, assault boats, standard footbridges, standard cartbridges, or ponton boats used for ferrying. In addition, improvised rafts and footbridges may be used. Floating improvised types use gasoline drums, cans, wooden floats, or other expedients for buoyancy; nonfloating expedients may be simple stringer, light trestle, or pile-bent bridges.

As to the types of standard equipment provided, pneumatic rafts are not used in the United States Army, though foreign armies make use of them. The United States assault boat, used for passing assault waves of infantry over streams, is of a conventional skiff type about 13 feet 6 inches long, with a flat bottom, a square, slightly sloping stern, and a pointed bow. It weighs about 200 pounds. The skin of the boat is of $\frac{1}{4}$ -inch fur plywood, highly resistant to moisture. With a minimum of 6 inches freeboard, the boat displaces 3,200

EXAMPLES OF MILITARY ROADS

ment for a tactical road is that it carry the traffic satisfactorily. However, a minimum width of 9 feet for one-lane traffic or 18 feet for two-lane traffic is desirable; grade should not exceed 10 per cent; radius of curvature should be in excess of 150 feet, or additional width of 10 feet should be provided; and overhead clearance of at least 11 feet is required.

The fundamental requirement in construction and maintenance is to provide and keep up an adequate drainage system, an adequate foundation, and a suitable road surface. Measures used to provide drainage are, as in civil practice, adequate crown, side ditches, culverts, and if necessary, subdrains. Maintenance generally consists of keeping these facilities working. In providing a suitable surface, crushed rock or gravel, with or without bituminous treatment, will be used as a rule. In general, maintenance will consist of repairing with materials available any damage to the surface.

Ordinarily, roads are constructed, repaired, and maintained by general engineer troops assigned or attached to the various command echelons such as the division. Only emergency work to let troops pass is done by the forward engineers, who are backed up by units further to the rear, doing heavier work.

Boats and Footbridges for Infantry.—The

pounds, and will carry 11 men or an equivalent load. Boats are carried by truck, 10 boats being a standard load for a $1\frac{1}{2}$ -ton engineer dump truck, and are launched by hand. They are propelled by paddling or by a $4\frac{1}{2}$ horsepower outboard motor. Usually engineer crews of two men are provided. The United States foot or cartbridge equipment consists of duckboards and floats with other appurtenances. The floats are white pine crates, containing expanded rubber blocks. The duckboards and floats may be assembled to provide a passage 22 inches wide for foot troops, or a passage 5 feet 6 inches wide for carts. The cartbridge uses three times as much equipment per length of bridge. A unit of footbridge equipment (432 feet of bridge) is carried in four $1\frac{1}{2}$ -ton dump trucks. The bridge is assembled in bays or sections on the shore, and the bays are carried to the water, floated, and fastened together. Trained engineer troops have built 350 feet of this bridge in a three-mile current in daylight in eight and one-half minutes. Ponton boats, which may be used for ferrying infantry, are mentioned in the following paragraph.

Vehicular Bridges and Stream-Crossing Expedients.—Lines of communication such as roads and railways must be kept intact to be of value. Their particularly vulnerable

points are bridges. In addition, bridges or other means of crossing streams are needed by the vehicles accompanying the combat troops, such as the artillery. The provision and maintenance of bridges and other means of crossing streams is therefore an important engineering duty.

Special definitions used in connection with military bridges are as follows: *balk*—standardized stringers of a floating bridge; *bent*—an intermediate, transverse support of a trestle or pile bridge, consisting of a framework of horizontal and vertical members; *chess*—standardized floor planks of a floating bridge; *ponton*—a float, often in the form of a standardized boat, used to provide buoyancy for the superstructure of, and the imposed loads on, a floating bridge.

Military bridges are classified as floating and nonfloating. The commonest types of floating bridges are those built of the standardized ponton equipment with which every army is provided. Such bridges may be constructed

age, which can be transported on trucks and used to build light or heavy vehicular bridges over spans up to about 125 feet. Equipment used by the United States Army is classified as light and heavy and is suitable for loads up to about 40 tons.

In the design of military bridges, factors of safety are reduced considerably below those used in civil practice. In the latter, the factors are usually 4 to 6 for wood and 2.2 for steel. Military practice uses 3 for wood and 1.75 for steel. In addition, allowances for impact and the like are somewhat reduced, the idea being to save materials, transportation, labor, and time, since ordinarily the bridge to be built is not permanent. Design standards contemplate provision of a 10-foot roadway for single-lane traffic, and 18-foot roadway for two-lane traffic, and at least 11-foot overhead clearance.

In building trestle or pile-bent bridges, it is desirable to follow a standard design whenever possible, since, thereby, materials to be stocked in engineer depots may be standardized, and

Trestle Bridge

TYPES OF MILITARY VEHICULAR BRIDGES

in a minimum of time and over any waterway which provides the necessary depth of water to float the boats. Ordinarily, light and heavy ponton equipment with which to install light and heavy vehicular bridges is provided. The light equipment used by the United States Army will carry 10 tons, and may be reinforced to carry 20 tons by using additional pontoons and balk. The heavy equipment will carry 25 tons, and may be reinforced to carry about 45 tons. One unit of equipment for these bridges will provide about 250 feet of standard bridge and about 125 feet of reinforced bridge. Generally, the equipment is maintained and transported on trailers by engineer troops especially provided for these purposes. In the absence of the standardized equipment, ponton bridges may be built with improvised supports consisting of metal drums, wooden rafts, or boats.

The commonest types of the nonfloating military bridges are single-span stringer bridges, trestle and pile-bent bridges, lashed-timber bridges, and bridges constructed of standardized portable girder equipment of high-strength steel. Most armies are now provided with such equip-

ment trained to erect such bridges quickly. In the United States Army standard design for a trestle bridge to carry loads of 15 tons has the following characteristics: bents—framed from 6- by 8-inch timbers, the thickness of the bent being 6 inches, the posts 4 in number with a height not to exceed 16 feet, the bent braced with 2- by 10-foot lateral bracing; stringers—either wooden or CB steel beams, the wooden stringers consisting of eight 6- by 12-inch timbers not exceeding 16 feet in length, or the steel beams, six in number, not exceeding 25 feet in length and of a suitable size; and flooring consisting of two thicknesses of 3- by 12-inch timbers, the lower layer across the stringers, and the top layer forming two treads 4 feet in width along the bridge. The trestle bents must be braced along the bridge with longitudinal members of 2- by 10-inch timbers. This bridge may be modified to carry only 10-ton loads by omitting a suitable number of stringers and the top layer of flooring. It cannot be easily strengthened to carry over 15 tons.

In addition to building bridges, military engineers are trained in rapid estimation of the

load capacity of existing bridges, and the quick reinforcing of bridges unsafe for expected loads.

Means other than bridges of crossing vehicles over streams are fords, passage on ice, and passage by boats, rafts, and ferries. Assuming moderate currents and hard bottoms, streams, in general, are fordable when depths do not exceed the following: for infantry, $3\frac{1}{2}$ feet; for cavalry, $4\frac{1}{2}$ feet; for artillery (horse drawn) and for wagons, 3 feet; for trucks, 2 feet; for light tanks, 1-3 feet; for medium tanks, 2-4 feet; for heavy tanks, 4-6 feet. Fords as a rule are located and prepared or improved by engineer troops. Crossing by ice is an expedient which rarely will be used, but may be found valuable in northern sections of the country. New, sound ice in floating contact with the water will bear the following loads: 3 inches, small groups of men; 4-5 inches, cavalry in small groups; 7 inches, wagons and 75-millimeter guns; 9-12 inches, 10-ton loads; and over 20 inches, 20-ton loads. In freezing temperature, the thickness may be increased by flooding the surface. The laying of wooden treads or 6 inches of straw on the passage will considerably increase the bearing power. However, this figure varies considerably under different circum-

stances, and all precautions should be taken both in establishing the crossing and using it. Passage by boats, rafts, and ferries has the objection that it is a tedious and slow process for large bodies of troops and transport. However, it will be used frequently. The type of crossing provided will depend on the equipment or materials available. The best crossing of this type is constructed with standard ponton equipment, using three pontoons, balk, and chess to form the raft, and propelling the raft with a ponton and outboard motor. In the absence of such equipment, ferries may be propelled by hand, by motors on the shore, or by utilizing the force of the current by turning sidewise the boats supporting the raft.

stances, and all precautions should be taken both in establishing the crossing and using it. Passage by boats, rafts, and ferries has the objection that it is a tedious and slow process for large bodies of troops and transport. However, it will be used frequently. The type of crossing provided will depend on the equipment or materials available. The best crossing of this type is constructed with standard ponton equipment, using three pontoons, balk, and chess to form the raft, and propelling the raft with a ponton and outboard motor. In the absence of such equipment, ferries may be propelled by hand, by motors on the shore, or by utilizing the force of the current by turning sidewise the boats supporting the raft.

Organization of the Ground for Defense.—

When a military force is on the defensive on part or all of its front, the terrain at these locations is prepared for defense by the deployment on the ground of the troops, arrangement of the available fire power, and the employment of field fortifications to strengthen the position.

In locating and constructing a system of field fortifications, an appreciation of the terrain is of vital importance, since field fortification consists primarily of strengthening its defensive value. Terrain is evaluated in terms of six factors: observation, fields of fire, cover, obstacles, routes of communication, and

general conformation of the ground. Observation over enemy approaches and over the battle position itself enables the fire power of a unit, including particularly that of the artillery, to act effectively. Therefore, defensive positions are located to utilize and protect important observation. Adequate fields of fire allow the full fire power of the unit to be brought to bear. Cover allows concealment from hostile observation, both from the air and ground, limits action of enemy artillery and aircraft, and confronts the attacker with tactical surprise. Obstacles hinder movement of the enemy and hold him under the defenders' fire. Routes of communication affect the possible supply arrangements of both the attacker and defender. Conformation of the ground, such as ridges perpendicular to the enemy's approach or valleys leading into the defensive position, affect both the possible organization of defensive fires, and the ability of the attacker to bring his fire power into play.

In organizing a position, tactical organizations such as regiments, battalions and companies occupy and fortify localities along the position for all-around defense. Such positions have both width and depth. For example, a regimental position may have a width, or sector, of from 1,600 to 4,800 yards, and a depth of from 900 to more than 1,800 yards. Positions of smaller units have correspondingly smaller dimensions. In addition, some units are held in reserve. Within a regimental sector, the tactical localities are usually arranged for combat, mutually supporting fire, and counter-attack missions into four lines, from front to rear: the main line of resistance, the support line, the battalion reserve line, and the regimental reserve line. Of these lines, the first and the last mentioned are usually the most important to hold intact. In addition, there may be created outpost positions to the front and complete or partial battle positions in rear.

The positions as thus selected are strengthened by field fortifications. In hasty fortification work, the following would be carried out: camouflage of important installations, clearing fields of fire for machine guns, digging emplacements for machine guns and other important weapons, erecting wire entanglements, digging small pits for individuals, and digging shallow trenches connecting the pits. If time permits, additional work may convert the position into what is known as a deliberate fortification, in which there would be provided: standard fire and communication trenches, dummy trenches, additional wire entanglements and other obstacles to movement of personnel, antitank obstacles, artillery emplacements, splinter-proof

or shell-proof command and observation posts, and finally, protected shelters for all troops. The rule followed in such work is to carry on the most vital items first.

Ordinarily, the occupying troops organize the ground and construct the fortifications. Duties of engineers are to provide tools and materials and to execute works of general use, such as command and observation posts for higher units, communications for supply and evacuation, and all works of such a technical engineering nature that they are beyond the capabilities of the occupying troops. However, in the construction of rear battle positions or permanent fortifications, engineers would carry on the work. See **FORTIFICATIONS; TRENCHES.**

Barriers, Obstacles, and Demolitions.—Modern armies use large numbers of motor vehicles for reconnaissance, combat, transportation of troops and supplies, and for hauling artillery and equipment. These include motorcycles, scout cars, armored cars, tanks, trucks, and tractors. The use of this equipment greatly increases the mobility of the military force and its striking power, either in attack or coun-

struction such as mine fields, gassed areas, tank ditches, fields of steel rail, wooden posts, heavy fences, cribs, cables, wire rolls, or barricades. Works of construction must be designed to deal effectively with the capabilities and limitations of the enemy vehicles which they are intended to stop.

Works of destruction are accomplished by demolition with explosives, by burning, wrecking, air bombing, artillery fire, or flooding. For the engineer, demolition by explosives is the most important of these means. Such a demolition should be thorough enough so that the enemy will be forced to replace the structure rather than repair it. To cut steel or wooden members of bridges, a quick-acting explosive is necessary, such as dynamite or trinitrotoluene (TNT), the standard United States military explosive. The destruction of a hostile tunnel is accomplished by firing a camouflet, a charge which exerts all its effect below the surface of the ground. Extensive damage to surface works, such as roadways, may be carried out by firing a mine placed underneath the works. Charges for camouflets and mines must be

Cross Section at Center of Concrete Bridge

NOTE: The 5 top charges tamped with mud, other charges held with sand bags or blocked in.

Concrete Bridge

Steel Truss Bridge

PLACING OF DEMOLITION CHARGES

terattack. The means of minimizing the power thus created, for a force on the defensive in whole or in part, must consist of fire to destroy or damage the vehicles, or the blocking of paths by which the vehicles may advance. Military engineering is chiefly concerned with the latter: the creation of barriers to movement, consisting of obstacles.

Special definitions used in connection with barriers, obstacles, and demolitions are as follows: *mechanized unit*—a unit, the main portion of which is equipped with armored combat vehicles; *antimechanized defense*—a collective term including all measures for defense against mechanized units; *obstacle*—anything other than fire power used to impede or stop enemy vehicles; *barrier*—a group of obstacles used to block passage by motor vehicles through a region; *barrier tactics*—the use of obstacles defended by fire to further the plans of a commander; *road block*—an obstacle or group of obstacles used to block a road and the adjacent open terrain; *demolition*—the destruction of an object, such as a bridge, to deny its use to the enemy.

Obstacles may be natural or artificial. Natural obstacles include such terrain features as water courses, ponds, swamps, gullies, steep slopes, heavy woods, and the like. Full advantage must be taken of such features in creating a barrier. They are supplemented when necessary by artificial obstacles. These may be works of destruction such as destroyed bridges or buildings, road craters, inundations, and felled trees or telephone poles; or works of

carefully gauged to obtain the desired radius of destruction and no more. If undercharged, the destructive purpose of the explosion is not accomplished; if overcharged, explosive will be wasted. Charges for cutting and breaching materials and for the charging of mines and camouflets are figured by empirical formulae used in the military services and founded on experiment and experience. Demolition men quickly become expert in the use of these formulae, and can predict the action of explosive quite accurately. The action of any charge is vastly increased by confining the action of the explosive in some manner, such as by sandbagging it or tamping thoroughly a shaft leading to a mine.

Organization and Equipment of Engineer Troops.—Engineer troops in the United States Army are organized, trained, and equipped to carry on the above duties, and are assigned as component parts of the larger units of the army, the smallest unit to which they are assigned being generally the division. Higher echelons, such as an army corps or a field army, have additional engineer units, the principle being to assign the minimum number of engineers to the lower echelons for carrying on ordinary missions. Generally, a division will have as a component part an engineer combat battalion; a corps, in addition, would have two engineer combat regiments, and a topographical company; and a field army, in addition, would have three general service regiments, six separate battalions, a topographical battalion, a camouflaging battalion, a water-supply battalion, four light ponton companies, two heavy ponton bat-

tations, and shop, dump-truck, and depot companies. Additional engineer units would be held in general headquarters reserve. Though the organization of different types of engineer units necessarily varies, the types which do general work, such as the combat battalion and the combat regiment, are composed of units similarly organized. The basic work unit is the platoon which has headquarters, an operating section of three squads of 12 men, and a tool section having pioneer, carpenter, and demolition equipment and supplies. Three platoons are combined into a company with company headquarters for command and administration. Three companies combine into a battalion with battalion headquarters. Additional equipment and supplies are usually carried by the company and higher headquarters. The equipment provided in engineer units consists of both hand and power tools. For instance, in the combat battalion for work on roads, there is an ample supply of picks, shovels, axes, log chains, machetes, saws, brooms, stone forks, rakes, road tampers, and wheelbarrows; also such equipment as drag scrapers, air compressors with air tools, gasoline-operated pavement breakers, tractor bulldozers, dump trucks, and a motorized earth auger. For work on demolitions, standard demolition sets are carried by each platoon, and in addition, such items as hammers, axes, saws, wrecking bars, and explosives. Generally, the equipment of a general engineer unit is such that the whole unit can be employed simultaneously, either on carpentry, pioneer, or demolition duty, or on other usual types of work. MILITARY INTELLIGENCE. Evaluated and interpreted information upon which the armed forces base plans and preparations for war and conduct operations if war eventuates, is known as military intelligence. The complete processes by which military intelligence is produced and made available for use includes collection, collation, evaluation or analysis, interpretation, and dissemination. Dissemination must be accomplished in time for military intelligence to influence estimates, decisions, plans, and operations, or the very purpose of the intelligence organization is defeated.

Historically the term military intelligence is relatively new. This does not imply, however, that the function is new. It is as old as the first organization of men into a political body. After men had grouped themselves into a political body, collection of information essential to security ceased to be entirely an individual responsibility

and became somewhat centralized in the chief of the clan or head of the nation.

The gathering and use of military intelligence was simple in ancient times as it always is among primitive peoples. With the passage of time nations became larger, civilization more complex, and the people more readily controlled and manipulated by their rulers. Industrialization and mechanization, communications, and the range, speed, and destructiveness of weapons accentuated the importance of military intelligence in all of its aspects. At the same time, the instruments and means for accomplishing the intelligence mission have been multiplied. New instruments, many of them highly technical and mechanical, have been superimposed on older means of gathering information, but many of these older ones, such as agents and political and military observers, still play a vital role. The intelligence organization of a great nation in the atomic age has, therefore, become an exceedingly complicated thing.

With the development of the means of communicating ideas and of influencing mankind in an ever widening area, the military intelligence agencies of the great nations progressively became more and more concerned with influencing the actions of friends and of enemies and with maintaining, by counterintelligence measures, cohesion within the nation and among allies. These disruptive and cohesive measures are continuous and worldwide and designed to create the desired results within geopolitical objectives. In some geopolitical objectives the aim may be merely the disruption of the established social and political order by measures short of force. In other geopolitical objectives the aim may include disruptive measures, economic pressure, and a minor application of force. In still other geopolitical objectives all of the previously listed measures may be employed as well as limited warfare, accompanied by guerrilla warfare and disobedience of prisoners behind the lines of the opposing armed forces. Finally, at a time of supreme crisis, when conflict takes on the pattern of total war, all possible measures are simultaneously adopted to bring about the destruction of the enemy, and opposing intelligence organizations, like the forces they serve, become locked in a titanic struggle for supremacy.

The military intelligence organization of a great power of the modern world is fantastically complicated. The responsible individuals who conduct the day-by-day affairs of the tireless, sleepless military intelligence organization must understand the past to comprehend the present in order to influence the future. They are almost as diverse in their skills as civilization itself, for almost every aspect of human knowledge has a role to play in modern military intelligence.

Each nation has adopted a military intelligence organization appropriate to the peculiarities of the government and its civilian and military institutions and to its relative situation in the world. It is only natural, therefore, that the intelligence organization of a repressive regime should be highly centralized, extremely secretive, extraordinarily suspicious, and devious.

The narrower field of combat intelligence, which is of direct and immediate concern to all organizations or elements of the armed forces from the lowest to the supreme headquarters directing the combined operations of a vast coalition, has become infinitely more complicated than

ever before in history. It is at the strategic and tactical levels that deficiencies or failures in the military intelligence organization and in the use of military intelligence are most obvious. This is well illustrated by the failure of American authorities to properly utilize available military intelligence in 1941. This failure contributed to the Japanese success at Pearl Harbor on December 7. Then, as on other occasions, the major fault was not with the intelligence agencies but with the commander in chief and his principal assistants who were responsible for decisions based upon the military intelligence presented. This and other historical examples indicate that the mere production of timely and accurate intelligence, important though it is, cannot insure national or coalition security. Military intelligence can be effective only when it leads to prompt and correct decisions followed by decisive action.

Brigadier General United States Army, Retired;
Office, Chief of Military History, Department
of the Army.

MILITARY LAW. Distinguished from the law governing citizens in their relations to each other and to the state in their everyday affairs, military law is that which ordinarily governs the military establishment and which, under extraordinary conditions, may extend to government of the civilian populace and the civil machinery of the state. In the latter case it is known as martial law or military government, dependent upon the conditions under which it is invoked. As applied to the discipline and regulation of the armed forces of the United States, military law is operative in peacetime as well as in war. It is recognized as a distinct legal system by those clauses of the Constitution granting to Congress the power to make rules for the land and naval forces, exempting cases arising in the land and naval forces from the guaranty of jury trial in criminal prosecutions, and constituting the president as commander in chief. In this phase military law does not concern itself with rights of property or rights flowing from torts or contracts; its primary concern is the maintenance of good order and obedience among the members of the military establishment and the regulation of rights, obligations and status incident to such membership. It applies to the conduct of civilians to a very limited degree and then only through their direct relationship to the armed forces. An example is found in the case of civilians serving with the armed forces outside the continental limits of the United States and outside certain parts of the territories, made amenable by the uniform code of military justice.

Statutory military law applicable to the armed forces is found in the uniform code of military justice and in numerous other enactments of Congress regulating the organization and administration of the armed forces. Supplemental to the statutes is a great body of regulations and orders issued by the president by virtue of his powers as commander in chief or

by the president and his subordinates in implementation of the statutes. There exists, also, a considerable volume of unwritten military law consisting of the customs of the service and of decisions and opinions in particular cases from authoritative sources. Illustrative of such opinions are those of the judge advocates general of the army, navy and air force and of the court of military appeals, an appellate agency. Another body of usages, generally international in origin, constitutes the "law of war." The law of war represents the efforts of mankind to regulate and ameliorate the rigors of warfare. The conventions of The Hague and of Geneva are largely codifications of the law of war.

The uniform code of military justice embodies the substantive and adjective criminal law for the American officer and enlisted person. It provides for the form, establishment and procedure of military tribunals and denounces offenses of military and civil type. Military offenses so defined include, among others, desertion, fraudulent enlistment, absence without leave, mutiny, willful disobedience, sleeping on or leaving post, unbecoming or discreditable conduct and frauds against the government. Civil type offenses include, among others, murder, rape, robbery, larceny, forgery, assault, and burglary. Persons subject to military law are also subject to local civil law. For example, should a soldier rob a man on the street of a village of some state of the union, the wrongdoer would be subject to trial by court-martial and would also be amenable to trial in the civil criminal courts of the state in which the village is located. The uniform code of military justice authorizes delivery for trial, upon request, of any member of the armed forces accused of an offense against the civil law of the requesting authority. The jurisdiction which first attaches is, generally, entitled to proceed. In practice requests by the civil authorities for delivery to them of offenders of military status are exceptional and isolated. The rules as to delivery apply in time of war as well as in time of peace. Jurisdiction of military tribunals does not, in general, depend on where the offense was committed.

Members of the military forces who are separated from active service by discharge or similar measures normally cease to be subject to the punitive processes of military law upon such separation. The uniform code of military justice provides, however, that a member of an armed service who obtains his discharge by fraud may be apprehended and tried by court-martial for his fraudulent act and, if convicted, for any prior offense. Re-entry upon active service does not revive jurisdiction with respect to offenses committed prior to separation. Any hiatus during which the individual ceases to be subject to military law, although but momentary, suffices to bar trial. Mere change of status, such, for example, as discharge of an officer from a reserve commission in the regular establishment, which discharge does not involve a period of nonamenability, has no effect upon the continuance of military jurisdiction. The rule that separation from military service casts off amenability to processes of military courts is rooted in the constitutional conception of supremacy of the civil over the military power and in the traditional right of the citizen jury trial where accused of crime.

The military law follows the armed forces

of the United States when they go abroad. Whether the occupation by the forces of foreign soil in such an event is friendly or hostile the forces and their personnel are subject to military law. The United States has historically taken the position that the presence in a foreign country of its organized military personnel does not render the force or its individual members amenable to the law of the country occupied. In cases of friendly occupation, agreements by treaty or otherwise delimiting jurisdiction are invariably sought. Legislative enactments by the occupied countries implementing the agreements are not uncommon. This immunity from local law, known in its general scope as extraterritoriality (q.v.), is essential to continued control by the United States of its armed forces through its own laws. Most other nations assert the same immunity in behalf of their own forces. The millions of American troops located during World War II in England, Canada, Iceland, France, Africa, Italy, China, India, Burma, Australia, the Dutch East Indies, Japan, and elsewhere were governed solely by the military law of the United States.

Martial Law.—The term "martial law" or "martial rule," sometimes loosely used as the equivalent of military law, is, precisely, the law or body of rules applied as a matter of necessity in domestic areas when civil government fails to function and the armed forces are required to assume control until civil processes and courts can be restored to their lawful places. Martial law applies only within domestic territory as distinguished from occupied territory of an enemy recognized as a belligerent. In its pure form it is nothing more or less than the will of the military commander who, because of unlawfulness and turbulence, assumes control of an area for the time being. It is usually implemented through the simple device of supplying armed sanction to enforce the normal police and judicial activities of the civil government, disappearing as these activities become effective. It is oftentimes established by proclamation. Martial law, being an expedient resorted to only where there is no other operative law, is not recognized by the Constitution or by federal statute. Martial law has been proclaimed or otherwise established in the United States in numerous instances since the adoption of the Constitution. During the Civil War it was freely used in the border states as an instrument of control by the North where activities by sympathizers for the Southern cause resulted in uncontrollable disturbances. Suppression of disorderly and riotous conduct incidental to labor difficulties in industry was frequently accomplished during the early part of the 20th century through the medium of establishing martial law.

Military Government.—Military government, sometimes called the law of military occupation, is a term used to describe the authority exercised by the armed forces over domestic territory in close proximity to the enemy (falling short of martial law) or exercised by the armed forces of a belligerent over occupied enemy territory. Examples are found in the military government established by the Army of the United States over the territory of Hawaii during the imminence of Japanese invasion of that territory at the beginning of participation by the United States in World War II, and in the military governments established for the control of Italy,

Japan, and parts of Germany during the occupation of those countries incident to World War II. Military government does not transfer sovereignty but merely assumes the powers and duties and exercises the authority, in whole or in part, of the sovereignty. Its purpose is not only to establish law and order but also to insure the safety and dominance of the military power which sets it up. Except during the Revolutionary War the territory of continental United States has never been subjected to foreign military government save in one instance of such government by the British at Castine, Maine, in 1814-1815. Federal forces maintained military governments in some Southern areas during and immediately after the Civil War.

The military government may, and usually does, employ its own tribunals for administering civil and criminal laws in their application to the inhabitants of the occupied area. On the other hand, the military government may utilize such of the established courts of the civil government as may be expedient for administering its military government. Such of the municipal laws of the occupied territory as the military government deems necessary may be continued in force. The jurisdiction of a military government, so far as concerns its punitive application by military tribunals, is exercised through military commissions and provost courts. They are summary in their nature, following to some degree the rules of procedure and evidence prescribed for courts-martial. The international tribunals composed during World War II for the trial of so-called war criminals, the political and military leaders of the aggressor nations, were, in legal effect, instruments of military government. They were constituted by the highest executive authorities of the nations concerned in the prosecutions, whereas the military commissions and provost courts generally utilized are appointed by army or other subordinate commanders of the occupying forces.

Universally recognized civil type crimes of serious nature, such as murder, rape, robbery, and larceny, as well as violations of the law of war such as spying, relieving the enemy with money, food or other supplies, communicating with the enemy, sabotage of military installations, and aiding in the escape of prisoners of war, are normally punished under military government through military commissions. Minor offenses, such as violations of traffic and curfew regulations, petty larceny, cheating, and other offenses such as normally would be punished in the police courts of American cities, are punished by the provost courts.

Courts-Martial.—Courts-martial are essentially instruments designed for the disciplinary control of the military establishment. Civilians, even in occupied countries, are generally amenable to trial by courts-martial only where the persons affected are in fact incorporated into the armed forces. Trials for spying and for other violations of the law of war are exceptions. The composition, jurisdiction and powers of courts-martial, as well as limitations upon their processes, are prescribed by the uniform code of military justice and by regulations by the president incorporated in the *Manual for Courts-Martial, United States*. For detailed discussion of courts-martial see separate article MILITARY COURTS-MARTIAL.

European Military Law.—Military law, as

distinguished from the law normally applied by civil institutions and courts, is recognized by European countries in its martial law and military government aspects and in application of the law of war. It tends to merge with the civil power where the civil government concerned becomes authoritarian in form. Military government was administered in occupied enemy territory by England, France, and Russia, as well as by the United States, following the termination of hostilities of World War II.

MILITARY ORDERS. See ORDERS AND DECORATIONS.

MILITARY PENSIONS. See PENSION OR RETIREMENT SYSTEM—*Military Pensions and Compensation*.

MILITARY POLICE. In the United States Army military police units are assigned to commands as the requirements of an area or situation may dictate. Military police units are assigned to divisions and larger tactical units, to logistical commands in oversea areas, and to installations and commands in the Continental United States. The primary function of military police units is the maintenance of law and order, the protection of property, and the prevention and investigation of crime within the army. During the time of war, additional functions given military police units assigned to tactical units include traffic control; internment, care, treatment education, work, and repatriation of prisoners of war, restrained enemy aliens and refugees; protection of the inhabitants of the country from violence and excesses of all kinds; supervision of military and civilian personnel while traveling; collection and return of army stragglers; and control of circulation and identification of individuals. Additional functions given military police units assigned to logistical areas and the Continental United States include the operation of guardhouses and stockades; physical security of posts, camps, stations, and special facilities; apprehension of absentees and escaped military prisoners; and control of traffic.

Historical records indicate that since ancient times armies have used certain troops as police for the general welfare and protection of the common good. During the American Revolution, some units of cavalry, known as Light Dragoons, were designated to assist the "Provost Martial"

and perform other basic military police duties. Later, in the Civil War, the Union forces established a Provost Marshal General and Police Corps, both of which were abolished in 1866. In 1917, a Provost Marshal General was again designated and military police units established by the process of selecting a company and officially designating it as a military police company, or selecting so many men from each of several units to form a military police company. Since 1941, however, the United States Army has had an established military police corps of specially selected and trained officers and men. The Military Police Corps is now a permanent and basic branch of the army.

The police force of the United States Navy is the Shore Patrol. See NAVAL TERMS—*Shore Patrol*.

MILITARY PRISONS. Military prisons in the United States are used for the confinement of military offenders who have been sentenced by courts-martial to dishonorable discharge from the army and a period of confinement, but whose offenses are not so serious as to require confinement in a federal penitentiary. The largest military prison in the United States is the United States Disciplinary Barracks at Governors Island, N. Y. A military offender whose adjudged period of confinement is relatively short is incarcerated in the guardhouse in the fort where he is stationed.

The mission of military prisons is the reformation and rehabilitation of the inmates. Such policies and measures are adopted as will tend to correct faulty habits and erroneous inclinations of prisoners, improve their economic prospects, and increase their respect for social and moral laws. The definite purposes are: first, to restore to an honorable duty status in the army those who demonstrate their fitness for further service; second, to discharge the remaining offenders in the best possible condition to meet successfully the duties and obligations of a good citizen.

CHARLES E. CHEEVER,
Major, Judge Advocate General's Department,
United States Military Academy.

MILITARY PUNISHMENTS. See MILITARY LAW; ARREST, MILITARY; MILITARY COURTS-MARTIAL.

MILITARY RAILWAYS. Military railways include all railways under military control in the theater of operations, and all those which have been turned over to military authorities in the zone of the interior. The War Department is responsible for maintenance and operation of these lines and for the construction of new trackage and facilities.

Ordinarily, railways are superior to any other form of land transportation for bulk movement of troops and supplies over distances greater than 75 miles. Therefore, railways constitute the backbone of the transportation system supplying a military force. Since railway construction is a slow process, location of lines may be of great strategic importance, and most countries lay out their peacetime transportation systems with a view to their employment in war. The distance within which railway operation may approach the battle front varies within wide limits and depends upon the prevailing

conditions. It tends, at the present time, to be greater than formerly, due to the capabilities of modern artillery and bombing planes and also because of the increased effectiveness of motor transportation. In a stabilized situation, railheads may be about 20 miles behind the front. At the end of a rapid advance, this distance may be 200 miles or more. Ordinarily there is no advantage in employing narrow-gauge railways to supplement the transportation net except in the case of permanent fortifications.

Problems of Operation.—The basic problem in operating a military railway system for supply of the troops in a theater of operations

vary from siding facilities for about 12 cars, to several sidings of 1,500 feet or more. In some cases, dead-ending of the line will be sufficient for siding purposes.

Division and Control.—Construction, operation, and maintenance of military railways in a theater of operations is controlled by the commander of the theater and his staff. However, technical operation and maintenance is carried out by the communications zone. The engineer on the staff of the commander of the communications zone is the *director of military railways*. Directly under him there is the *manager of military railways*, ordinarily a railroad executive in civil life, who is in direct charge of all operation and maintenance. The railway system is organized into one or more *grand divisions*, each composed of a grand division headquarters, railway shops, and two or more *railway divisions*. A division may vary from 50 to 150 miles in length of line, depending on conditions. Military personnel, organized into special railway operating and shop battalions, may carry on the work. In this case, an operating battalion operates one railway division. However, it may be possible to utilize for at least part of the work the civilian personnel of the railroad. In this case, the personnel may or may not retain civilian status. Construction work and reconstruction of an extensive nature is not accomplished ordinarily by the special railway units such as the operating battalion, but is done by the general engineer units, working in the communications zone or army service areas.

Principles of Operation and Engineering.—Military railways are operated generally on the same basic principles as those prevailing in civil practice. However, there are certain distinct differences. There is greater emphasis on economy of men, materials, labor, and time

Typical Railhead for Serving a Single Infantry Division

is to receive the supplies from the zone of the interior and transport them to the using troops. Necessarily, this is a complicated matter, since the supplies are received in carload lots in very large quantities and must be transported to the troop units where these happen to be at the time. Also, the amount of supplies required depends considerably upon the nature of the operations being carried on. These conditions ordinarily require that the supplies first be transported to large *general depots* in the communications zone where they are received by the supply services in order to be sorted and administered and from which they can then be reshipped as needed by the troops. The agency for ordering the reshipping and for regulating the flow of supplies into the field army areas

Typical Regulating Station Layout

is the *regulating officer*, a general staff officer, reporting to the general headquarters. One of these regulating officers will operate normally in rear of each field army at a *regulating station* forward of the general depots, and will give the necessary instructions to the supply services involved and to the military railway service. The military railway service then transports the supplies forward to the railheads. The regulating officer also controls all movement of troops by railway forward of the regulating station.

General depots require very large yards consisting of receiving, classification, storage, and departure tracks, and unloading and loading facilities. A regulating station serving an army will usually require a similar but much smaller installation. For an average station, about 25 tracks, each 1,500 to 2,000 feet in length, would be required. Requirements for railheads may

at the sacrifice of personal comfort, convenience, and speed of movement. Also, prompt completion of any new work is of primary importance, and earthwork is reduced to a minimum at the expense of mileage, curvature, and gradient. Roadbed and track are as light as is consistent with contemplated use. Safety, to some extent, is subordinated to military necessity. Constant surveillance of trackage and bridges is required and greater maintenance must be expected.

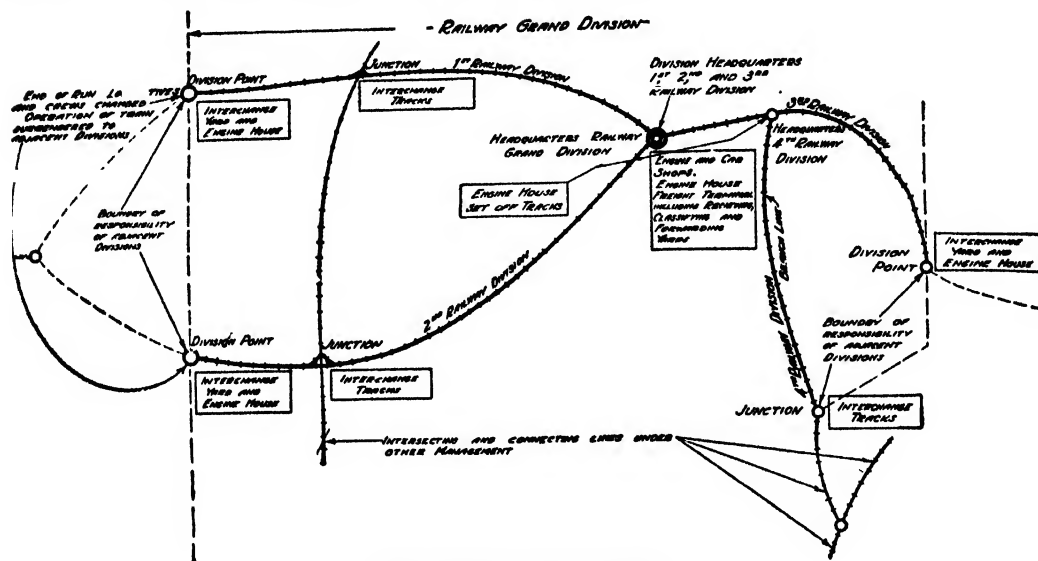

Desirable characteristics of a military railway system from an engineering viewpoint are: (1) yard, terminal, and shop facilities well located; (2) double or multiple track; (3) seasoned roadbed, heavy rail, and good ballast; (4) light grades and curvature; (5) adequacy of passing tracks and sidings; (6) bridges adequate for military loads, including railway artillery; (7) ample loading, unloading, and storage facilities where needed; (8) reasonably

MILITARY RAILWAYS

short mileage between important points; (9) a line not subject to damage from natural causes or particularly vulnerable to attack from the air; (10) additional lines making detour plans possible; and (11) ample supply of suitable rolling stock.

Capacity.—The capacity of a single-track main line railroad for military purposes is expressed in terms of the feasible movement of

cars, flat cars, coaches, and cabooses. Box cars may be used for men, supplies, equipment, or for animals. Stock cars are preferable for the latter if substitution is feasible. If commercial freight cars are employed for the transportation of men or animals, special precautions for ventilation are necessary. Flat cars usually are employed for the movement of wheeled vehicles, tractors, field guns, and similar equipment. They

Typical Railway Grand Division

trains per day, as: "six 30-car trains per day, each way between X and Y, with individual train loading not in excess of 1,500 tons." The capacity of the line as thus expressed is fixed by the speed of operation under existing conditions and characteristics of the line, and by the length of the existing passing tracks which fix the number of cars per train. Under military conditions the capacity of a line is generally about as follows: a single-track line in good condition, with a ruling grade of one per cent and passing tracks at 6 to 10 mile intervals, will allow passage of 10 trains each way per 24 hours, the maximum length of trains being fixed by the clear length of sidings, and the maximum tonnage of train not exceeding 1,500 tons. Where the ruling grade exceeds one per cent, the number of trains would not necessarily be changed, but the ton-mileage would probably be reduced. On double-track line the ton-mileage is correspondingly affected by the controlling grade, but the number of trains which may be dispatched over the line per day is usually not so dependent upon conditions of the main line as upon facilities for dispatching and receiving trains at the terminals. To estimate the capacity of a given terminal, the procedure is to measure the total length of track in either the receiving or the classification yard expressed in feet, divide by the average length of cars to get the approximate car capacity of the yard, and assume that two-thirds this number of cars can be handled through the terminal in 24 hours.

Transport Trains.—The logistical planning of troop movements is facilitated when use can be made of so-called standard trains. These are made up in two general types from box

cars, flat cars, coaches, and cabooses. Box cars may be used for men, supplies, equipment, or for animals. Stock cars are preferable for the latter if substitution is feasible. If commercial freight cars are employed for the transportation of men or animals, special precautions for ventilation are necessary. Flat cars usually are employed for the movement of wheeled vehicles, tractors, field guns, and similar equipment. They

should be placed end to end in a train, preferably just ahead of the caboose. A coach is provided for officers. Loading of animals or vehicles is best accomplished by the use of ramps. For animals, the ramps are usually constructed of timber with a cleated floor. To load vehicles, an end ramp on the last flat car is normally employed. Cross-overs between cars are provided. A suitable ramp can be provided by building a crib support under short treads from the ground up to the car floor. The disadvantage of this type is the steepness of its slope, which requires the use of block and tackle. Better results can be obtained by removing the rear truck from the last car, thus letting the end of the car down to the ground.

Due consideration must be given to the placing and securing of the loads on flat cars. Arrangements must not interfere with train operation or create undue hazards for operating personnel; loads must be securely fastened so that no shifting will occur in transit; and the loaded car must be able to clear all possible obstructions, such as tunnels and bridges. Loads must not exceed the capacity or strength of the car, and must be placed symmetrically with reference to its longer axis. Very long loads, such as large gun barrels, may be carried by two or even three cars. When three cars are used, the load is supported by the two end cars, and the middle car is an idler. Loads may be secured to the car by hardwood stakes, braces or cleats, and by bolts, rods, wire, lashings, or steel bands. Vehicles must be held securely in place by blocking cleats and also, if necessary, by lashings. In the case of large

gun carriages or heavy trucks, the lashings can be drawn tight by deflating the tires, taking up the lashings, and again inflating the tires. See also, ARMY TRANSPORTATION SERVICE; MILITARY TRANSPORTATION; SUPPLY RAILWAYS.

MILITARY SCIENCE. That field of observation, investigation, and analysis of military and related affairs that has for its object the determination of principles or rules to govern the conduct of military operations. The correlation and practical application of the deductions of military science comprise the art of war. Thus, war is both a science and an art. Military science is perhaps the most difficult of the sciences and it is also the most flexible. In its study, the actions of men which are variable and, at times, unpredictable play an important role. Further, there are limitations inherent in the field of observation. The effects of weapons and the capabilities of equipment can be measured and tested in maneuvers jointly with ideas of organization and tactics. Yet, while helpful, these measures cannot produce conclusive deductions. The atmosphere and urgency of war, the actions and reactions of men, and the unexpected frictions which arise in the actual conduct of battle are not present. The battlefield alone is the true testing ground, but civilized nations do not engage in war for the sole purpose of testing weapons, equipment, and theories. There remains then as the principal field for study and analysis the conduct of past battles and campaigns. Here further complexities are introduced, for no two battles or campaigns are ever the same even though they may look so. The morale, condition, discipline, and competence of men, the efficiency of their leaders, weather, terrain, weapons differences, and other factors all exert influences that are not readily apparent. So the "facts" set forth by accounts of eyewitnesses and participants, which form the basis of recorded military history, may not present accurately the realities of conditions. Eyewitness accounts are based on individual interpretation, and the actual participants having been subjected to stress and excitement may not be able to reproduce the true circumstances or avoid rendition of biased accounts. In brief, military science cannot be an exact science. Despite these inherent complexities, military science has synthesized its main conclusions into a series of generalizations known as the *principles of war* (q.v.). These are few in number but their truth has been demonstrated throughout the history of warfare. More than half of the present-day principles were postulated in 505 B.C. by the Chinese philosopher Sun Tzu. These principles and the few added later have remained unaltered, but the doctrine and techniques of their application have undergone successive changes wrought by new military developments and the products of other sciences. The wheel, the catapult, the crossbow, gunpowder, the rifle, artillery, field fortifications, the railroad, signal communications, mass production, motor transportation, chemical agents, the tank, the airplane, guided missiles, and finally atomic weapons each in turn caused modifications in military theory and practice and in the practical application of the principles of war. Stubbornness in adhering to tradition and failure to recognize the true military potentialities of new means have been the basic causes of many military reverses. Blind, rigid adherence to the principles of war also has produced disastrous results, for these are useful

tools of the military art only when applied with a true appreciation of the circumstances affecting the conduct of war prevalent at the time: the capabilities and limitations of weapons and equipment of the day, psychological and geographic considerations, time and space and other factors. During and since World War II, technological advances affecting the tools of war have been great, particularly in fields that eliminate or minimize human influence. The normal methods of scientific approach are becoming more applicable to military science. Groups containing scientists of many fields have been organized in the military services to study military operations, tests, trials, and maneuvers scientifically, quantitatively, and qualitatively with the view to improving future strategy, tactics, and weapons. Actual operations in Korea were subjected to on-the-ground study and analysis by these groups. Their activities are known alternately as *operations research*, *operational research*, *operations evaluation*, and *operations analysis*. In the highest echelons similar studies are being made of entire weapons systems of the separate services and their mutual relationship. In the United States these studies are conducted by the Weapons Systems Evaluation Group of the Department of Defense. The branches of modern military science are many and varied. The main branches are: AIR SUPPORT; AMMUNITION; CHEMICAL, BIOLOGICAL AND ATOMIC WARFARE; LOGISTICS; MILITARY EDUCATION AND TRAINING; MILITARY ENGINEERING; MILITARY HISTORY; MILITARY INTELLIGENCE; ORGANIZATION; RESEARCH AND DEVELOPMENT; SIGNAL COMMUNICATIONS; STRATEGY; TACTICS; WEAPONS; WELFARE, RECREATION AND MORALE.

MILITARY SERVICE INSTITUTION OF THE UNITED STATES, a society of officers of the United States Regular Army, organized in 1878 by Generals James B. Fry, David S. Stanley, Colonels T. F. Rodenbough, G. N. Lieber, and others. It was designed as a similar organization to the Royal United Service Institution of Great Britain. The presidents of the American society included Generals W. S. Hancock, J. M. Schofield, Nelson A. Miles, and T. H. Ruger. The headquarters were at Governors Island, N. Y., where the institution at one time had a library of 20,000 volumes, including many rare documents. The society issued *The Journal of the Military Service Institution*. It is no longer in existence.

MILITARY SURGERY, or war surgery, treated formerly as a specialty pertaining only to the surgery performed by army surgeons in war areas, now has no such implication and the term in that sense is of interest only in historical medicine. (See SURGERY.) At present military surgery is included in the general category of war surgery and refers to injuries sustained in war by those engaged in the armed forces, whether ground, naval, or air, as well as to casualties sustained by civilians in the zone of hostilities. It has also some reference to medical conditions such as shock, psychosis, and prophylactic measures of various kinds, which also may be referred to as military medicine, if there is to be a strict separation of medicine from surgery. The experience of the United States and its allies in World War II and those of the campaign in Korea have been used largely as a basis for this article.

The sharp distinction that once existed between the military surgeon and his brother in civil life has long since disappeared and military surgery now is no different from civilian surgery, except that much of it is produced by the machinery of war, and the care of the injured is often dependent upon the terrain and the facilities that are available. The weapons and missiles of war are extremely varied. In the case of ground troops these may be small arms (rifles and machine guns), grenades, shells of all sizes and types, flame projectors, and, where hand to hand fighting takes place, bayonets and knives. The type of wound will vary with the weapon or missile. Injuries sustained by air force personnel are generally from bullets and shell fragments, and from burns. Among naval personnel flash burns, shell wounds, and lung injuries following immersion are common. The successful care of battle casualties is largely a matter of proper planning, adequate equipment, and teamwork on the part of all concerned.

Our present knowledge of modern war surgery dates from the conflict known as World War II, and for those in the United States it began on December 7, 1941 at Pearl Harbor. World War II casualties differ from those in all previous wars in that the civil population was subjected to bombing and other attacks hitherto unknown. New types of ammunition appeared, and bombing, the presence of large mined areas, booby traps, aviation bombs, rockets, and bazookas made moving, or even living, in the war areas extremely dangerous for troops and civilians alike.

Physical Effects of Modern Warfare.—These may be listed as: (1) wounds; (2) compound fractures; (3) burns; (4) closed cavity injuries (brain, chest, abdomen); (5) suffocation and submersion. To these should be added an injury common under conditions of extreme cold, freezing. In all cases shock, hemorrhage, and infection threaten the injured person with disability, deformity, and death. Many war casualties end immediately, or within a few hours, in death. Such especially are those involving the great vessels, as the aorta and vena cava. The protection afforded in recent years by helmets, bullet proof jackets, and asbestos clothing has reduced mortality from head and chest wounds and from burns, which was extremely high in World War II. On the other hand, insufficient protection from the elements, in the Korean campaign, was responsible for a great number of disabling injuries from freezing of the extremities.

First Aid and Surgical Treatment in the Battalion.—To comprehend the role of the military surgeon in battle one should understand the conditions usually present in the battle area. First aid and surgical treatment, except that which the soldier can give himself by using his first aid packet, begins at the battalion aid station. This must be located where the maximum number of casualties will pass in the stream of evacuation toward rear areas and it should not be placed too far forward. If the aid station is pinned down by machine gun or artillery fire it cannot function. At the station antibiotics are given, shock treatment administered, and certain definitive surgical measures are employed just as in civil emergencies but with some limitations and differences. In warfare the types of wound are different, the time between injury

and definitive treatment may be long, and most serious of all, evacuation may be delayed. In modern warfare many casualties may occur in non-military persons. Bombing and strafing activities of the enemy air force may result in a large number of casualties in rear areas which may not be well prepared for their prompt care.

The target areas of the body may be assembled into 4 main groups which are given here, with the percentages involved. They are: (1) head, face, and neck, 8.51 per cent; (2) upper extremities, 20.15 per cent; (3) trunk, 28.9 per cent; lower extremities, 41.45 per cent (World War II). Wounds of the extremities constitute about 75 per cent of all wounds. The types of wounds change with each war. High explosive shells, bombs, and mines now cause more severe hemorrhage, shock, and cardiorespiratory disturbance than in any previous wars. Many casualties in battle are not due to explosives or missiles and the battalion surgeon may be called on to care for those injured by falls from cliffs, by falling trees, and by motor vehicles. In general, it has been stated that if the battalion surgeon is able to care for the wounds of the extremities he will have looked after three fourths of all the casualties that will pass through his station.

When a man is wounded in action he is located by the company aid man or the litter team of the aid station. A sterile first aid dressing is applied to the wound, which protects it from irritation and infection as well as lessening the pain. When the man arrives at the aid station, either walking or on a litter or other device, his dressing may be replaced, clothing cut away, and, if the wound is extensive, a large vaseline dressing may be applied. Irrigation may or may not be indicated. Proper bandaging is most important. A copious, heavy bandage is a great protection when the man is moved to a rear area. All aid station men are trained in the emergency care of wounds. Shock is best treated by preventive measures and should be anticipated from the nature of the injury. Early immobilization of fractures, early use of whole blood and plasma, and early employment of morphine for pain, often prevent shock from developing.

Head and face injuries may result in fatality within hours or even minutes. If the patients survive as long as 6 hours, the majority recover from the immediate effects of the injury. Every scalp injury, no matter how trifling, is a potential wound of the skull. Many penetrating wounds of the skull are encountered in walking wounded. In neck injuries with a fracture of the spine, slight traction and heavy bandaging is advisable and great care should be exercised in moving the injured man. Wounds of the chest cause death in 1.4 per cent of the deaths in action. In penetrating wounds of the chest about three quarters have hemorrhage into the pleural cavity and about one third of these become infected. Early evacuation of these cases saves many lives.

Fractures of the dorsal and lumbar spine must be moved carefully, preferably using three aid men. The back must not be jackknifed by sitting the patient upright, and he should always be moved on a litter that is heavily padded with blankets. Fractures of the pelvis should be moved on a litter whenever possible. All abdominal wounds are given a first aid dressing,

the knees are flexed, nothing is given by mouth, and the wounded man is tagged with a high priority evacuation to a rear area hospital. Fractures of long bones are carefully and adequately splinted before being moved. In cold climates the greatest care should be exercised to prevent chilling or freezing.

The Campaign in Korea.—Certain facts regarding the Korean campaign are presented here. It is to be understood that much of the surgical history of that struggle is not yet available for general reading and study, but enough is available to afford comparison with other wars. As far as military surgery goes, that does not differ materially from the surgery of other wars except that in reduction of mortality the following factors exerted a considerable influence: increased use of chemotherapy and antibiotics; increased use of body protective devices; great increase in teamwork in forward areas; evacuation of wounded in great numbers by air.

Certain statistics and methods of treatment are noted briefly as of interest, even though the number of those engaged was infinitely smaller than in World War II. In considering the battle casualties in the Korean theater the period from September 2, 1950 to February 28, 1951 (about 18 months) has been selected. In this period there were 41,951 battle casualties with 7,017 deaths. A total of 12,908 persons were evacuated to the United States for definitive treatment. Of these 169 were amputations; 271 required neurosurgery; 71 were deaf; 6 were blind; and 7,448 required general and orthopedic surgery. The remainder were distributed among a large number of categories including medical. These figures indicate that considerably more than half the cases did not require evacuation to the home territory but were handled in Korea and Japan.

Types of Operation Performed.—*Craniotomy*.—In a series of 123 cranial operations the indications were for injury to cranionasal sinuses, transventricular wounds, venous sinus injury, and brain abscess. Penicillin was used freely. In 40 per cent of the cases dural transplants were required for closure.

Intrathoracic Wounds.—In a group of 6,333 casualties from all types of missiles there were 834 chest wounds of which 8.5 per cent were intrathoracic. About 75 per cent of these were complicated by blood in the chest cavity (hemothorax), retained foreign body being next with 20 per cent of cases. Injury to the heart was reported in only 1 per cent of all cases.

Maxillofacial Injuries.—These were numerous. The treatment involved primary wound debridement with chemotherapy and administration of antibiotics (penicillin and streptomycin), continuous wet dressings, removal of contaminating food debris, and stabilization of fractures. Tracheotomy was employed freely (119 cases), a life saving measure. Complications in maxillofacial injuries were infrequent and were principally empyema and secondary hemorrhage.

Burns.—The exposure method was utilized freely in a series of 200 burned patients. After 72 hours the injured dermis becomes dehydrated, contracts, and becomes a dark brown eschar. In about 14 days the eschar is removed and the area is ready for grafting. The exposure method follows the procedure outlined: (1) cleansing of the surface by washing gently;

(2) removal of debris; (3) administration of antibiotics; (4) exposure to room air; (5) placing the patient at rest; (6) elevation of the injured area to avoid edema. This method was used in hospitals in burns of the face, neck, hands, extremities, and trunk. The healing time averaged about 16 days. As a rule, where burns covered 60 per cent of the body area the patient died.

Evacuation.—In about 30,000 cases 24,000 were sent out by air and the remainder by ship.

Cold Injury.—There was a high incidence of cold injury, and 630 cases were reported from Korea. Amputation was required in many instances. About 15 per cent of the injuries from cold resulted in some permanent disability.

General Battlefield Surgery.—Mobile army surgical hospitals were in use. These had been prepared to do all types of major surgery. The unit was organized into 2 sections, administration and professional. An ambulance company and a helicopter unit were often in attendance. The mobile surgical unit is especially adapted to cases which cannot be moved until life saving measures have been instituted.

Colonel, United States Army Medical Corps
(Retired).

MILITARY TERMS. From the thousands of military terms in use, the following have been selected as those most generally used by writers and radio announcers on military subjects. Although each term was chosen for its military significance, most of the terms may also be used in a general sense.

Abatis.—Obstacle formed of felled trees, or of bent down small trees, often interlaced with barbed wire. The former is called a dead abatis and the latter a live abatis.

Absent Without Leave.—Failure to be at the proper place at the proper time, but without intending to desert the military service. The absentee may be unaware that his absence is not authorized. Abbreviation AWOL.

Accrued Leave.—Total amount of leave of absence due an individual in the military service at any given time.

Action Station.—Place to be occupied and duties to be performed by an individual in the event of an air attack.

Activate.—Constitute a military unit on the active list by assigning personnel and equipment thereto with which it can operate as a distinctive organization.

Active Duty.—Military service performed by those on the active list; includes those performing military or naval duties.

Adjustable Pitch Propeller.—Airplane propeller, the pitch of whose blades can be changed by the pilot while in the air.

Adjustment of Fire.—Determination of corrections in elevation and deflection of a gun or the moment of explosion of its projectile, and their application in firing, so as to place the gunfire on a certain part of the target.

Advance by Bounds.—Move forward in a series of separate advances, usually from one concealed position to another, or from one point of observation to another.

Advance Guard.—Force sent out ahead of the main body to protect it from surprise attacks and to insure its uninterrupted advance by removing obstacles and wiping out enemy resistance where possible.

- Aerial Torpedo.**—Large explosive projectile driven by its own motor, and usually launched from low flying aircraft at water-borne targets.
- Aid Station.**—First medical establishment on the route of evacuation from the fighting zone to which wounded are brought. The wounded are given first aid treatment and separated into groups. Those needing further care are sent to the rear.
- Air Superiority.**—Greater number or superior types of military aircraft possessed by one force that allows air or ground operations in a particular area without effective opposition by enemy aircraft.
- Airborne.**—Transported by air or in the air. Airborne troops are soldiers specially organized, trained, and equipped for transportation into combat by air. They usually land by parachute or glider.
- Aircraft Warning Service.**—System established for reporting the movement of aircraft to the air defenses. The system includes observers, filter centers, and communications.
- Alert.**—Warning signal of a real or threatened danger, usually an attack, time during which troops are on the lookout for danger, condition of aircraft prepared to immediately perform a mission.
- Alignment.**—Formation in a straight line; the line so formed; straight line on which several elements are formed; the dressing of individuals or units upon a straight line.
- All-around Traverse.**—Gun, radar, or other equipment capable of being turned by its traversing mechanism in a complete circle in a horizontal plane.
- All-Clear Signal.**—Signal to indicate that danger, usually an air attack, has passed.
- Allotment.**—Portion of their pay that military personnel may authorize to be paid directly to another person, as a dependent, or to an institution, as a bank or insurance company.
- Allowance.**—Prescribed amount of rations, supplies, or equipment allotted to an organization or to an individual. Monetary remuneration in addition to the previous allowances.
- Alternate Position.**—Location assigned to a unit, weapon, or piece of equipment from which the same mission can be accomplished as when located at the main position. The alternate position is occupied when the main position becomes untenable.
- Angle of Approach.**—In gunnery it is the angle between the line along which the gun is pointed and the line along which the target is traveling.
- Antipersonnel.**—Explosive charges, such as antipersonnel mines and antipersonnel bombs, designed to be used against individuals rather than against materiel.
- Antitank.**—Explosive charges, weapons, and other devices, such as antitank bombs, antitank mines, antitank grenades, antitank rockets, antitank guns, and antitank ditches, designed to be used against tanks and other armored vehicles.
- Area Target.**—Target for gunfire or bombing covering a considerable space. It differs from a point target in that the latter is a particular point or structure.
- Armor-piercing.**—Bombs, shells, rockets, and grenades designed to pierce armor.
- Armored Car.**—Motor vehicle protected by light armor and provided with machine guns or small caliber cannon. Used chiefly for scouting, but also as self-propelled mounts for antiaircraft artillery and as personnel and ammunition carriers.
- Articles of War.**—Laws governing the conduct of military personnel and others temporarily attached to the army.
- Artificial Moonlight.**—Use of searchlights to provide illumination for ground operations carried out during the hours of darkness.
- Assault.**—Final phase of an attack; closing with the enemy in close combat. It may be made by dismounted, mounted, mechanized, or armored units.
- Assembly Area.**—Location in which parts of a command are assembled in preparation for further action. Also called assembly point, and assembly position.
- Assign.**—To permanently place in a military organization so as to make the individual, unit, or item of equipment an organic part thereof.
- Atomic Energy.**—Release of power through a sustained neutron chain reaction resulting from nuclear fission.
- Attach.**—To temporarily place in a military organization an individual, unit, or item of equipment.
- Attack.**—Offensive action against an enemy. Usually involves an advance combined with firing and fighting at close range.
- Autobahn.**—German word meaning superhighway for automobile traffic.
- Automatic Fire.**—Fire from an automatic weapon which is continuous until the ammunition is exhausted or until the pressure on the trigger is released.
- Axis.**—Route of advance or supply toward the enemy or route of evacuation of personnel and materiel to the rear.
- Azimuth Deviation.**—In gunnery, the difference between the azimuth from gun to target and the azimuth from the gun to the point where the projectile strikes.
- Bail Out.**—To make an emergency jump, with a parachute, from an aircraft in flight.
- Ball Turret.**—Ball-shaped projection on aircraft containing guns and power driven to enable them to be quickly aimed in various directions.
- Ballistic.**—Pertaining to the motion or hurling of missile weapons; as ballistic curve and ballistic wind.
- Balloon Barrage.**—Protective screen of balloons anchored to the ground or to ships, to hinder flights by aircraft at low levels over a certain area or point.
- Band of Fire.**—Belt of fire, at least part of which grazes the ground; usually fired from more than one automatic weapon.
- Bangalore Torpedo.**—Metal tube containing a high explosive; principally used for clearing a path through a mine field or barbed wire.
- Barrage.**—Prearranged concentration of artillery or automatic weapons fire on one or more lines. Often used to isolate a portion of the front to prevent its reinforcement or attack.
- Base.**—Installation from which a military force operates, and from which it obtains its supplies.
- Base Angle.**—Angle between the line from the gun to its principal target and the line from the gun to the visible reference point, from which angles to other targets are measured.
- Bazooka.**—Portable launching tube for rocket projectile. Two men usually carry the ammunition and launcher and serve as the firing crew. It is used chiefly against armored vehicles. See article **ROCKET**.
- Billet.**—Shelter for military personnel that consists of buildings other than barracks.
- Biological Warfare.**—Employment of bacteria, fungi, viruses, rickettsiae, and toxic agents derived from living organisms to produce death or disease in humans, animals, or growing plants.
- Bivouac.**—Temporary camp in the field. It may have no overhead cover, or only natural cover, shelter tents, or cover made from available material.
- Black Out.**—To obscure in darkness, as by extinguishing all lights as a protective measure against enemy observation.
- Blast Effect.**—Destruction or damage to the works of man or vegetation on the surface of the ground or water caused by the force of an explosion on or slightly above the surface.
- Blitzkrieg.**—German word meaning lightning war. Violent surprise offensive by coordinated air, armored, and ground units, designed to quickly crush all enemy resistance.
- Blockade.**—Shutting out a place or enemy troops by the use of troops and/or warships to prevent ingress and egress; force maintaining a blockade.
- Blowback.**—Gases forced to the rear of a gun when a projectile is discharged. Blowback is a necessary part of the firing action in some automatic weapons. In other weapons it is usually the result of faulty ammunition.
- Bomb.**—Receptacle, usually of metal and streamlined in shape, containing a chemical agent and/or an explosive charge. Explosive bombs are usually demolition bombs for the destruction of heavy material and fragmentation bombs to cause casualties among personnel. Chemical bombs include incendiary, gas, and smoke bombs. To drop bombs from an aircraft.
- Bomb Bay.**—Portion of the interior of a plane designed for carrying large bombs. Bombs are carried in a device known as a bomb rack. They may be dropped from the plane when the bomb door is opened and the bomb release mechanism is actuated.
- Bombing.**—Act of dropping bombs from an aircraft. Bombing is classified into skip, dive, or glide bombing according to the performance of the plane at the time of release. Bombing is further classified into area, pattern, or precision bombing according to the method used in hitting the target.
- Bracket.**—In gunnery, space between two shots or group of shots one of which is over the target and the other

short of it. Normally, the third shot or group should be very close to the target.

Break-through.—Penetrating into and beyond an enemy defensive position with a force sufficiently large to continue on for a considerable distance.

Bridgehead.—Position on the enemy's side of a stream established by the leading elements of a force to protect the crossing of the remainder of the troops.

Brief.—Concise instruction given to participants of an air, ground, or sea mission immediately prior to departure.

Burst Interval.—Distance between the target and the point of explosion of the shell.

Cadence.—Uniform length of step and time in marching. Number of steps marched per minute.

Call Sign.—Signal used for identifying a radio station or a telegraph station. The radio station may be in a ship, an airplane, a tank, a truck, or immobile on the ground. Each station is assigned a different call sign.

Camouflage.—Disguising of an individual or a military target so as to deceive the enemy as to its existence or true nature by the use of nets, burlap, paint, foliage, etc. It also includes the placing of dummy targets.

Capital Ship.—Large size warship mounting guns of more than 8-inch caliber; battleship or battle cruiser. An aircraft carrier is not classified as a capital ship.

Cartel.—Written agreement between opposing nations, usually for the exchange of prisoners or the passage of mail and supplies through a blockade.

Ceiling.—Top limit of visibility for flying as determined by a cloud bank or fog. Highest altitude an aircraft can attain under certain conditions.

Censorship.—Act of inspecting and, if necessary, deleting all or part of written and printed matter; telegraph, telephone, and radio messages; radio broadcasts; still and motion pictures to prevent military information from reaching the enemy.

Center of Resistance.—Location in the main defensive position at which troops are concentrated to repel enemy attacks. Centers of resistance are part of a system of mutually supporting defense areas or fortified tactical localities.

Central Control.—System of fire control of weapons from a central location often used by antiaircraft batteries.

Chain of Command.—Series of officers and noncommissioned officers, in the military service, through which orders or other instructions must be transmitted from a senior to a junior.

Chemical Agent.—Chemical substance used in combat, such as poison gases, incendiaries, and screening smokes.

Chemical Warfare.—Use of chemical agents in combat. Bombs, shells, grenades, smoke generators, and flame throwers are used to disperse chemical agents against the enemy. Gas masks, special clothing, and decontaminants are used to neutralize chemical agents.

Chief of Staff.—Senior staff officer in a unit as large as, or larger than, a division who is in charge of coordinating the duties of all staff sections and is an adviser to the commanding general.

Classified.—Pertaining to the security restriction placed on military letters, messages, maps, publications, photographs, drawings, and motion pictures. The classifications, in order of importance, are top secret, secret, confidential, restricted, and unclassified.

Close Order Drill.—Drill formations and movements usually performed in drill, marching, and parades at normal or at close interval.

Coastal Force.—Naval force operating in a certain area as an aid in situations where the local naval defense forces are not sufficiently strong.

Coastal Frontier.—Geographical division of a coast to insure effective coordination between the armed forces of the nation defending the coastal area.

Color.—Flag of a nation; also the flag of a military unit comparable in size to a regiment. When both are carried together they are called the colors.

Combat Drill.—Drill formations and movements designed to train small units for combat. Usually conducted at extended intervals and distances.

Combat Troops.—Soldiers specially trained and equipped for actual fighting, as distinguished from service troops who provide supply, transportation, communication, evacuation, maintenance, construction, and other services for combat units.

Combat Zone.—Area where fighting is actually taking place; forward part of the theater of operations.

Combined Operations.—Military action carried out by two or more nations in concert. Military action by

army and naval forces acting together is called joint operations.

Combined Training.—Maneuvers together of two or more branches of the army that normally fight together, such as infantry, artillery, engineers, armor, and air units.

Command Net.—Electrical means of communication over which orders are sent to the headquarters of units. These means include radio, telegraph, and telephone.

Command Post.—Headquarters of a military unit; location of the commander. In combat the command post is often divided into a forward and a rear echelon.

Commando.—Soldier specially trained to make surprise raids in small groups. This is the British term; the corresponding American term is Ranger.

Compartment of Terrain.—Separate division or section of the ground founded on at least two sides by features, such as woods, ridges, or villages which limit observation and observed fire into the area from points outside.

Cone of Dispersion.—Space through which pass a group of shots fired from the same gun with the same sight setting. The cone-shaped dispersion is caused by vibration, ammunition variances, and other factors.

Correspondent.—Writer, photographer, artist, or radio broadcaster authorized to collect and disseminate information in a theater of operations.

Corridor.—Compartment of terrain the longer axis of which extends in the direction of advance, or is parallel thereto.

Corvette.—Small war vessel used to protect convoys from submarines.

Counterattack.—Attack made in reprisal for an enemy's attack. It is mostly a defensive action and differs from a counteroffensive, which is aggressive action on a large scale.

Counterbattery Fire.—Artillery fire intended to destroy the enemy's artillery.

Counteroffensive.—Aggressive action on a large scale to seize the initiative from the enemy. It differs from a counterattack in that the latter is a small local action.

Court-Martial.—Military court. The three kinds, classified according to importance are general, special, and summary.

Cover Position.—Location immediately in rear of a firing position in which personnel and materiel are protected from enemy fire.

Cross Compartment.—Compartment of terrain the longer axis of which is oblique or perpendicular to the direction of advance.

D-day.—Day on which an attack or operation, that has previously been planned, is initiated.

Danger Space.—Space in the trajectory of bullets fired from small arms which is not higher than the height of an average man.

Debar.—To unload troops and equipment from a vessel or aircraft.

Decontaminate.—To make safe for unprotected personnel, animals, equipment, or supplies by rendering harmless or destroying harmful chemicals.

Defend.—To attempt to hold an area against enemy opposition without attempting to advance.

Defense.—Means used as protection against an attack. An active defense is carried out by counterattacking. A passive defense is carried out by attempting to merely hold the area.

Deflection.—In gunnery, the horizontal angle between the line of sight and the axis of the bore of the gun when the gun is pointed for firing.

Delaying Action.—Defensive battle used to slow the enemy's advance and to gain time without becoming closely engaged, characteristic of the actions of a rear guard in a retreat.

Demobilize.—To disband troops as at the end of a war.

Deployment.—Act of spreading out a body of troops as for combat. The extension may be made in width or depth or both.

Desertion.—Leaving a military post or duty with the intention of not returning, or of avoiding hazardous duty.

Develop.—To make more apparent, as to develop the enemy's position. To break up a body of troops into smaller groups in preparation for combat.

Dumdum Bullet.—Bullet that expands upon impact. It usually has a soft lead nose.

Dummy Installation.—False targets, as dummy artillery guns, used to deceive the enemy.

- Echelon.**—Arrangement of individuals, units, or equipment with each slightly to the right or left of the one immediately in front, like a series of stairsteps. Sub-division of a unit, as the forward echelon and rear echelon of a headquarters.
- Element.**—Smaller part of a military organization or maneuver. It may be an individual, platoon, a crew, or any unit that is part of a larger group.
- Elevation.**—In gunnery, the vertical angle between the line of sight and the axis of the bore of a gun when the gun is pointed for firing.
- Embark.**—To load troops and equipment on a vessel or aircraft.
- Embrasure.**—Opening, with sides flaring outward, in the wall of a parapet or a fortification, through which weapons are fired.
- Emplacement.**—Position prepared for weapons or equipment from which their missions may be executed. Usually there is side and overhead protection against hostile firing and bombing.
- Enfilade.**—To fire from the flank of a line so as to sweep it with fire in the direction of its length. Gunfire which sweeps a line in the direction of its length is known as enfilade fire.
- Envelopment.**—Attack made around one or both of the enemy's flanks or rear, usually coordinated with an attack on his front; enveloping attack.
- Expeditionary Force.**—Military force for invading or fighting in a foreign country.
- Field.**—Terrain over which battles are fought or maneuvers are conducted.
- Fifth Column.**—Sympathizers and supporters of the enemy secretly engaged in espionage, sabotage, and other subversive activities behind the battle lines of a military force.
- Fire Control.**—In gunnery, pertaining to the operations required to prepare the data and actually place fire on a target; conduct of fire. Ability of a commander to open fire, adjust fire upon the target, shift fire to other targets, and to cease firing as required.
- Fire Discipline.**—Obedience of personnel to the orders of a commander in delivering fire on designated targets.
- Fire Superiority.**—Fire of greater accuracy and volume than that of the enemy. Fire superiority enables troops to advance against the enemy without unduly heavy losses.
- Fixed Gun.**—Firearm mounted in an airplane or vehicle in such a manner that it cannot be aimed except by maneuvering the plane or vehicle.
- Flare.**—Very bright light, designed primarily for illumination. It may be suspended from a small parachute or be unsuspended. Flares are a form of pyrotechnic and may be fired from weapons, dropped from aircraft, or burned on the ground.
- Flash and Sound Ranging.**—Method of locating the position of an enemy gun by observing the flash and by calculations based on the time intervals between the reception of the sound at previously oriented microphone stations.
- Flexible Gun.**—Firearm mounted in such a manner that it can be swung in any direction.
- Flight Deck.**—Upper deck of an aircraft carrier designed and constructed for the landing and taking off of aircraft.
- Forced Crossing.**—Crossing of a stream made in opposition to the enemy.
- Forced Landing.**—Landing an aircraft due to bad mechanical or weather conditions. Landing troops on a shore in opposition to the enemy.
- Forced March.**—Distance march during which the rate of march is increased above normal or the time for rest is reduced below normal, in order that troops may arrive at their destination in less than the usual time.
- Foxhole.**—Small pit used for the protection of one or two men against firing or bombing. It is usually constructed so that an occupant can fire from it.
- Garrison.**—Military post at which troops are stationed. To station troops at a military post or in a fortification.
- Gas.**—Chemical agent used for casualty effect in combat. To use such as an agent.
- General Staff.**—Group of officers in a unit as large as, or larger than, a division who assist the commanding general. The general staff is usually divided into four sections: personnel, intelligence, operations and training, and supply and evacuation.
- Grade.**—Rank in the military service; applies to both officers and enlisted personnel.
- Grenade.**—Small bomb, containing explosives or chemicals, thrown by hand or fired from a weapon. The two most widely used types are hand grenades and rifle grenades.
- Guerrilla Warfare.**—Irregular operations carried on by small independent bands, usually in connection with a regular war, for the purpose of harassing the enemy.
- Guided Missile.**—Projectile in which there is contained a mechanism for changing either its speed or direction, or both, in response to signals received while in flight.
- Gunnery Officer.**—Officer in an artillery unit who is especially qualified in the practical handling of guns and the technical problems involved in firing. He supervises the preparation of all data required for effective control of the fire.
- H-hour.**—Hour at which an attack or operation, that has previously been planned, is initiated; zero hour.
- Half-track Vehicle.**—Motor vehicle steered by two front wheels and propelled by a tracklaying arrangement in the rear; half-track.
- Height of Burst.**—Vertical distance from the target to the bursting point of the projectile.
- Helmet.**—Hat made of steel and worn as protection against small arms bullets and shell and bomb fragments.
- High Explosive.**—Any explosive that burns with extreme rapidity and has a shattering effect. A high explosive is used as a bursting charge in projectiles and bombs, whereas a low explosive is used as a propelling charge in guns and for blasting.
- Holding Attack.**—Attack for the purpose of containing the enemy in one part of the field, thus preventing him from reinforcing his troops along the line of main attack; secondary attack.
- Howitzer.**—Artillery piece with a medium length barrel, designed to deliver high angle fire with shells of a medium muzzle velocity. The high angle of fire enables this weapon to hit targets that cannot be reached by flat trajectory guns.
- Incendiary.**—Any chemical agent which generates sufficient heat to ignite usually noninflammable material. The incendiary material may be contained in shells, bombs, or grenades, and be ignited at the bursting of the container.
- Indirect Fire.**—Gunfire delivered at a target that cannot be seen from the gun position. The gun is aimed by sighting at a fixed object, called the aiming point, or by using a means of pointing other than the sight.
- Inshore Patrol.**—Part of the local naval defense forces operating in the inner areas of navigable coastal waters. It consists of naval vessels and aircraft, and it controls shipping within a defensive sea area.
- Insignia.**—Distinguishing badges, bars, medals, chevrons, and other insignia, worn on the uniform to show rank, branch, service, and honors.
- Intelligence.**—Collected, evaluated, and interpreted military information concerning a possible or actual enemy or theater of operation.
- Jam.**—To introduce false signals into enemy radio or radar receiving equipment so as to distort the information that otherwise might be received.
- Jeep.**—Four wheel motor vehicles, capable of carrying ¼-ton of cargo or 3 passengers, in addition to the driver. It has great cross-country and hill-climbing ability. The jeep has many uses, such as for reconnaissance, towing small cannon and cargo trailers, and transporting stretchers.
- Jet Propulsion.**—Reaction propelling in which the propelling unit obtains oxygen from the air, as distinguished from rocket propulsion in which the unit carries its own oxygen-producing material. In aircraft propulsion, a gasoline or other fuel turbine jet unit which discharges hot gas through a tail pipe and a nozzle, causing a thrust which propels the aircraft. See article **JET PROPULSION**.
- Joint Operations.**—Military action carried out by army and naval forces acting together. Military action by two or more nations in concert is called combined operations.
- Journal.**—Daily record of principal events, messages received and dispatched, visits of superior officers, and absences of the commander from the headquarters. It is kept by a unit or staff section in the field.
- Kamikaze.**—Japanese word meaning suicide corps. Pertaining to the Japanese pilots and planes that attempted to destroy enemy ships by flying into them and exploding the planes' bomb load on impact.
- Landing Area.**—Area for the landing of all units of an airborne or amphibious force. Usually the landing area will contain several regimental or battalion parachute drop zones and glider landing zones or landing beaches.
- Launcher.**—Device for discharging rockets (bazooka) or firing grenades from a rifle or carbine.

- Liaison.**—Close contact and coordination between a commander and his subordinates and between adjacent units. It is often maintained by an exchange of personnel between the headquarters concerned.
- Loran.**—Short for long range navigation. Two sets of radio stations send out waves to a receiver on a ship. The receiver translates the radio impulses into the ship's location.
- M-1 Rifle.**—Semiautomatic, gas-operated, clip-fed, .30 caliber rifle. It is standard equipment in the army. Often referred to as the Garand rifle.
- Magazine.**—Container, holding a supply of ammunition, which can be attached to a gun. The cartridges are fed into the gun from the magazine.
- Maginot Line.**—Line of defensive fortifications built by France, after World War I, to protect her eastern frontier. Named for André Maginot, (1877-1932) French minister of war.
- Main Attack.**—Attack carried out by the larger portion of a commander's troops with the mission of securing the chief objective or key point.
- Main Line of Resistance.**—Line joining the forward edges of the principal centers of resistance. A determined effort is made to prevent the enemy from penetrating this line.
- Maneuvers.**—Tactical exercises; war games carried out in the field by large bodies of troops for instruction of military personnel and tests of matériel.
- Matériel.**—Material equipment, apparatus, and supplies used in combat.
- Mechanize.**—To provide armored motor vehicles, such as tanks, half-tracks, and self-propelled guns in which a unit travels and from which it fights.
- Meeting Engagement.**—Encounter in the field between opposing forces, neither of which is fully deployed for combat.
- Military Government.**—Government by military forces over occupied foreign territory or over domestic territory regained from insurgents.
- Mine.**—Container for explosive or chemical agents fired at will by a control device or upon contact. Mines may be submerged, laid on the ground, or buried. They are used to cause casualties among ships, vehicles, and troops.
- Morale.**—Mental attitude of military personnel with respect to army life and its associations.
- Mortar.**—Short barreled, muzzle loading artillery weapon, usually with a smooth bore. It has a shorter range and a higher angle of fire than a howitzer.
- Motorize.**—To provide motor vehicles in which a unit travels. The unit normally dismounts from the vehicles to fight.
- Muzzle Brake.**—Device on the muzzle of a gun barrel which utilizes the escaping gases to reduce the effective recoil force.
- Napalm.**—Substance for thickening gasoline to be used in flame throwers and incendiary bombs.
- Neutralize.**—Render harmless or wipe out enemy troops and equipment by the use of gunfire, bombs, or chemicals. To decontaminate a chemical agent.
- Nissen Hut.**—Quickly erected, arched, insulated shelter.
- Objective.**—Military goal, such as a place that a unit has been ordered to occupy, or an enemy force that it has been ordered to overcome.
- Offense.**—Act of attacking; assault.
- Operation.**—Military action; combination of all the details of planning and executing a phase of combat.
- Order of Battle.**—Strength, organization, and dispositions of the enemy as deduced from all available information.
- Ordnance.**—Military equipment, such as weapons, ammunition, combat and special purpose vehicles, and repair tools and machinery.
- Outpost.**—Security detachment sent out some distance by a halted command or defensive position to protect against surprise, observation, and annoyance by enemy ground forces.
- Pack Transportation.**—Animals, with the required equipment and personnel, used for carrying weapons, ammunition, and supplies on their backs. Pack transportation finds its greatest use in mountainous terrain.
- Panzer.**—German word meaning armor. When combined with nouns it means armored, as panzer division, a mechanized armored offensive force employed specially for attack in coordination with attack aviation.
- Parachute.**—Folding umbrellalike contrivance, usually of light fabric, whose resistance to the air retards the speed of a falling body. It is used to enable personnel and supplies to be dropped from an aircraft in flight without injury or damage.
- Patrol.**—Small group of troops, vehicles, aircraft, or ships assigned to provide security for, or to gain information for, a larger force.
- Pillbox.**—Low fortification, containing one or more machineguns or antitank weapons, used to strengthen a defensive line. It is usually constructed of concrete, steel, or filled sandbags.
- Pontoon Bridge.**—Temporary floating bridge for the passage of troops or vehicles, supported by boats, metal cylinders, or other buoyant objects.
- Position in Readiness.**—Location in which troops trained and equipped for battle are held ready for instant action, especially when the exact place in the battle that they will be required for has not been determined.
- Pyrotechnics.**—Fireworks signal lights used for communication. The signal may be dropped from aircraft or fired from the ground.
- Quartering.**—Assigning shelter for troops, headquarters, establishments, and supplies.
- Quartermaster Corps.**—Branch of the army responsible for providing food, clothing, shelter, and some types of equipment.
- Radar.**—Short for radio direction and ranging equipment. Electrical apparatus with which targets are detected and their ranges and directions measured. The radar transmits radio waves that are reflected by the target back to the receiving apparatus. See article RADAR.
- Radio Direction Finder.**—Aircraft instrument that receives direction signals from radio stations. The signals are registered by an indicator on an azimuth scale.
- Raid.**—Sudden attack or invasion by troops, aircraft, or naval vessels for the purpose of securing information, harassing or deceiving the enemy. Usually there is no intention of holding the territory invaded.
- Railhead (truckhead, navigationhead, or airhead).**—Point at which supplies are unloaded, and from which they are distributed or forwarded, usually by another means of transportation.
- Range.**—Distance from the gun to the target; elevation necessary to be set off on a gun to hit a certain target; operating limit, such as the range of a gun or an airplane. Also, area equipped for practice shooting at targets, called target range.
- Ration.**—Fixed daily allowance of food for one soldier. To supply with food.
- Recoilless Weapon.**—Weapon characterized by a lack of backward force and movement when fired. It differs from a rocket launcher in that the propelling charge is burned in the chamber of the weapon instead of in an attachment to, or a part of, the projectile.
- Reconnaissance.**—Examination of an area to gain military information. Reconnaissance may be made from the air, water, or ground.
- Revetment.**—Retaining wall of filled sandbags, boards, wire mesh, or brush, to prevent steep earthen slopes from caving in. Often used in fortifications.
- Ricochet.**—Glancing rebound or skipping of a projectile along a flat surface.
- Road block.**—Obstacle to prevent the movement of vehicles along a road. It is usually guarded or covered by fire to prevent its unauthorized removal.
- Rocket.**—Projectile which is self-propelled by the escape of gases from the rear of the combustion chamber. Single rockets are fired from the bazooka and other hand carried rocket launchers. Multiple rockets are fired from launchers mounted on aircraft, ships, tanks, trucks, and trailers.
- Roger.**—Word used in radiotelephone conversation meaning received. In the phonetic alphabet, it is also the letter R.
- Route of Communication.**—Network of roads, navigable waters, and airplane landing and rail facilities over which supplies are transported and combat movements made.
- Sabotage.**—Destruction of, or damage to, installations and facilities by enemy agents acting surreptitiously in an attempt to impede the progress of the war.
- Salient.**—Outwardly projecting part of a battle line or fortification. The corresponding dent in the opposing line is called a re-entrant.
- Salvage.**—Collection of property (condemned, abandoned, or captured) for reclaiming or scrapping.
- Salvo.**—Group of shots fired at the same time by a battery of artillery or a group of bombs dropped at the same time by an airplane. One round per gun, in a battery, fired in a prescribed order with a prescribed time interval between shots.
- Schutzstaffel.**—Trained unit of the Nazi Army whose personnel were highly credited members of the Nazi Party. Abbreviation SS or S.S.

Screen.—Protection from enemy ground reconnaissance or observation, and sometimes from enemy fire. A body of troops, camouflage, smoke screen, or a natural terrain feature may serve as a screen.

Sector.—Clearly defined subdivision of a defensive position which a given unit, weapon, or individual protects or covers. Sometimes only the areas held by regiments or large units are called sectors.

Security.—Measures taken to prevent the enemy from gaining information. They include the placing of troops to protect against attack and the steps taken to insure that messages are genuine and that the meaning of the codes and ciphers are not known to the enemy.

Self-propelled Gun.—Artillery piece mounted on a motor vehicle, usually on a track-laying vehicle similar to a tank.

Service.—Military or naval duty; military service. Branch of the army primarily concerned with administration, supply, transportation, or medical care. A combatant branch is called an arm.

Shaped Charge.—Explosive material molded with a cone-shaped depression so that the explosive energy is concentrated in one direction. The shaped charge has great penetrating qualities and is able to blast holes in steel and concrete.

Shock Troops.—Troops specially organized, trained, and equipped for attack and hand-to-hand combat.

Situation Map.—Map showing the tactical and/or administrative situation of a unit at any time. It also shows the known enemy situation.

Small Arms.—Firearms carried on the person and used in the hands.

Sniper.—Rifleman, often camouflaged, who fires from a concealed position at detached enemy individuals, especially those not in action.

Sniperscope.—Portable device combining infrared rays with a shoulder weapon to enable an operator to see and shoot at targets in the dark.

Snooperscope.—Portable device using infrared rays to enable an operator to see in the dark.

Spearhead.—Leading assault troops in an offensive operation. To hold the most advanced position in an attack.

Standing Operating Procedure.—Previously prescribed instructions regarding the procedures to be followed when certain normal conditions exist or situations arise. Abbreviation SOP.

Strafe.—To shell or bombard vigorously, especially to machinegun and bomb enemy ground positions from aircraft.

Strategy.—Science and art of employing the armed strength of a nation in gaining and keeping the advantage over the enemy in combat operations. Strategy involves planning on a large scale; tactics involves the operations necessary to carry out these plans.

Support.—Assistance or protection given by one element or unit to another, as artillery fire used to support infantry troops. Unit which assists another in combat.

Sweep.—To pass a mine detector over the ground to locate buried mines. To drag the water to locate submerged mines. To cover an area with gunfire. Swift flight of a group of aircraft over enemy territory. The trace produced on the screen of a radar.

Tactics.—Science and art of maneuvering troops and ships in action or in the presence of the enemy. Tactics differs from strategy which refers to the broad plan of a nation at war.

Task Force.—Temporary grouping of several units; usually several arms, such as air, infantry, artillery, armor, and engineers; under one commander to perform a certain combat mission.

Terrain.—Area of ground considered as to its natural features for use in a military operation.

Theater of Operations.—Combat area, including that portion of the adjacent districts necessary for the administration and supply pertaining to the combat operations.

Thermite.—Incendiary agent, used in projectiles, consisting of powdered aluminum and the oxide of another metal, usually iron. When ignited thermite produces hot molten metal.

Ultimatum.—Final proposition or condition offered by one nation or military force to another, carrying with it a threat of military action if the demands are not met.

Unconditional Surrender.—Act of absolutely giving up without reservations or terms.

Unit.—Military organization. A unit may vary in size from a squad of a few men up to an army of millions.

VT Fuse.—Fuze on a shell or a bomb containing a device, normally a small radio, which causes the fuze to operate when it comes within a certain distance of the ground or any object. Used against targets in the air as well as against targets on the ground and water.

War Dog.—Dog trained to perform such special tasks as guard duty, scouting, carrying messages, and searching for the wounded.

War of Masses.—Warfare in which the large number of men involved, rather than the quantity and quality of their equipment, is the deciding factor.

War of Movement.—Mobile warfare characterized by maneuver, initiative, and the seizure of key terrain features.

War of Position.—Warfare characterized by lack of movement and aimed principally at denying strategic areas to the enemy.

West Wall.—Line of defensive fortifications near the western boundary of Germany; Siegfried Line.

Window.—Metallic strips scattered in the air by aircraft, rocket, or shell for the purpose of deceiving a radar operator as to the actual number and location of aircraft in the area.

Y Gun.—Antisubmarine gun, shaped like the letter Y, and usually mounted near the stern of a vessel, which is used to throw depth charges into the water.

Zero Hour.—Hour at which an attack or operation, that has previously been planned, is initiated; H-hour.

Zone of Operations.—Ground, sea, and air area containing the routes by which an army advances from its base toward its objective.

RICHARD G. THOMAS, JR.,
Colonel, U.S. Army (Retired).

MILITARY TRANSPORTATION includes all the media employed to carry the troops, baggage, supplies, stores, and impedimenta of an army. These means may be stated in the following broad general lines: (1) Water, (2) Rail, (3) Motor, (4) Air, (5) Pipeline, (6) Animal. These individual names are sufficiently descriptive to indicate the use and place of each in the transportation scheme. Operating responsibility rests with the quartermaster general who makes commercial carrier contracts; arranges rail facilities; operates ships, barges and lighters; provides port facilities; coordinates air corps and commercial lines procedure as they meet for army service; contracts for the purchase and manufacture of motor and animal-drawn vehicles, according to definite army specifications; purchases horses and mules and operates remount stations where army animals are bred; controls existing commercial pipelines used for transporting crude and refined oil. There is provision in the National Defense Act for the quartermaster general to take over the operation of all commercial carriers in time of national emergency. See also ARMY TRANSPORT SERVICE; MILITARY RAILWAYS; SUPPLY RAILWAYS.

MILITCHEVITCH, Djakov, Milam, Serbian author and ethnologist: b. Ripany June 4, 1831; d. Belgrade, 1908. He concluded his theological education in 1850, entered the service of the state in 1852 and in 1861 he became secretary to the minister of education. He edited the periodical *Skola* in 1868-1876, in addition to his official duties; and in 1886 was appointed librarian at the National Library of Belgrade. He ranked as one of the foremost Serbian scholars of his time. He wrote *History of Pedagogy* (1871); *The Principality of Serbia* (1876); *Life of the Serbian Peasant* (1867-1877); *Lives and Works of Illustrious Men* (1867-1879); *The Kingdom of Serbia* (1884); *Biography of Famous Serbians of Modern Times* (1888).

MILITIA. By definition, this is the term applied to fighting men, citizens under normal conditions, who are compelled to hold themselves in readiness for military service, really soldiers "on call." The word itself comes from the Latin *miles*, meaning "soldier," and *militia*, meaning "military service." Among primitive

people, it was common practice for the whole citizen body to serve as soldiers. Greece, particularly in its early organization of city states, definitely joined the art of war with the art of politics, for in the reign of Pericles in Athens, the youth was recognized as a *man* citizen in the state through his partaking of military training and becoming an *armed* citizen. Under Cleisthenes, all freemen met as a body and, using their political right, voted for war; then, the same body of freemen became the military body which fought the war decided upon. Thus the militia idea became an accepted part of national thought. It was invoked against the too great grasping of monarchical power and the arrogance of eastern dynasties, and was employed to throw back invasion by mercenary troops. At Morgarten, Switzerland, in 1315, mercenary invaders suffered defeat at the hands of militia troops, since which time the Swiss have considered the militia to comprise their whole armed force.

English Militia.—The first mention of the *fyrd* occurs in the Anglo-Saxon Chronicle in the year 605. It was a local defense force, locally controlled, made up of the entire free male population, each member of which was charged with providing his own armament. By the 10th century, the *fyrd* was divided, half to fight and half to stay at home for farm work. No one was excused. Following the Norman Conquest, the *fyrd* gradually gave way to the feudal levy, founded on land and personal obligations. Warriors were weighed in terms of land, five hides to produce one fully armed fighter. However, enough of the old system was kept whereby siege warfare could be maintained with troops drawn by the general levy, thus freeing the mounted knight for his spectacular incursions on neighboring territories.

Henry II, in 1185, recognized the value of having something more than the feudal levy when he required that all burghers and freemen should be armed with a lance and should wear a mail doublet and an iron headpiece. He limited employment of troops so raised and armed to local service. As the feudal system expanded, the English kings used the general levy increasingly since it, and scattered units of hired professional soldiers, came to represent the only forces royalty could interpose to the tremendous power of the arrogant feudal barons. The Statute of Winchester (reign of Edward I) ordered that "every man have in his house harness for to keep the peace after the ancient assize"; certainly there was a definite intent here to use the militia to suppress civic disturbances. In the period from the 14th to the 16th century a practice arose of appointing outstanding persons in each county to have charge of the militia forces under royal commissions. In 1550, under Edward VI there is noted the existence of a lord lieutenant for each county whose duty it was as a military officer to raise his county's military forces in behalf of the nation. When the Spanish Armada threatened the British Isles, these lord lieutenants perfected all plans for internal defense, and it was under their administration that reliance came more and more to be placed upon the "train bands." During the reign of Charles I, when King and Parliament were at each other's throats, both sides sought to employ these forces, but with the exception

of the London "train bands," there was little accomplished by their use.

After the Restoration there was a very definite public revulsion of feeling against the professional soldier, so much so that in 1662 England hoped to do away with the professional soldier entirely and substitute therefor the militia, controlled by the Crown and financially supported by the Parliament. However, the wars with France and Holland which occupied the following hundred years, showed that the professional soldier was an absolute necessity. Regular troops came into their own and the militia was tolerated as a very minor part of the national military system. In 1757, the militia was reorganized on a selective compulsory system and was frequently used, when the French threatened invasion, until 1815. From that date until 1852, the militia was allowed to lie dormant. On this latter date it was reorganized on a purely volunteer basis. Thus, militia in England practically came to an end in 1815. In 1871, the militia, which as we have seen went on a volunteer basis in 1852, was taken from control of the county lord lieutenants and placed directly under the Crown, becoming, in effect, a second standing army. In 1907, the Territorial and Reserve Forces Act completed the abolition of the militia whose units were shifted either to the Special Reserve or to the Territorials where, as units or as individuals, they should be available to supplement the Regular Army. In the 1940 war emergency, newspaper reports and pictures emanating from rural English communities indicated a possible rebirth of the militia.

American Militia.—From a social and political system which evidenced many signs of stability in pattern, colonists came to the North American continent to experience conditions of absolute primitiveness. As they came to the New World, they perforce brought with them the only institutions they knew—British. The conditions under which they had to live forced them to roll back the curtain of time somewhat and revert to the pattern of early Anglo-Saxon times, when, as mentioned previously, the *fyrd* constituted the home defense force. There was no time for debate on the matter—an Indian arrow could and very probably would silence the most profound debater. Neither was there room for one who was only a professional soldier. Grim necessity made of every workingman a soldier. The size of the colony made but little difference.

Governor Endicott of Massachusetts, in 1631, published his instructions from England to have "all planters and servants instructed in the use of arms and to designate certain days for trainings." Virginia followed suit three years later, putting into operation a county system which closely resembled the lord lieutenant set-up familiar in England. One item of armament in Massachusetts provokes a smile, for it is difficult to see how settler-soldiers (when they were armed with the long pikes that were prescribed) could do much damage against the savages in the virgin forests.

In early American history, writers have accented the part played by the military forces of the Crown and have subordinated the militia, units of which were seriously involved in Bacon's Rebellion in Virginia (1676) and Leisler's Rebellion in New York (1689). As rela-

tions became tenuous between the colonies and the mother country, the militiaman again became a prominent factor. Events such as the Boston Tea Party and the Boston Massacre crystallized his expression of effort. He fought at Lexington and Concord, at the siege of Boston, and in following campaigns. Throughout the period of the American Revolution, 164,087 militiamen were engaged, constituting approximately 40 per cent of the total force.

When the colonists had won their independence, they had acquired through bitter experience a hatred for standing armies and professional soldiers. Accordingly, with the exception of a regiment of infantry and a battalion of artillery, the Regular Army was disbanded and a uniform militia was provided by the act of May 8, 1792 which stated: "That each and every free able-bodied white male citizen of the respective States resident therein, who is or shall be of the age of eighteen years, and under the age of forty-five years shall severally and respectively be enrolled in the militia by the captain or commanding officer of the company within whose bounds such citizen shall reside."

Western frontier troubles called for the raising and maintaining of a small regular force, and Indian uprisings in eastern and northern states dictated the necessity of having some better military protection than the militia law afforded. In the War of 1812 the militia merited no meed of praise for its service. Slowly through the 19th century the militia idea as set forth in the act of 1792 was abandoned.

The question of militia jurisdiction presents an interesting study. There was no federal militia; therefore, a concurrent jurisdiction over state militia arose. Shays' Rebellion (1787) threatened the federal arsenal at Springfield and we see the governor of a state (Massachusetts) ordering out the necessary militia to quell the uprising; harassed by the Whiskey Rebellion (1794), the President of the United States required that four state governors organize and hold in readiness the necessary militia force to handle the situation; John Adams (1799) called upon the governor of Pennsylvania for the militia force necessary to put down the Fries Rebellion; when the Civil War broke out, the federal government issued militia calls.

As the militia passed out of the picture, it was supplanted by what we call today the National Guard. The drafts of May 3, 1863 and of May 18, 1917 made no mention of drawing from existing militia bodies—they called simply for individuals. Federally and locally, enforcement of the militia law fell apart and the states swung to the organization of volunteer National Guard units. By successive acts in 1903, 1916, 1920, and 1933, the federal government recognized these state units and by imposing upon their members a dual oath, made them subject to federal orders in emergency. Until recent expansion of the Regular Army, the National Guard force outnumbered the Regulars. It is a splendid example of what a federal militia may be. Under existing provisions of the National Defense Act, the Army of the United States consists of the Regular Army, the Organized Reserves, and the National Guard. See also ARMY OF THE UNITED STATES; CONSCRIPTION; NATIONAL GUARD; UNITED STATES—United States Army.

Associate Military Historian, Army War College.

MILITIA, Naval. See NAVAL RESERVE.

MILIUM or **GRUTUM**, an old name, a skin disease caused by the retention of the secretion of the sebaceous glands, resulting in small white or yellowish-white globules the size of a pinhead or less, constituting a minute tumor. It usually forms around the eyes, on the cheeks or forehead, although it also occurs on other parts of the body. The tiny tumor lies just beneath the skin, slightly raised above its surface, and is supposed to form through the destruction of ducts through which the secretion of the sebaceous glands formerly passed. It may undergo calcification, but at no time in the process of its formation nor in its continued presence is there inflammation. In some cases it disappears in the course of the continuous change in the cuticle.

MILK may be defined as the normal secretion of the mammary glands. The milk of all mammals is similar in qualitative composition consisting mainly of water, fat, proteins, milk sugar and salts; together with other substances including the vitamins whose quantity is so small as to be scarcely measurable by direct analytical methods, but whose nutritional importance is very great. Colostrum, the fluid secreted for a short time immediately after giving birth to the young, is composed of similar substances, but differs considerably from normal milk in its quantitative composition and physiological properties. The average percentage composition of some of the more important milks is approximately as follows:

	Water	Fat	Protein	Sugar	Ash
Human milk	88.00	3.80	1.50	6.40	0.30
Cows' milk	87.00	4.00	3.35	4.90	0.75
Goats' milk	85.70	4.75	4.30	4.45	0.80
Ewes' milk	80.80	6.85	6.55	4.90	0.90
Asses' milk	89.50	1.75	2.00	6.25	0.50
Mares' milk	90.75	1.20	2.00	5.70	0.35

Human milk varies to such an extent that any attempt to state its average composition is liable to be misleading. The percentage of any constituent, and especially that of proteins, may differ widely from that given above while the milk is still entirely normal. Such differences are found not only in the milk of different women, but in that of the same woman at different periods of lactation.

The milk of any one species may vary widely in fat content, and considerably in protein content; but a few species' differences seem to be sufficiently established.

Cows' milk differs from human milk in containing less sugar and considerably more proteins and ash. The proteins are also of a somewhat different character, the casein being more easily coagulated and forming a tougher curd. Goats' and ewes' milks being rich in fats and proteins are well adapted to the manufacture of cheese and are largely used for this purpose in some parts of Europe. Asses' and mares' milks have been recommended as preferable to cows' milk for infant feeding, since they show some resemblance to human milk in the amount and nature of the proteins which they contain. In this country, however, the milk of the cow is the only one of commercial importance. Unless otherwise explained all of the statements which follow will be understood to refer to cows' milk, but many of them are true of the milk of other mammals as well.

Cows' Milk.—The constitution of cows' milk has been concisely stated by Henry D. Richmond: "It is essentially an aqueous solution of milk sugar, albumin, and certain salts, holding in suspension globules of fat and in a state of semisolution, casein together with mineral matter. Small quantities of other substances are also found." As regards its physical properties, milk is an opaque, white or yellowish fluid, somewhat heavier and more viscous than water, having a faint characteristic odor and a slightly sweetish taste. The yellowish color is due to the fat and the opacity and viscosity in part to the fat and in part to the casein and lime salts present. The specific gravity is usually between 1.029 and 1.034 at 15.5°C. (60°F.). Normal fresh milk shows toward litmus an amphoteric reaction, and reacts acid with phenolphthalein. This property is attributed to the presence of phosphates and of carbonic acid. The gases contained in cows' milk, carbonic acid with small amounts of oxygen and nitrogen, are for the most part evaporated in the usual processes of handling the milk and therefore need not be further considered here.

per cent in that of a cow having fever. Over 16 per cent of solids in the mixed milk of a herd or over 18 per cent in that of an individual is, however, comparatively rare.

Breed.—While much depends upon the individual cow, it is well known that some breeds tend to yield richer milk than others. The following figures, obtained by averaging the records of tests made at the New York and New Jersey agricultural experiment stations, serve to illustrate the variation in richness of milk yielded by different breeds:

Breed	Total solids, per cent	Fat, per cent	Solids-not-fat, per cent
Jersey	14.87	5.19	9.68
Guernsey	14.69	5.16	9.53
Shorthorn	13.38	4.05	9.33
Ayrshire	12.73	3.64	9.09
Holstein	11.96	3.43	8.53

Advance of Lactation.—After the third or fourth month the milk tends to increase in richness as lactation advances. A study of nearly 50 lactation periods of individual cows at the New York State Experiment Station yielded the following average results, the ob-

Prepared by U.S. Department of Agriculture, Bureau of Agricultural Economics
Milk cows and milk production in the United States, in percentages of the 1935-1939 average.

Proportions of Water and Solids.—The proportion of water in cows' milk varies considerably, depending upon breed, individuality, period of lactation, etc. While the average amount is about 87 per cent, the mixed milk of a herd may easily show as much as 88 or as little as 85 per cent of water corresponding respectively to 12 or 15 per cent of solids. The milk of a single healthy cow in normal condition may sometimes contain as little as 10 or as much as 18 per cent of solids, while in extreme cases even these latter limits may be passed. The writer has found 19.88 per cent of solids in the milk of a perfectly healthy cow and 27.40

per cent in that of a cow having fever. Over 16 per cent of solids in the mixed milk of a herd or over 18 per cent in that of an individual is, however, comparatively rare.

Months	Total solids, per cent	Fat, per cent	Solids-not-fat, per cent
First month	14.00	4.54	9.46
Second month	13.50	4.33	9.17
Third month	13.47	4.28	9.19
Fourth month	13.64	4.39	9.25
Fifth month	13.75	4.38	9.37
Sixth month	14.00	4.53	9.47
Seventh month	14.18	4.56	9.62
Eighth month	14.33	4.66	9.67
Ninth month	14.46	4.79	9.67
Tenth month	14.83	5.00	9.83

In the last few days of lactation, when the yield becomes very small, the proportion of

solids often rises to a marked degree, sometimes reaching 20 per cent or over.

Partial Milking.—All of the statements regarding the composition of milk refer to the product of a complete milking. In partial or fractional milking the first portions drawn are comparatively poor, especially in fat, and the last portions or "strippings" are much richer.

Milk Fats.—Milk fat, like other fats, is a mixture of glycerides (compounds of glycerin and fatty acids). It differs from other animal fats in containing a smaller proportion of stearic acid and large proportions of the acids of lower molecular weight. A detailed study of the constitution of milk fat by the late Dr. Charles A. Browne gave the following results:

Acid	Per cent of acid obtained	Corresponding per cent of glyceride
Oleic	32.50	33.95
Dioxystearic	1.00	1.04
Stearic	1.83	1.91
Palmitic	38.61	40.51
Myristic	9.89	10.44
Lauroic	2.57	2.73
Capric	0.32	0.34
Caprylic	0.49	0.53
Caproic	2.09	2.32
Butyric	5.45	6.23
Total	94.75	100.00

The last four acids are the volatile fatty acids, the large amount of which serves to distinguish milk fat (butter) from other fats which as a rule have only a fraction of a per cent of these acids. In the milk the fat exists in the form of minute suspended globules which vary considerably in size, but average about $\frac{1}{10,000}$ of an inch in diameter. A drop of average milk contains more than 100,000,000 fat globules.

Amount of Fat in Milk.—The percentage of fat in milk varies more than that of any other solid constituent or, indeed, of all the other solids combined. In the mixed milk of herds where the influence of individual cases of advanced lactation is minimized, we may consider the usual range to be from 3 to 6 per cent of fat and from 8.5 to 9.5 per cent of solids not fat. Hence the varying richness of cows' milk is due principally to differences in fat content, and as fat is also the constituent of greatest pecuniary value, a "rich" milk is essentially one containing a high percentage of fat.

Nitrogenous Compounds or Proteins of Milk.—The greater part of the nitrogen in milk (usually over three fourths) is in the form of casein, a compound protein which contains phosphorus in organic combination and is probably also combined with lime salts. Casein is readily coagulated by acids or rennet and the curd thus formed encloses the greater part of the fat which the milk contained. Of the nitrogen compounds other than casein, albumin is by far the most abundant. Milk albumin is not coagulated by rennet, nor by acids at ordinary temperatures, but is coagulated by heat. In addition to casein and albumin, milk contains small amounts of other protein bodies including the enzymes or unorganized ferments which play an important part in cheese making and probably aid the digestion when milk is consumed in the fresh state without previous heating. Among the nitrogenous compounds other than proteins which have been found in milk

may be mentioned small amounts of lecithin, amino acids, vitamins, and traces of ammonia and urea.

Amount of Proteins in Milk.—Formerly, through faulty methods of separation, the reported percentages of proteins were often very inaccurate and were usually too high. The amount of protein matter as determined by modern methods is usually between 3 and 4 per cent, being higher in those samples which are naturally richer in fat. Average milk with 13 per cent of solid matter usually contains about 4 per cent of fat and $3\frac{1}{3}$ per cent of proteins. In richer milk the increased amount of solids is usually made up of about three-fourths fat and one-fourth proteins. In other words, the percentages of fat and proteins tend to rise and fall together approximately in the proportions represented by the formula—Proteins = $2.00 + \frac{1}{3}$ Fat. Variations in fat, especially if due to temporary causes, are not always accompanied by so much variation in proteins as the formula would indicate. On the other hand, the percentage of proteins is apt to exceed that indicated by the formula, in very advanced lactation. As a rule when the amount of solids-not-fat exceeds 9 per cent, the excess is due chiefly to excess of proteins.

Milk Sugar.—Milk sugar, or lactose, has the same composition as cane sugar, but differs from the latter in some of its chemical properties and is less sweet and less readily soluble in water. The amount of sugar is rather more constant than that of proteins, being usually between 4.5 and 5.25 per cent in normal milks. While the latter figure is rarely exceeded, occasional samples may show considerably less than 4.5 per cent. In any genuine milk containing an unusually low percentage of solids-not-fat, the deficiency is apt to be principally in the milk sugar. Such milk is apt to be yielded in case of fever or unusual excitement or fatigue, and may sometimes be obtained from apparently healthy cows under normal conditions, especially during hot, dry weather.

Salts or Ash of Milk.—When milk is dried and burned there remains a white ash, the average composition of which was stated by G. F. W. Fleishmann and Max Schrodtt to be:

	Per cent
Potassium oxide	25.42
Sodium oxide	10.94
Calcium oxide	21.45
Magnesium oxide	2.54
Ferric oxide	0.11
Sulphuric anhydride	4.11
Phosphoric anhydride	24.11
Chlorine	14.60
	103.28
Less oxygen equivalent to chlorine	3.28
	100.00

A part of the phosphoric anhydride of the ash is derived from the phosphorus of the casein. The sulphuric anhydride also comes from the oxidation of the milk proteins. If these acid constituents are deducted the bases in the ash are found to be in considerable excess. In the milk these bases are combined partly with the casein and partly with citric acid, the latter being a normal constituent of milk. The amount of ash does not, therefore, exactly represent the mineral matter originally present. The ash of normal milk is usually between 0.65 and 0.80 per cent, averaging about 0.73 per cent. The ash

tends to vary with the proteins approximately in the proportion — Ash = $0.38 + 1/10$ Protein. Milk is an exceptionally rich and constant source of food calcium, together with a favorable proportion of phosphorus compounds.

Vitamins in Milk, and Its Place in the Diet.

—As Milton J. Rosenau has well emphasized, milk contains all the known vitamins. The late Dr. Lafayette B. Mendel dwelt further upon the fact that while other foods are richer sources of some individual vitamins, milk is probably unique in containing all these essentials in proportions so nearly corresponding with the nutritional needs of the human family.

Its proteins are exceptionally efficient both directly in meeting the nutritional needs of the mammalian species, and also as supplementing the proteins of the cereal grains upon which man depends so largely, for economic reasons. The emulsified form in which fat occurs in milk adds much to its digestibility; and while various food fats after being digested and absorbed serve about equally as body fuel, yet milk fat and the butter, whole milk cheese, cream and ice cream made from it are of special nutritional value because they are (as compared with most foods) relatively rich in vitamin A. There are important interrelationships between these vitamins and the functioning of some of the mineral factors in nutrition, the full discussion of which would lead us beyond the scope of this article. Hence it must suffice the present purpose to say that milk and its products have highly special significance in furnishing the mineral elements and both the fat-soluble and water-soluble vitamins in such forms and relations as give much new force to the often-stated fact that milk is the one article which nature has evolved specifically to function as food; and correspondingly it is the one food for which there is no entirely satisfactory substitute. This is true notwithstanding the fact that some individuals because of allergies or other idiosyncrasies have to get along as best they can without it; and that some whole peoples have survived under such difficult geographic and economic conditions as have limited their milk supplies very nearly to what the human mother can herself produce for her offspring. Less outstanding to the present-day viewpoint but probably of permanent importance is the fact that milk furnishes even its carbohydrate in a form especially well adapted to favorable utilization in the body.

Samuel J. Crumrine and James A. Tobey chose as the title of their book on milk, *The Most Nearly Perfect Food*; and this is probably true for the great majority of people at every stage of the life cycle. The healthy adult enjoys and profits by a varied dietary in which milk is usually more important to his nutritional well-being and resulting health and efficiency than any other one article of food.

The most recent research supports the long-current saying that "the dietary should be built around bread and milk." The breadstuffs and analogous grain products are in most countries the most acceptable of the cheaper ways of obtaining the bulk of the food calories and food protein required in nutrition, while milk is the most efficient (and in temperate regions is also the most economical) of all the "protective" foods in furnishing the type of protein which supplements the proteins of the grains, and more espe-

cially in supplying the vitamins and mineral elements which the breadstuffs and other grain products do not furnish in sufficient proportion to meet our nutritional needs. Fruits or vegetables, or both, together constitute the next most important factor in the human dietary, from the nutritional standpoint. Then, as Elmer V. McCollum and Nina Simmonds effectively pointed out, "having eaten what one should, one may for the rest eat what one likes."

With the development and diffusion of the newer knowledge of nutrition which was initiated by the scientific discoveries of the first and second decades of the 20th century and at the time of present writing is still actively showing the way to increasingly "buoyant as contrasted with merely passable health," there has been some increase in the per capita consumption of milk, fruit, and fresh vegetables. And undoubtedly we can build to still higher levels of positive health by a further shift of our food habits in the same direction; especially by taking a larger proportion of whatever quantity of food we need in the form of milk and citrus fruits.

Food Laws—Standards of Purity.—On account of the great importance of milk as food most of the states had laws regulating the sale of milk and established standards of composition for it even before the enactment of the general food laws. More attention has doubtless been given to the standard of purity for milk than for any other article of food.

Much attention has also been given to the establishment of sanitary standards and the grading of milk on the basis of sanitary qualities. The grades and standards recommended by the National Commission on Milk Standards were as follows:

GRADE A

RAW MILK.—Milk of this class shall come from cows free from disease as determined by tuberculin tests and physical examinations by a qualified veterinarian, and shall be produced and handled by employees free from disease as determined by medical inspection of a qualified physician, under sanitary conditions, such that the bacteria count shall not exceed 10,000 per cubic centimeter at the time of delivery to the consumer. It is recommended that dairies from which this supply is obtained shall score at least 80 on the United States Bureau of Animal Industry score card.

PASTEURIZED MILK.—Milk of this class shall come from cows free from disease as determined by physical examinations by a qualified veterinarian, and shall be produced and handled under sanitary conditions, such that the bacteria count at no time exceeds 200,000 per cubic centimeter. All milk of this class shall be pasteurized under official supervision, and the bacteria count shall not exceed 10,000 per cubic centimeter at the time of delivery to the consumer. It is recommended that dairies from which this supply is obtained should score 65 on the United States Bureau of Animal Industry score card.

GRADE B

Milk of this class shall come from cows free from disease as determined by physical examinations, of which one each year shall be by a qualified veterinarian, and shall be produced and handled under sanitary conditions, such that the bacteria count at no time exceeds 1,000,000 per cubic centimeter. All milk of this class shall be pasteurized under official supervision, and the bacteria count shall not exceed 50,000 per cubic centimeter when delivered to the consumer.

It is recommended that dairies producing grade B milk should be scored and that the health departments or the controlling departments, whatever they may be, strive to bring these sources up as rapidly as possible.

GRADE C

Milk of this class shall come from cows free from disease as determined by physical examinations, and shall include all milk that is produced under conditions, such

that the bacteria count is in excess of 1,000,000 per cubic centimeter.

All milk of this class shall be pasteurized, or heated to a higher temperature, and shall contain less than 50,000 bacteria per cubic centimeter when delivered to the consumer.

Whenever any large city or community finds it necessary, on account of the length of haul or other peculiar condition, to allow the sale of grade C milk, its sale shall be surrounded by safeguards such as to insure the restriction of its use to cooking and manufacturing purposes.

These grades and standards have been adopted, either directly or with such modifications as local conditions might suggest, in several of the states and cities of the United States. Merging of grades has occurred in some regions. Those interested should consult their local authorities. In general the presence of large numbers of bacteria reflects serious doubt upon the sanitary quality and even upon the wholesomeness of milk. Present opinion on this matter is perhaps best presented in the words of the following resolution adopted by the Commission on Milk Standards:

"Whereas, milk is one of the most perishable foods, being extremely susceptible to contamination and decomposition, and

"Whereas, the milk consumer is justified in demanding that milk should be clean, fresh and cold, in addition to having the element of safety, and

"Whereas, milk which is from healthy cows and is clean, fresh, and which has been kept cold, will always have a low bacterial count, and

"Whereas, milk that is dirty, stale, or has been left warm, will have a high bacterial count; therefore, it is resolved:

"First: That the health officer is justified in using the bacterial count as an indicator of the degree of care exercised by the producer and dealer in securing milk from healthy cows and in keeping the same clean, fresh and cold; and

"Second: That the health officer is justified in condemning milk with a high bacterial count as being either unhealthy or decomposed, or containing dirt, filth, or decomposed material as a result of the multiplication of bacteria due to age and temperature.

"Third: That the health officer is justified in ruling that large numbers of bacteria are a source of possible danger, and that milk containing large numbers of bacteria is to be classed as unwholesome, unless it can be shown that the bacteria present are of a harmless type, as for example, the lactic acid bacteria in buttermilk, or other especially soured milks."

Pasteurization.—Since under ordinary conditions it is not always possible to guard perfectly against the possible introduction of the germs of communicable disease into milk and since times and temperatures of heating milk, so as to ensure destruction of such pathogenic bacteria with exceedingly little, if any, injury to the milk itself, have now been thoroughly worked out, there is now practically unanimous agreement among those most interested in the subject that all milk, except that produced under extraordinarily good sanitary conditions, should be subjected to modern low temperature pasteurization before being used. In order to guard against injury to the antiscorbutic properties of the milk it should preferably be pasteurized at a temperature of only 140° to 145° Fahrenheit (60° to 63° Centigrade). Heating at this temperature for 20 to 30 minutes is the best safeguard against distribution of disease through milk; and milk thus pasteurized and protected from subsequent contamination or deterioration may be used with confidence that it has been rendered safe as regards pathogenic bacteria without serious injury to any of the normal constituents of the milk itself. Since there is a possibility that the antiscorbutic properties of milk may be injured to a slight extent

by even low temperature pasteurization, it is advisable that infants and young children fed on pasteurized milk should be given orange juice or other food of known antiscorbutic property and suited to the age of the child.

Preservation of Milk.—Milk produced under usual conditions contains large numbers of bacteria. At ordinary temperatures these multiply rapidly and soon cause such changes as to render the milk unsalable, if not unfit for use. Various preventive measures may be adopted, either to prevent bacteria from getting into the milk, to check or control their growth or to destroy them entirely. Strict cleanliness and the use of sterilized utensils exclude a large proportion of the bacteria usually present in milk and greatly improve its keeping qualities. If such milk is protected from access of air and kept cold, it will remain sweet and fresh for at least two or three weeks without any other preservative measures. (The sanitary production and handling of milk are more fully described in the article: DAIRY INDUSTRY, AMERICAN.) In this respect the American dairy practice is much in advance of that of other countries, as was strikingly shown at the exhibit of dairy products at the Paris Exposition of 1900. Three dairies engaged in city milk supply, one in New York, one in New Jersey, and one in Illinois, sent regular shipments of fresh milk and cream to Paris throughout the summer. These products were found to be sweet and sound when opened from 15 to 20 days after bottling, and it was only with great difficulty that European dairy experts could be convinced that nothing but "cleanliness and cold" had been used to preserve them. No other country except France attempted to show natural milk and cream and the French exhibits were all sour on the second or third day.

It is evident that milk may be preserved much longer than is usually necessary by the observance of cleanliness to exclude bacteria as far as possible and the maintenance of a low temperature to retard the growth of those present.

For longer preservation, both the canning (after condensation or evaporation) and the drying of milk are now practiced upon a large scale and by highly developed and well controlled techniques which appear to conserve in satisfactory degree most of the known factors of nutritional value. Readers desiring to keep abreast of current developments in this field will do well to consult the Council on Foods of the American Medical Association, 535 North Dearborn Street, Chicago.

Methods of Analysis and Detection of Adulterations.—The complete analysis of a sample of milk requires much time and elaborate apparatus and is not practicable for others than trained chemists. The tests described below are more easily performed and if carefully carried out will in many cases yield all the information required. Before taking a portion for any determination the milk to be tested should be thoroughly mixed by repeatedly pouring it from one vessel to another.

Determination of Fat.—Since fat is both the most valuable and the most variable of the solids in milk, its determination is often required. This may be accomplished by the method devised by Dr. S. M. Babcock, of the Wisconsin Agricultural Experiment Station, and popularly

known as the Babcock test. In making this test, a measured amount of milk is treated with about an equal volume of commercial concentrated sulphuric acid which dissolves the other constituents, leaving the fat free in a heavy solution from which it is separated by centrifugal force and collected in the graduated neck of the test bottle, where its volume is read off at once on the completion of the test. Complete directions are furnished with the testing outfit, which can be purchased for a few dollars from dealers in chemical apparatus or dairy supplies.

Determination of Specific Gravity and Estimation of Solids-Not-Fat.—Since the specific gravity of milk is raised by all of the other solids and lowered by the fat, it follows that after the influence of each has been determined, it should be possible to estimate from the percentage of fat and the specific gravity the percentage of solids-not-fat which the sample contains. To determine the specific gravity it is convenient to use a "Quevenne" or a "Soxhlet" lactometer, either of which is practically a hydrometer of sufficient range to cover the gravity of all ordinary milks and so graduated that the thousandths in excess of unity are represented by whole numbers on the scale. Thus a milk with a specific gravity of 1.0315 will give a lactometer reading of 31.5. The temperature should be observed at the same time with the lactometer reading and the latter corrected to 60° Fahrenheit by adding to the reading 0.1 for each degree Fahrenheit above the standard temperature of 60° Fahrenheit. One fourth of the corrected lactometer reading plus one fifth of the percentage of fat gives a fairly close approximation to the percentage of solids-not-fat. The lactometer reading may also be useful aside from the estimation of solids-not-fat. Although the addition of cream to milk would lower the gravity, yet in general the lactometer reading is a rough indication of the richness of the milk, because a high percentage of fat is usually accompanied by a high percentage of protein which raises the lactometer reading. Cases in which genuine milk shows a low gravity as the result of a high percentage of fat are not common and can usually be detected by noticing the viscosity and opacity of the milk as it runs from the bulb of the lactometer. The lactometer reading taken in connection with the appearance is therefore a useful preliminary test used by the milk inspectors of many cities.

Detection of Skimmed or Watered Milk.—The most common adulterations of milk are the removal of cream (or the addition of skimmed milk, which amounts to the same thing), and the addition of water. Milk which contains less than 3 per cent of fat has usually been partially skimmed, and milk containing less than 8.5 per cent of solids-not-fat has usually been watered. In most states there are minimum limits established by law and milk falling below the limit is considered to be adulterated. Thus in New York State milk must contain at least 3 per cent of fat and at least 11.5 per cent of total solids. As stated above, the percentage of fat varies much more than that of solids-not-fat. Skimming is therefore more difficult to detect than watering. In fact, it is usually impossible to distinguish by analysis between a genuine sample containing, say, 3.6 per cent of fat, and a sample originally containing 4.5 per cent of fat, one fifth of which has been removed. On

the other hand, the addition of 20 per cent of water would almost certainly reduce the percentage of solids-not-fat to a figure considerably below the normal minimum. Recently, too, a more delicate method for the detection of watering has been devised.

Other Adulterants.—The addition of chalk, calves' brains, etc., though frequently mentioned in the older works on food adulteration, is now almost unknown. Cane sugar or starch may sometimes be added to mask the effect of watering. The former may be detected by the rose-red color produced when about 10 cubic centimeters of milk are boiled for five minutes with one cubic centimeter of hydrochloric acid and 0.1 gram of resorcin. To detect the presence of starch, boil about 10 cubic centimeters of milk, cool it thoroughly and then add a few drops of a solution of iodine in potassium iodide. If starch is present a characteristic blue color will be produced.

Artificial Coloring Matter.—Caramel or yellow coloring matter such as is commonly used in butter may occasionally be added to milk. The detection of these is of little practical importance, since they would ordinarily be used only to mask the effects of gross skimming or watering such as would be readily detected by the methods already given.

Detection of Preservatives.—**FORMALDEHYDE (FORMALIN).**—Dilute the milk with an equal bulk of water in a test tube and carefully pour in commercial concentrated sulphuric acid, inclining the tube so that the acid and milk will not mix. If formaldehyde is present a violet ring forms at the junction of the two liquids. If pure acid is substituted for the commercial, a trace of some ferric salt should be added. **BORACIC ACID OR BORAX.**—Evaporate a portion of the milk to dryness and burn to ash. Moisten with a few drops of dilute hydrochloric acid and introduce a slip of yellow turmeric paper. This is turned reddish brown by boracic acid and the color may be changed to bluish black by treating with a solution of sodium carbonate. **CARBONATES OR BICARBONATES** if present in the milk would remain as carbonate after ignition and be shown by an effervescence when the ash was moistened with acid in the test for boracic acid just described.

HENRY CLAPP SHERMAN,

Mitchill Professor Emeritus of Chemistry, Columbia University.

MILK FEVER, a fever occurring in females at the time of lactation. In veterinary medicine, it is a curable disease occurring in dairy cattle upon parturition, not to be confused with milk sickness (q.v.).

MILK IN SYMBOLISM AND FOLKLORE. Since milk holds a primary position among the natural foods of man, it is not surprising to find that it has played a variety of roles in his religions, folk legends, and superstitions. Man's first use of milk from domesticated animals began in prehistoric times, and by the time written testimony appears, the production of milk and milk products was already a well-developed home industry, as is evidenced by Homer's description (*Odyssey* IX: 248f.) of goat milking in the cave of Polyphemus. However, in spite of its economic importance throughout the ages, milk probably owes its manifold symbolism more to the marvel of its origin and life-nourishing function than to man's dependence on it as food.

In the religion of the primitive Toda tribes of southern India, milk forms the most sacred element; the dairy is the most important tribal organization, and the gods assist in its operation. At their death rites, milk is fed to the dying, and after death the body is placed in the dairy. The Hereros of western Africa also use milk as an important element in their rites for the dead, at which it is consecrated and after which a small amount is left near the grave. Numerous milk superstitions are found among other primitive tribes: the Bahima and the Masai of East Africa believe that the cattle will die if their milk is boiled; the Zulus believe a wounded man must be purified before he may drink milk; among the Hottentots, the milk containers and the rams are touched by a pubescent girl for good luck; and the Gallas of East Africa rub their sacred trees with blood, butter, and milk to keep them from decaying.

In some ancient civilizations milk became the symbol for nourishment. In Egypt, the sky-goddess was depicted either as a full-breasted woman or a cow, and milk was the food she gave to the deified kings as they entered their celestial childhood; but it was otherwise of little importance in Egyptian mythology. In Indian Vedic literature, the earth is spoken of as a mother who pours forth milk to her worshipers (*Atharvaveda* IX: iii, 16) and ritual offerings combine both milk and honey (*Rig Veda* VIII: iv, 8); both the latter, however, were subordinate to soma, the sacred drink of the Hindus, just as the same combination seems to have been subordinate to wine in Graeco-Roman rites. How this combined use of milk and honey originated is not known; it is found in several traditions, representing either the best and purest in food, or, in its Biblical use (Exodus 3:8 and elsewhere), fertility, as the fertility of Palestine.

The early Hebrews were forbidden to boil a kid in its mother's milk (Exodus 23:19) and from this scriptural prohibition sprang complicated dietary laws regarding milk. See **JEWISH HISTORY AND SOCIETY—Religious Traditions and Customs** (Dietary Laws). Also in the Semitic tradition there is evidence that *laban*, or curdled milk, was used to drive away illness from the body and was extolled for its purity, a frequent attribute of milk. In the Persian *Avesta*, milk was known as a purifier of women who had given birth to a still-born child (*Vendidad* V: 52; VII: 67).

Graeco-Roman World.—Milk played a part in the symbolism of classical antiquity from the earliest times, perhaps even more than in later times when it was replaced by wine in religious rites. There is evidence that its use in ritual goes back to the Phrygian cult of the *Magna Mater*, and, by the time of Homer, mixtures of milk, honey, and wine were often employed in rites for the dead. In Euripides' *Orestes*, Helen instructs Hermione to "pour round Clytemnestra's tomb a mingled cup of honey, milk, and frothing wine" (115). Aeschylus describes a similar death offering in *The Persians* (1. 611), in which Atossa's libations at the tomb of Darius include milk and honey. As in other ancient civilizations, milk was usually associated with honey, and when combined, the mixture was called *melicration* (μελίκρατον) by the Greeks.

The symbolical use of milk survived a long time in Greek pastoral religions, as evidenced in a poem of the bucolic poet, Theocritus (fl. c.275 B.C.), and was also an important factor in the Greek mystery cults. Featured in the Dionysiac rites in lower Italy were the enigmatic words *ἔριφος ἐς γὰρ ἔπειτον*, found on a small gold plate of the 3d or 4th century B.C. In this rite, milk was a symbol of immortality and the medium for the baptizing or bathing of a baby goat. In the worship of Cybele in the Attis mysteries, its use is described by the Platonist Sallustius as a symbol of regeneration (*Concerning the Gods and the Universe*, ed. A. D. Nock, Cambridge 1926, p. 9). Later, milk symbolizing the first nourishment of man was included in elaborate Pythagorean cosmologies by the neoplatonists, Porphyry (*De antro nympharum*, 28) and Macrobius (*Commentarii in Somnium Scipionis*, I:12). According to the latter, "Pythagoras thinks that Pluto's empire extends from the Milky Way downward, because the souls, having fallen from there, seem already to have lost their celestial attributes. On that account, he said, milk was the first nourishment offered to the newly borne, because, by means of milk, the first motion of those souls falling into their terrestrial bodies was induced." From the number of references to the Milky Circle or Way in classical literature, it is evident that its "milky" attribute goes far back: Aristotle records various theories regarding its nature and origin (*Meteorologica* I:8) and later Ovid tells us "There is a high way easily seen when the sky is clear. 'Tis called the Milky Way, famed for its shining whiteness. By this way the gods fare to the halls and royal dwelling of the mighty Thunderer" (*Metamorphoses* I:168-172).

Like the Greeks, the Romans used milk in the rites of their pastoral worship. It played an important part in the cult of the Roman gods Rumina and Cumina, whose worshipers, according to Marcus Terentius Varro (*Rerum Rusticarum* II: 11, 4), were accustomed to offer sacrifices with milk instead of wine, and Virgil, in his 7th Eclogue (33), mentions a milk offering made to the garden god, Priapus. Milk instead of wine was used for the libation at the *ferae Latinae*, the rites to Jupiter Latiaris, which were held yearly on the Alban mount outside Rome. The Romans even had gods called *Lacturcia* or *Lacturnus* who were the special protectors of grain steeped in milk (*frumenta lactentia*). The evidence of the symbolical use of milk in Roman times is abundant, and many practices and superstitions regarding it were prevalent, as, for instance, the Roman women calling the wine libation made to

the *bona dea* milk, and their drinking a mixture of milk, crushed poppies, and honey as a philter at the festival of *Fortuna virilis*.

The Christian Era.—Several legends have been preserved regarding the milk of the Virgin Mary. A Milk Grotto in Bethlehem, originally a shrine of Ashtoreth, was supposedly the refuge of the nursing Virgin, a drop of whose milk fell to the floor, and since has been thought to promote the flow of female milk and to cure barrenness. Also according to legend, the small white limestone pebbles found around Bethlehem were miraculously formed by a drop of Mary's milk falling onto a rock. In several early Christian catacomb paintings a milk pail is depicted near the Good Shepherd carrying a lamb; these allusions to milk in this context have been interpreted as symbolic of the joys of heaven.

Milk and wine were used in the early Christian Agape ceremonies in honor of the dead, and in some early baptismal rites, a mixture of milk and honey was given to the neophyte to taste. This practice was described by Tertullian as forming a part of the baptismal ceremonies of the Christians in Africa; in the West, the ceremonial tasting of milk and honey often accompanied the baptism of infants as late as the 9th century. Officially, however, its use in baptisms was banned by the Trullan Council of 692.

With the development of Christian dogma, the use of *lactinia* (milk and milk products) was prohibited during fast days because of their fleshly origin. A Russian sect called the Molokani (milk-drinkers) were thus known because they opposed the Orthodox ban; in the West, it became customary, especially in Germany, for the church to award exemptions from this prohibition, called *Butterbriefe*, in return for some specific beneficence. From such revenues a steeple of the Rouen cathedral, formerly known as the Butter Tower, was financed.

Proverbs and sayings regarding milk in modern times are too numerous to mention. Some of them are rooted in superstition and others are derived from ancient symbols and associations. An example of a modern holdover of ancient symbolism is found in the German wine, *Liebfraumilch*, which comes from the vineyards surrounding the *Liebfrauenkirche* (Church of Our Beloved Lady) outside of Worms.

HOWARD ISHAM,

Editorial Staff—*The Encyclopedia Americana*.

MILK SICKNESS (also TREMBLES). This disease, which is a poisoning and commonly called milk sickness in man and trembles in livestock, was formerly attributed to a bacillus organism. However, the cause has been definitely established as a toxic substance called tremetol, which is found in the white snakeroot (*Eupatorium urticaefolium*) and rayless goldenrod or jimmyweed (*Aplopappus heterophyllus*). The livestock contract the disease by eating the plants and in turn cause the condition to occur in humans through milk and milk products. The disease occurs at the same time the animals are in pasture, usually the latter part of the summer and the beginning of autumn. Clinical signs of this condition are head-

ache, loss of appetite, fatigue, nausea, excessive thirst, constipation, and foul breath. While the prognosis is generally favorable, death may occur in a few days preceded by convulsions, then coma. The duration of the disease in man and lower animals is from a few days to several weeks.

Affected animals should be isolated and treated. No milk or milk product should be used from these affected animals, either for human or animal use. Treatment consists of saline laxatives, parenteral solutions of physiological salt solution, and glucose and sodium thiosulfate.

MILK SNAKE, the name given to a group of snakes (*Lampropeltis triangulum*) deriving their name from the unproven belief that they drink the milk of cows in pasture. Of moderate size, they are covered with reddish-brown, black-edged blotches on the body and tail, whose ground color is grey or light brown above and white with black spots underneath. The milk snake feeds on rodents, birds, and slugs, is nonpoisonous, and is found throughout the eastern United States and southeastern Canada. It is also known as house snake, spotted adder, or checkered adder.

MILK TREE, any of various tropical trees yielding a milky, wholesome sap. See COW-TREE.

MILKWEED. See ASCLEPIAS.

MILKWORT, the common name for plants of the genus *Polygala* (q.v.), widely distributed in the temperate and tropical zones.

MILKY WAY, The, or THE GALAXY (from Greek *galaktos*, milk), a nebulous band of faint stars, extending entirely around the celestial sphere. This band of luminosity is the result of an edge-on view from the Earth through a disk-shaped aggregation of stars (Galactic System) in which the Earth and Sun occupy a position near the center. The greater concentration of stars seen looking outward through the flat portion of the disk accounts for the diffuse belt of luminosity in this plane. Since the Milky Way is inclined 62° to the celestial equator, its appearance is variable with the seasons, the time of night, and the observer's latitude. Its brightest portions are in Cygnus, Aquila, Scorpius, and Sagittarius, where many bright star clouds exist. The apparent width of the Milky Way is irregular and its length is interrupted by rifts and superimposed dark nebulae, such as the northern and southern Coal Sacks. An imaginary line passing roughly central along the Milky Way and projected on the celestial sphere forms the galactic circle, from which galactic latitude is reckoned. See also STARS—*The Milky Way*.

MILL, mil, Hugh Robert, Scottish geographer: b. Thurso, Caithness, Scotland, May 28, 1861; d. East Grinstead, near London, England, April 5, 1950. Educated at the University of Edinburgh, he became physicist and chemist to the Scottish Marine Station in 1884 and, three years later, a University Extension lecturer. He served on several study boards and associations, including the British Rainfall Association, of which he was the director from 1901 until it was taken over by the Meteorological Office. He also edited *British Rainfall* and *Symons's Meteorological Magazine* and wrote *The Realm of Nature* (1892); *The Clyde Sea Area* (1895); *The Siege of the South*

Pole' (1905); 'Historical Introduction' to Sir Ernest Shackleton's 'Heart of the Antarctic' (1909). He also edited the 'Report of the Sixth International Geographical Congress' (1896), and 'The International Geography' (new ed., 1911); 'The Life of Sir Ernest Shackleton' (1923).

MILL, James, British economist, historian and utilitarian philosopher: b. Northwater Bridge, Forfarshire, Scotland, 6 April 1773; d. Kensington, 23 June 1836. His father was a cobbler, his mother a farmer's daughter and his early abilities were so marked that great care was taken with his education, so that in 1790 he entered Edinburgh University. There he was carried away with Dugald Stewart's philosophy until he came to know Bentham's system, which he then adopted. But in the university he was better known as a remarkable Greek scholar than as a philosopher. In 1802 he went to London, where he was from 1803 to 1806 editor of the *Literary Journal* and then began the 'History of India,' which occupied him 10 years. During this time he wrote much for periodicals and came to know Bentham personally; at the same time he was busied with the painstaking education of his children, notably John Stuart Mill (q.v.). The 'History of India,' a wonderfully scholarly and unpartisan work, marred only by his lack of personal knowledge of country and people and a consequent theorizing at times, was published in 1818 and immediately won for him a place in the India Office and relief from his long battle with penury. This position was the more flattering a tribute since he was now well known as a radical and a skeptic. He rose rapidly, becoming head of the office in 1830. The *Westminster Review* founded in 1824 as the organ of Bentham's followers contained many contributions by Mill; and several appeared in the *London Review*. Both in ethics, where his position was strongly utilitarian, and in political economy, where he may still be reckoned as typical of the orthodox school so bitterly attacked by Ruskin, Mill is little more than a follower of Bentham, with greater force, perhaps, because of his comparatively larger knowledge of the world. In psychology, however, although largely a follower of Hartley, his work is more important, for he developed and gave to Hartley's principle of association a wider application, and thus was the founder of the school to which Spencer and Bain belong. Mill took part in politics and contributed largely to the success of the Reform Bill by introducing to England philosophical radicalism. His personal character was strangely unhuman and unlovable, though perfectly correct. His important works besides the 'History of India' are 'Elements of Political Economy,' the first great philosophic treatise on the subject (1821), and 'Analysis of the Phenomena of the Human Mind' (1829). Consult Bain's biography (1882) and J. S. Mill's 'Autobiography' (1867).

MILL, John Stuart, English social and political reformer, philosopher, economist: b. London, 20 May 1806; d. Avignon, 8 May 1873. Few have combined so intimately a vital enthusiasm for human progress, with a keenly critical and most scholarly temper. He presents in all his most important lines of work the interesting conflict which results when a candid,

open mind, instinct with human interest, attempts to work with narrow conceptions and an inadequate method. The conceptions and method have in many respects been superseded, but the candor and sincerity, the scholarly, investigative temper, the deep interest in all things human, the democratic sympathy which manifest themselves in his works, give them permanent value.

Mill was the oldest son of James and Harriet (Burrow) Mill. His early education, conducted by his father, was extraordinary. He began Greek when about three years old, and Latin at seven, and read a great amount in both languages, especially in Greek, before he was 12. He studied algebra, geometry and the differential calculus also in this period. His history he read of his own accord and found amusement in books on natural science. At 12 Aristotle's 'Logic' began a more advanced course of instruction which included the more difficult classical authors, and ended, so far as his father's personal instruction was concerned, in his 14th year with a thorough study of Ricardo's 'Political Economy.' Mill himself says that it "was not an education of cram." "Anything which could be found out by thinking I never was told, until I had exhausted my efforts to find it out for myself." At the same time he declares that it "was in itself much more fitted for training me to *know* than to *do*." After a year in France, which had an important influence, the reading of Bentham made an epoch in his life. "I now had opinions; a creed, a doctrine, a philosophy; in one among the best senses of the word, a religion; the inculcation and diffusion of which could be made the principal outward purpose of a life." In the winter of 1822-23 he planned a society to which he gave the name of "Utilitarian," and thus brought the term into common use. In May 1823 he received an appointment from the East India Company as clerk in the office of the examiner of India correspondence. Here he remained 35 years, rising to be examiner two years before the transfer of India to the British government in 1858, when he retired upon a pension of £1,500. He became a frequent contributor to the *Westminster Review* founded in 1823 as a Radical organ, and in 1834 became editor of a new Radical review, the *London Review* (afterward the *London and Westminster*). He was one of an ardent party of "philosophic radicals"; his object in life "to be a reformer of the world." Bentham, Malthus and Ricardo were influential upon the group. But several new influences now began to unsettle his political and social views. Coleridge, especially through Maurice and Mill's intimate friend Sterling, Carlyle, Goethe, Wordsworth, and the Saint Simonians, gave broader views of human interests, and greater importance to feeling and sentiment than James Mill and Bentham. In Mill's own judgment, however, the most important influence, especially in leading "him to apply his abstract principles to the actual state of society and estimate their bearing upon human interests and sympathies more clearly and widely than he would otherwise have done," was that of Mrs. Taylor, to whom he was first introduced in 1830. He maintained with her for 20 years a friendship of increasing intimacy, and after the death of her husband

married her in 1851. Mill loved his wife tenderly and spoke of her, notably in the *Autobiography*, and in the dedication of the volume *On Liberty* which was a joint production, in terms which seemed extravagant to his friends. A third period of Mill's mental progress fell at about the time between the first and third editions of his *Political Economy* (1848-52). In the earlier period, he writes in his *Autobiography*, "I was a Democrat, but not the least of a Socialist. We were now much less democrats than I had been, because so long as education continues to be so wretchedly imperfect, we dreaded the ignorance and especially the selfishness and brutality of the mass; but our ideal of ultimate improvement went far beyond Democracy, and would class us decidedly under the general designation of Socialists." In 1858 his wife died of congestion of the lungs in Avignon. When the Civil War in America broke out he contributed a strong article on the side of the North. In 1865 he was elected a member of Parliament from Westminster, and took an active part in support of various reform measures, but was defeated for re-election in 1868. His later years were spent in literary labors until his death, which occurred at Avignon. He had then come to be generally regarded as the foremost living philosopher and economist of England.

Mill's published works are the following: *System of Logic* (1843); *Essays on some unsettled questions of Political Economy* (1844); *Principles of Political Economy* (1848); *Memorandum of the Improvements in the Administration of India* (1858); *On Liberty* (1859); *Thoughts on Parliamentary Reform* (1859); *Dissertations and Discussions* (1859-75); *Considerations on Representative Government* (1861); *Utilitarianism* (1863); *Examination of Sir William Hamilton's Philosophy* (1865); *Auguste Comte and Positivism* (1865); *England and Ireland* (1868); *Subjection of Women* (1869); *Autobiography* (1873); *Nature, the Utility of Religion and Theism* (1874). In addition may be mentioned his edition, with notes, of James Mill's *Analysis of the Phenomena of the Human Mind* (1869); his *Inaugural Address delivered to the University of Saint Andrew's* (Feb. 1, 1867); *Speech in Favor of Women's Suffrage*, Jan. 12, 1871 (1873); *Speech on the Admission of Women to the Electoral Franchise*, May 20, 1867 (1867); H. D. Pym's *Memories of Old Friends*, which contains 14 letters from J. S. Mill (1882); several articles in the *Westminster Review* and the *London and Westminster Review*, not reprinted in the *Dissertations and Discussions*.

The keynote to Mill's method is found in the individualism which he inherited from the 18th century. This meant associationalism in logic and psychology, a metaphysical conception of reality as made up of separate phenomena, an ethical theory that made pleasure and pain the motives of action, *laissez-faire* in political economy, and the political doctrine that the end of government is to protect each individual in the possession of the produce of his labor. But in all these various fields he passed the bounds set by his inheritance. He was more concerned to find truth than to maintain a creed.

As *Logician*, Mill's greatest contribution was

his treatment of induction. The four "methods" of agreement, difference, residues and concomitant variation had been mentioned by J. Herschel, but were by Mill first brought out clearly. In the part of his *Logic* which deals with the nature and conditions of knowledge he attempts, with only partial success, to give logic a more vital relation to truth and fact than it had borne since Hobbes and Locke. He insists that propositions concern "things" not "ideas"; that there are "real kinds," not merely class names; that cause is not to be defined with Hume as "invariable antecedent" but as "unconditional antecedent" or "sum of conditions." But he does not see that this really implies a reconstructed view of nature, in which a conception of an interrelated system or whole should replace the conception of a mere sum of individuals or particulars. He remains true to his older presuppositions in holding that reasoning is from particular to particular, and that axioms owe their force to association. Matter, he holds, following Berkeley, is only permanent possibilities of sensation. In his view of the self, on the one hand, he considers that we can know only states of consciousness, that the law of association is the "governing principle," and that the conceptions by which knowledge is organized are impressed upon the mind from without; on the other hand he recognizes "the paradox, that something which, *ex hypothesi*, is but a series of feelings, can be aware of itself as a series." He therefore admits that "the mind, or ego, is something different from any series of feelings or possibilities of them." While, then, he holds to the doctrine of "circumstances" as determining character, he is careful to insist that this is not "necessity" in the ordinary sense; "our own desires can do much to shape those circumstances."

As *Economist*, Mill attempted to follow the general plan of Adam Smith and give the science a more concrete form than it had received at the hands of Ricardo; to treat it not merely as an abstract science of the "economic man," but as "branch of social philosophy, so interlinked with all the other branches that its conclusions are only true conditionally." The current economist had aroused the antagonism of the working classes. Malthusianism held out a grim prospect of increasing stress with increase of population. Ricardo's presentation of the laws of wages seemed to condemn as absolutely futile all effort to raise wages, whether by voluntary association or by political action. The repeal of the corn laws would, it was feared, ultimately benefit the employers instead of the employed. Mill retained the Malthusian doctrine as one of his cornerstones. He sees hope for the laboring classes only if they will restrict their offspring and thus diminish the supply of labor. He retains also the doctrine that labor is supported by capital, and in his *Political Economy* speaks of a "wage fund." But as an ardent sympathizer with the working class Mill makes various concessions and suggestions which made his work far less a "dismal science." *Political Economy* "has no pretension to the character of a practical guide, apart from other classes of consideration." While the laws of the production of wealth are real "laws of nature," the modes of its distribution, "subject to certain conditions, depend on human will."

The "existing arrangements of society" have much to do with determining what shares fall to laborers, capitalists and landlords, and these arrangements may be altered "by the progress of social improvement." At first he thought only of getting rid of primogeniture and entails, and of promoting restraint of population by general education. He later came to look for a great advance in co-operation, and in the character which this implies. In 1869 he definitely retracted the "wage-fund doctrine, recognizing that there is a considerable range in the wage which economic conditions allow and hence that trades-unions may raise wages to a certain extent." In his last years he was especially impressed with the injustice of the places which the landowners occupy at "Malthus's feast." "Land alone has the privilege of steadily rising in value from natural causes." The "unearned increment" should be not for the private owner but for the nation. He differed from more complete Socialists in retaining competition in his scheme, and insisting that the associations for co-operation must be voluntary. He regarded the problem of the future to be "how to unite the greatest individual liberty of action, with a common ownership in the raw material of the globe, and an equal participation of all in the benefits of combined labor."

His moral and political theories are set forth in his 'Utilitarianism,' 'Liberty' and 'Subjection of Women.' He always remained a Utilitarian in the sense that he believed "those actions right which promote the greatest happiness of the greatest number"; further, he attempted to prove this by the individualistic doctrine that since each one desires his own happiness, the general happiness must be a good, not noticing the possible conflict between such happiness-seeking in individuals, which would make a "sum" impossible. But elsewhere he breaks away decisively from Bentham's doctrine that happiness means only pleasure of varying intensity, length, certainty, etc., regardless of what objects produce it. "Higher pleasure," a "sense of dignity," will not be exchanged for any amount of the "lower" by the expert judge. It is "better to be Socrates dissatisfied than a pig satisfied." This is evidently abandoning pleasure pure and simple as standard, and setting up instead a "standard for pleasure," namely, the character of the man who judges. In the 'Liberty' he states that the utility which is the ultimate appeal "must be utility in the largest sense, grounded on the permanent interests of man as a progressive being." The motives on which he relies are not the external "sanctions" of Bentham; nor yet the association of private with public happiness which James Mill had regarded as the structure of conscience. These suddenly appeared to him artificial. Partly under the influence of Comte he came to hold, rather, that conscientious regard for others is supported by natural social instincts. His 'Liberty,' the most carefully written of his works, contains a fresh and vigorous argument for the principle that only self-protection — to prevent harm to others — justifies society in interfering with the individual's liberty of action. "His own good is not a sufficient warrant." The positive reason for this is the great value of individuality in human welfare. The prin-

ciple requires not only liberty from legal restraint, but from the coercion of public opinion. It comprises, first, liberty of thought and discussion, in order that truth may be reached; secondly, liberty of tastes and pursuits; thirdly, freedom to unite for any purpose, not involving harm to others. In the 'Subjection of Women' he argues for the complete legal equality of men and women, not only to remove injustice but because "the only school of genuine moral sentiment is society between equals." "We have had the morality of submission, and the morality of chivalry and generosity; the time is now come for the morality of justice." Moreover, a position of equality with its accompanying effects of enlarged interests, wider responsibility, greater dignity and the possibility of individual development and satisfactions would add immeasurably to the well being of all other members of the family.

Mill's religious views are found chiefly in the 'Examination of Sir William Hamilton' and in the three essays published after his death. He found no warrant for making nature a standard of morals or for inferring from it perfect benevolence or justice. Indeed only by sacrificing the attribute of omnipotence can we reconcile nature with the existence of a moral deity. In all this he is considering the older deistic conceptions, nature, man and God, as three separate beings. But there is much in his thought which is incompatible with such mechanical separation of nature and spirit, and of human and divine, notably in the famous passage from the 'Examination.' In reply to Dean Mansel's mode of reconciling supposed divine action with human conceptions of justice by the doctrine that God is Inconceivable, and therefore what is wrong by human standards may be right by divine standards, Mill replies, "I will call no being good, who is not what I mean when I apply that epithet to my fellow creatures; and if such a being can sentence me to hell for not so calling him, to hell I will go." See MILL, JOHN STUART, AUTOBIOGRAPHY; ON LIBERTY.

JAMES H. TUFTS,
Professor Emeritus, University of Chicago.

MILL, the general name of a machine for grinding, crushing, or pulverizing. It also designates any of various machines which produce a manufactured product by the continuous repetition of some simple action, as a sawmill; and is used to refer to the building or buildings in which certain processes of manufacturing are carried on, such as a cotton mill or powder mill.

MILL, JOHN STUART, AUTOBIOGRAPHY. This has been called the history of an education, showing what may be accomplished in forming a boy's mind both for good and ill. Mill's teacher was his father, whose ardor in the task was stimulated by the facility of his pupil. He began Greek at three; Latin at seven; by 12 he knew most of the best in both languages, besides reading in English "chiefly histories," and composing one book in continuation of Pope's *Iliad*. At 12 he began logic; at 13, political economy; at 17 he was writing articles for the *Westminster Review*. But such forcing of the faculties must be paid for. It was impossible that Mill's education should not produce a distinguished mind, it was equally impossible that it should produce a joyous one. His boyhood lacked games and youthful companionship. At 20, a not unnatural reaction caused a sudden collapse in his whole intellectual outlook, resulting in profound depression, when this brilliant boy "seemed to have nothing left to live for."

From this state of "dry, heavy dejection," Mill was roused by the discovery of beauty, art, music and poetry, all of which had been omitted from the system of the elder Mill. Thus he came to perceive the value of feeling and emotion, and was brought back to hope and enjoyment by pleasure in Wordsworth's poetry and the *Memoirs of Marmontel*. Admirable as all this is, not less so is his account of "that friendship which has been the honor and chief blessing of my existence," his marriage with Mrs. Taylor in 1851. Mill's intellectual isolation made the experience a vital one; and the words in which he draws his wife's character and their companionship in work and thought are among the most impressive of their kind.

Much of the *Autobiography* is taken up with an account of the genesis and growth of Mill's chief works and with a discussion of his father's character and opinions and of the philosophy of Sir William Hamilton and of Auguste Comte. But the book, while primarily intellectual, is not without humanity and warmth, even apart from the glowing passages devoted to the author's wife. Mill's friends, Austin, Maurice, Sterling, the Carlyles and others, come into the human picture as well. The style is admirable for the purpose, clear, dispassionate and not unduly restrained; and the attitude of sane analysis, of modesty and of thoughtful discrimination has never been surpassed in any autobiography. The world has taken the earlier portion of the book—the story of the growth of the boy's mind and character—as its unique contribution to the literature of autobiography; but scarcely less valuable are Mill's pictures of his contemporaries and his analysis of the thought and the social movements of his time.

ANNA ROBESON BURR.

MILL ON THE FLOSS, *The*. This novel, by George Eliot (Mrs. Marianne Evans Cross), published in 1860, was the second of the long

novels of the author, being preceded by *Adam Bede*. It was favorably received on publication and the opening parts, particularly those dealing with the childhood of Tom and Maggie Tulliver, are commonly regarded as among the best work that George Eliot ever did, but the last of the three volumes as originally published was regarded less favorably, largely because of some artificiality of episode and treatment.

In many respects *The Mill on the Floss* is the most personal of the author's stories. In depicting the heroine she drew to some extent from her own experience, and many of the characters in the book are drawn from people in her own family. The central idea is characteristic of the writing of the author. It is the hopelessness of the attempt of a person of given temperament to accommodate herself to unsympathetic conditions. Maggie Tulliver, a young woman of unusual sensibility and always seeking for happiness, grows up among plain, hard, matter-of-fact people and narrow surroundings. Her volatile temperament causes numerous misunderstandings with her robust and sturdy young brother, Tom, as notably in her forgetting to feed his rabbits during his absence. His partisanship in the feud that had wrecked the fortunes of the Tulliver family and brought about the ruin and death of his father thwarts Maggie's growing love affair with Philip Wakem and later on condemns her for her lack of fairness and firmness in the somewhat artificial episode of Stephen Guest. Meanwhile she has sought consolation in reading *The Imitation of Christ*, but this, like her family and friends and her affectionate nature, proves a fragile reed. The author, apparently despairing of any possible outcome under such conditions for the happiness of Maggie Tulliver or for her finding even a satisfactory place in the world, drowns her along with her newly-reconciled brother in a somewhat supererogatory inundation.

The desire of the author was apparently to push the temperament to an inevitable conclusion, but the real problem was to account for Maggie had she remained normally alive. The factitious elements which have been spoken of are out of keeping with the general tendency of George Eliot's work, which is to analyze and account for the development of character under less accidental conditions of life.

WILLIAM T. BREWSTER.

MILL SPRINGS, village, Kentucky, in Wayne County, 15 miles southwest of Somerset on the Cumberland River and State Highway 90, altitude 844 feet. It has steamer connections with places on the Cumberland and the Ohio Rivers. Notable chiefly as the site of the Civil War engagement fought here in 1862 (see **MILL SPRINGS, BATTLE OF**), it has a postoffice, a National Cemetery, a water-power grist mill (1818) with an overshot wheel 31 feet in diameter, said to be the second largest in the world, and Lanier House, the headquarters of the Confederate Gen. Felix Zollicoffer before the historic battle. Lake Cumberland was formed near the village by the construction of a dam on Wolf Creek. Pop. (1952 est.) 200.

MILL SPRINGS, Battle of. In the American Civil War, the opening of the Kentucky-Tennessee campaign of 1862, also known as the battle of Fishing Creek and of Logan Cross

Roads. It was the first important Union victory in the west.

At the close of 1861 the Confederate line extended from Columbus, Ky., on the Mississippi, through Fort Henry on the Tennessee, Fort Donelson on the Cumberland, Clarksville, Tenn., and Bowling Green, Ky., to Mill Springs on the Cumberland. Gen. Albert Sidney Johnston was in chief command. Gen. Dan Carlos Buell was the opposing Union commander. Gen. Felix K. Zollicoffer established the Confederate right at Mill Springs early in December. Gen. George B. Crittenden took general command there at the middle of the month, with the brigades of Zollicoffer and W. H. Carroll under him. Gen. Leonidas Polk held the Confederate left at Columbus. Gen. J. B. Floyd reached Fort Donelson on February 13, and had under him Generals Pillow, Buckner and Bushrod Johnson. Gen. A. S. Johnston was at Bowling Green, the center, Gen. George H. Thomas was on the Union left, with Gen. Albin F. Schoepf immediately opposed to Zollicoffer, while General Buell, with headquarters at Louisville, was in close communication with the Union center, which threatened Bowling Green and Nashville.

Gen. Zollicoffer having crossed from Mill Springs to the north bank of the Cumberland from which he threatened central Kentucky, General Thomas was sent against his forces, now commanded by General Crittenden, from the direction of Lebanon. On January 18 General Thomas reached Logan's Cross Roads about 10 miles from Crittenden's entrenchments. The latter officer, with the purpose of attacking before Thomas could concentrate his forces, marched at midnight of the 18th with Zollicoffer's and Carroll's brigades, consisting of eight regiments of infantry, six guns and four battalions of cavalry, and attacked General Thomas soon after daylight of February 19.

The Union troops, consisting of six infantry regiments, one battery and a portion of a cavalry regiment, were brought rapidly into action, both sides fighting with spirit. Finally, when three fresh Union regiments fell on the Confederate right, and the 2d Minnesota was pouring a galling fire upon the center, the 9th Ohio (German Turners) made a brilliant bayonet charge completely turning the Confederate left, resulting in the Confederate lines breaking and retiring in confusion. At this point General Schoepf's brigade from Somerset reached the field, and the whole force continued in pursuit, reaching the Confederate entrenchments during the night, and forming to assault them at daylight. During the night the Confederates succeeded in crossing their men, leaving artillery, cavalry, horses, mules, wagons, camp equipage, and private baggage. The Confederate right wing was effectually broken and largely dispersed.

MILL VALLEY, town, California, in Marin County, eight miles north of San Francisco on a branch of the Northwestern Pacific Railroad providing freight service only. Altitude 57 feet. It is a residential suburb of San Francisco located at the foot of Mount Tamalpais. Nearby is the Muir Woods National Monument.

In 1834 John Reed (Reid or Read) built a sawmill here, whence the place became locally known as Mill Valley. On a map of 1873, the site was designated as Read. The town was not established, however, until the Tamalpais Land

and Water Company acquired the land and built a branch of the North Pacific Coast Railroad to it. The community was incorporated in 1900 and has a council-manager form of government. Pop. (1950) 7,331.

MILLAIS, mī-lā', Sir John Everett, English painter: b. Southampton, England, June 8, 1829; d. London, Aug. 13, 1896. His earliest years were spent in Jersey and at Dinan in France, and at the age of nine he was sent to study art under Henry Sass in London. In 1840 he became a student in the Royal Academy, and in 1846 he exhibited his *Pizarro seizing the Inca of Peru*. Next year the gold medal of the Academy was awarded to his *Young Men of Benjamin seizing their Brides*.

In 1848, along with Holman Hunt, Dante G. Rossetti, and others, Millais founded the Pre-Raphaelite Brotherhood. Among the chief works of this period are *A Huguenot*, *The Order of Release* and the *Proscribed Royalist*. In 1853 he was elected an associate of the Royal Academy, and 10 years later Academician. For a few years thereafter his pictures were still influenced by the Pre-Raphaelite principles, which he gradually abandoned. He developed into a splendid colorist, a master of technique and altogether a great modern master.

Numerous honors fell to him; he was decorated with the Legion of Honor in 1878, elected a member of the Académie des Beaux-Arts in 1882, created a baronet in 1885 and elected to succeed Lord Leighton as president of the Royal Academy in 1896; but he only held this last position about six months, dying in August of the same year. He was most successful in figure pieces and portraits, but he also produced a certain number of landscapes, one of the finest being *Chill October* (1871). He painted portraits of some of the foremost men of the day, including Mr. Gladstone, Lord Beaconsfield, Lord Salisbury, Mr. Ruskin, Lord Tennyson and others.

His son, JOHN GUILLE MILLAIS (1865-1931) was an artist and author who traveled extensively in Africa, Norway, Iceland, and the North American continent. He was known for his collection of birds, mostly of the British Isles, and his illustrations of books on sporting and natural history.

MILLAR, mīl'ēr, Andrew, British publisher: b. Scotland, 1707; d. London, June 8, 1768. He established his shop in London in 1729 and soon carried on a flourishing business. Among the books published by his firm were *Sophonisba* (1729), *Spring* (1729), and the *Seasons* (1738) by James Thomson; and *Joseph Andrews* (1742), *Tom Jones* (1749), and *Amelia* (1751) by Henry Fielding. He also published the historical works of David Hume and William Robertson. His most notable undertaking, however, was the *Dictionary* of Dr. Samuel Johnson, who cherished a high opinion of his publisher.

In 1765 Thomas Cadell became Millar's partner and two years later took over the business, when Millar retired to Kew Green.

MILLARDET, mē-yār-dē', Alexis, French botanist: b. Montmirey-la-ville (department of Jura), Dec. 13, 1838; d. Bordeaux, Dec. 15, 1902. He taught botany at the universities in Nancy, Strasbourg, and Bordeaux, and is noted for his plan of hybridization of French and American grapevines. He also worked out a treatment for

grapevines against mildew by using copper compounds. Among his writings are *Le Prothalle Mêle des Cryptogames Vasculaires* (1869) and *La Question des Vignes Américaines au Point de Vue Théorique et Pratique* (1877).

MILLAU, mē-yō', (also MILHAU; the ancient AEMILIANUM, ē-mil-i-ā'nūm), town, France, in the department of Aveyron, 30 miles southeast of Rodez, at the confluence of the Tarn and Dourbie rivers. It is a glove manufacturing center with industries including tanneries, furniture, and woolen textiles. Roquefort cheese is also marketed. The seat of a viscounty in the middle ages, Millau has a Romanesque church of Notre Dame, restored in the 16th century and a modern church of St. Francois. Pop. (1946) 15,891.

MILLAY, mī-lā', Edna St. Vincent, American poet and writer: b. Rockland, Me., Feb. 22, 1892; d. Austerlitz, N. Y., Oct. 19, 1950. One of the most popular poets America has produced, Miss Millay gained her reputation by voicing the spirit of rebellion and emancipation of the 1920's, and throughout her life her poetry, while in some respects conventional, reflected an individual and genuinely poetic talent.

She began writing verses in her childhood and her first poem to be published was "Renascence," which appeared in *The Lyric Year* for 1912. Graduating from Vassar in 1917, she published her first volume of poems in the same year. After several years of bohemian living in Greenwich Village, New York City, where she wrote short stories under the name of Nancy Boyd, Miss Millay married Eugen Jan Boissevain, with whom she moved to a farm in upper New York, and in 1923 received the Pulitzer Prize for her poem *The Harp Weaver*.

In later years her poetry revealed an increasing social consciousness. Besides her lyric and satiric verse, her works included verse plays such as *The King's Henchman*, made into an opera by Deems Taylor (1927), and a translation, with George Dillon, of Baudelaire's *Flowers of Evil* (1936). She was a member of the American Academy of Arts and Letters and in 1943 the Poetry Society of America awarded her a medal for her contribution to the humanities. First editions of her volumes of poems have commanded high prices and become collectors items. Among her many published works are *Figs from Thistles* (1920); *Second April* (1921); *The Harp Weaver and Other Poems* (1923); *Wine from These Grapes* (1934); *Conversation at Midnight* (1937); *There Are No Islands Any More* (1940); *Collected Sonnets* (1941); *The Murder of Lidice* (1942); and *Collected Lyrics* (1943).

MILLBRAE, mīl'brā, city, California, in San Mateo County, 13 miles south of San Francisco on U.S. Highway 101 and the Southern Pacific Railroad; altitude 18 feet. Chiefly a residential community, Millbrae has only local industries, including dairies and wholesale flower growing.

In 1850 an American by the name of Perry Jones settled in this area, which was originally part of Rancho Buri Buri, granted by Mexico to Jose Sanchez. A large part of this ranch was purchased by Darius Ogden Mills in the 1860's, the name Millbrae then applying only to a railroad station there. In 1867 Millbrae was the name of a postoffice and three years later Mills built his own residence south of the townsite.

Although there were only six families in Millbrae in 1905, the community has developed rapidly since then. It was incorporated in 1948 and has a mayor-council form of government. Pop. (1950) 8,972.

MILLBURY, mīl'bēr-i, town, Massachusetts, in Worcester County, six miles south-southeast of Worcester on the Blackstone River, State Highway 122A, and the New York, New Haven, and Hartford Railroad; altitude 407 feet. Located in an industrial area, Millbury is a manufacturing town producing woolens and felt. Other manufactures are textile supplies, wire, tools, and castings. The New England Power Company which distributes electric power throughout central New England is located here. Nearby many Indian relics have been found.

Settled in 1716, Millbury was incorporated as a town in 1813. It developed rapidly after the opening of the Blackstone Canal in 1828, and on its closing 20 years later, transportation for Millbury's growing textile industry was provided by the Providence and Worcester Railroad. The town includes the village of West Millbury and is governed by a board of selectmen. Pop. (1950) 8,347.

MILLE, mēl, Pierre, French journalist and fiction writer: b. Choisy-le-Roi, near Paris, Nov. 27, 1864; d. Paris, Jan. 15(?), 1941. Receiving his baccalaureate degree from the Collège Rollin in 1885, he entered the Law School and the School of Political Sciences at the University of Paris, where he completed his studies in those subjects. He traveled extensively as a member of expeditions to West Africa, the Congo, Indo-China, and India, and served as a war correspondent for the *Journal des Débats* during the Greco-Turkish War (1897). From 1901 to 1932 he contributed the column *En Passant* to the Paris newspaper *Le Temps*.

Among his many published writings, including novels and short stories, are *Le Congo Léopoldien* (1903); *Barnaveaux et Quelques Femmes* (1908); *L'Ange du Bizarre* (1921); *Christine et Lui* (1926); *Mes Trônes et mes Dominations* (1930); *Chez les Hommes de l'Ombre et du Soleil* (1932).

MILLEDGE, mīl'tj, John, American soldier and politician: b. Savannah, Ga., 1757; d. Feb. 9, 1818. At the dawn of the Revolution he was one of Joseph Habersham's party which captured the colonial government of Savannah. When the British took Savannah Milledge fled to South Carolina. He was at the sieges of Savannah (1779) and of Augusta, and rendered good service in the patriot army.

Appointed attorney-general of Georgia in 1780, Milledge later served in the Legislature, was representative in Congress 1792-1802, twice governor of the State 1802-1806 and United States senator 1806-1809. He is remembered for his donation of land to the University of Georgia and was honored by having Milledgeville, the first capital of Georgia, named after him.

MILLEDGEVILLE, mīl'tj-vīl, city, Georgia, seat of Baldwin County, 29 miles northeast of Macon on the Oconee River, state and federal highways, and the Georgia and the Central of Georgia railroads. It is also served by an airport with airline facilities. At an altitude of 325 feet, Milledgeville is situated in a rich agricul-

tural region for which it is an important trade center. Nearby clay deposits and forests have contributed to the growth of the clay products and lumber industries in the city. Manufactures include tile, brick, clothing, candy, and lumber. Other important industries are dairying, cattle raising, and cotton ginning.

In addition to its public school system, Milledgeville has the Georgia Military College and the Georgia State College for Women. From 1835 to the Civil War, and for a few years after the war, Milledgeville was the seat of the original Oglethorpe University, a name that was revived, in 1913, for the present college near Atlanta. Besides the college libraries, there is a county library in the city, and the State College for Women supports a museum, with collections of manuscripts and documents bearing upon the history of the South.

Milledgeville was laid out by state surveyors in 1803 as a site for a state capital, and named for John Milledge, the revolutionary soldier who was then governor. It was incorporated in 1836 and in 1868 the capital of the state was moved to Atlanta. A mayor and council administer the government. Pop. (1950) 8,835.

MILLENNIUM, mī-lĕn'ī-ŭm, (Lat. *mille*, 1,000, and *annus*, a year), a period of 1,000 years. Hence it is a term applied to the period during which, according to some, Jesus Christ will return to reign on earth before the end of the world. This premillennial appearance of Christ will be signalized by a first or particular resurrection of the just, who are to reign with Him on earth, and by the destruction of Antichrist. Those who hold such views are called millenarians or chiliasts, and their tenet chiliasm (Gr. χίλιος, 1,000). It is admitted on all sides that these views were, if not general, at least very common in the ancient church. The belief was generally founded on Psalms xc, 4, according to which 1,000 years are before the Lord as one day, compared with the account of the creation as given by Moses. The six days of creation are taken as designating 6,000 years of toil, and the subsequent sabbath as designating 1,000 years of rest and happiness. The millennium was to be the sabbath rest of the new creation of mankind in Christ. Besides these passages, Revelation 21:1-6, is especially quoted by chiliasts in support of their views.

Chiliasm prevailed chiefly among the Jewish Christians, who retained after their conversion the hope that they would rule over all other nations under a royal Messiah (q.v.). The Ebionites, the Nazarenes and Cerinthians all advocated it and Montanus, and the sect which was called after him, regarded it as a fundamental doctrine of the Christian religion. Some early fathers of the Church also declared themselves generally in favor of the doctrine; Papias, Irenaeus and Tertullian were chiliasts; and Papias appealed in support of his view to apostolic traditions. On the other hand, however, the epistles of Clement of Rome and Ignatius of Antioch are silent about it.

Justin Martyr who wrote in the 2d century was a believer in the millennium. "I and all Christians whose belief is in every respect correct," he says, "know that there will be both a resurrection of the flesh and a thousand years in Jerusalem, which will then be rebuilt, adorned and enlarged, as the prophets Ezekiel, Isaiah and

others declare." This view was opposed by the whole Alexandrian school, especially by Origen, who believed in a spiritual supramundane interpretation of Revelations. Still it continued to find advocates during the 3d century, among whom Tertullian, Nepos, bishop of Arsinoe, and Methodius, bishop of Tyre, were prominent.

In the 4th century, Jerome, who did not believe in it himself, did not dare to condemn it, in consideration of the many pious and learned advocates it had found in former centuries. Soon after it began to die out; it was temporarily revived toward the close of the 10th century, by the popular belief in the approaching end of the world, but it never regained great strength.

The reformation of the 16th century gave a new impulse to chiliasm. Fanatical opinion identified the Pope with Antichrist, and regarded the anticipated downfall of the Roman Catholic Church as foreshadowing the approach of the millennium. But when the Anabaptists undertook in 1534 to erect the New Zion, both the Lutheran and Reformed churches declared themselves against this reversion of the old doctrine. Yet it was preached by many sectarians and theologians of the 16th and 17th centuries, among whom were Weigel and the Moravian bishop Comenius in Germany, Jurieu in France, the Labadists in the Netherlands, and Joseph Mede and Jane Lead (d. 1704) in England.

A third period in the history of chiliasm may be commenced with the writings of the esteemed exegete and New Testament commentator, Johann Albrecht Bengel. He practically reintroduced it into Protestant theology, where it has ever since been advocated by a number of prominent theologians. The ingenious prelate Friedrich Christoph Oetinger (d. 1782) brought it into connection with his favorite theosophic views. August Hahn (the founder of a pietistic sect in Württemberg), Johann Heinrich Jung-Stilling, and Johann Kaspar Lavater gave it a wide circulation among the lower classes of the people in Germany and Switzerland. In opposition to the "spiritualism" of modern exegesis, it was advocated, with exegetical arguments, by Hoffmann, Franz Delitzsch, Johann Heinrich Kurtz, and others; while Heinrich Thiersch, Karl Emanuel Nitzsch, Johann Peter Lange and August Ebrard supported it from a dogmatical as well as an exegetical standpoint. Swedenborg taught that the last judgment took place in 1757, and that the New Church or church of the New Jerusalem had actually been formed both in-heaven and on earth.

After Germany, England and America have been the chief fields of modern chiliasm. The "Catholic Apostolic Church," organized by Edward Irving, laid great stress on the belief that the kingdom of glory was very near. Chiliasm lies at the foundation of Mormonism, whose adherents call themselves Latter Day Saints in reference to the near approach of the last day.

In the United States great excitement was caused by the preaching of William Miller (q.v.) who sought to prove from the Scriptures that the second advent of Christ would take place about 1843. He not only met with numerous chiliasts in most denominations, but he also founded the sect of Adventists (q.v.).

Chiliasm has been seriously taken in declarations of doctrine formulated by several churches. The Augsburg Confession implicitly repudiates it, speaking of "the last

days foreshown in Holy Scripture, in which the world is to become ever more and more degenerate and mankind more sinful and weak." The Council of Trent declares that "the Scriptures also inform us that the General Judgment shall be preceded by the preaching of the Gospel throughout the world, a defection from the faith and the coming of Antichrist." There is a sort of millennium also looked forward to by those who disbelieve in religion as the renovator of the world. According to these teachers there is a material millennium quite within the range of future possibilities. They teach that the race must look to its renewal and improvement by the nonpropagation of disease and impotency of every nature, and to the persistent and joyous multiplication of the best elements of our race, in a continual progress toward the hierarchy of life. The millennium, according to this newly invented philosophy, will come by natural and not supernatural means. See ESCHATOLOGY; RESURRECTION; JEWS AND JUDAISM—Zionism.

H., *Critical History of the Doctrine of the Future Life* (London 1899); Davidson, S., *Doctrine of Last Things* (London 1900); Drummond, J., *Jewish Messiah* (London 1877); Elliott, E. B., *Horae Apocalypticæ* (London 1862); MacCulloch, *Early Christian Visions of the Other World* (Edinburgh 1912); Newton, I., *Dissertations on the Prophecies* (London 1755); Salmond, S. D. F., *Christian Doctrine of Immortality* (3d ed., Edinburgh 1897); Seis, J. A., *The Last Times* (2d ed., Philadelphia 1878); Stanton, V. H., *The Jewish and Christian Messiah* (Edinburgh 1886); Terry, M. S., *Biblical Apocalypics* (New York 1898).

MILLEPEDE, a myriapod of the *Chilognatha*, the second order of the class *Myriapoda* in which each segment of the body, except a few of the front joints, bears two pairs of legs—the joints in the nearly related centipedes (q.v.) bearing each one pair only. The common species (genus *Julus*) are found in damp places, concealed under stones, or under the bark of trees. The body consists of from 40 to 50 joints, protected by a horny skin, and when irritated or at rest these animals coil up for protection. The mouth is provided with a pair of strong jaws or "mandibles"; and the antennae or feelers consist of six or seven joints. See MYRIAPODEA.

MILLEPORE, family (*Milleporidae*) of *Hydrozoa*, remarkable for secreting massive calcareous skeletons like corals, with which they were for a long time classed. The hydranths are of two kinds: gastrozooids, or feeding polyps, which provide nourishment for the colony, and dactylozooids, which are elongated, mouthless, protective polyps provided with large numbers of nematocysts. The generative cells are remarkable for their wanderings through the tissues of the polyps and colonies. The colonies are hermaphrodite, but the related family *Stylasteridae* has unisexual colonies. They live in warm seas and form reefs in shallow waters. *Millepora alcicornis* is abundant near low water in the West Indies, where

representatives of the *Stylasteridae* also occur in deep water.

MILLER, Adolph Caspar, American economist: b. San Francisco, Calif., 7 Jan. 1866. He was graduated at the University of California in 1887 and studied at Harvard, Paris, and Munich. He was connected successively with the faculties of Harvard, the University of California, and Cornell; was professor of finance at the University of Chicago in 1892–1902, and Flood professor of economics and commerce at the University of California in 1902–13. He served as assistant to the Secretary of the Interior in 1913–14, and until 1936 was a member of the Federal Reserve Board. He published *The Monetary Problem in the United States* (1895).

MILLER, Benjamin LeRoy, American geologist, b. Sabetha, Kans., 13 April 1874. He studied at the University of Kansas and two colleges in the same state. After serving as teacher in the public schools of Kansas he became an assistant on the Kansas University Geological Survey in 1896, professor of biology and chemistry at Penn College, Oskaloosa, Iowa, 1897–1900 and served on the Iowa Geological Survey in 1899. He was associate professor in geology at Bryn Mawr College, 1903–1907, and after that time was appointed professor of geology at Lehigh University. He was special consulting editor of the *Engineering and Mining Journal*, 1920–22, and from 1904 served on several state geological surveys, including that of the United States. He was a member of numerous learned societies and the author of several scientific treatises. Died Bethlehem, Pa., 23 March 1944.

MILLER, Charles Henry, American landscape painter: b. New York City, 20 March 1842; d. Queens, N.Y., 21 Jan. 1922. Graduated from Mount Washington Collegiate Institute, New York, exhibiting his first oil painting at National Academy of Design, 1860. He received the degree of M.D. from the New York Homeopathic College in 1863, but after his first trip to Europe as surgeon of a ship in 1864 he resolved to devote his life to the fine arts. He studied at the Bavarian Royal Academy with Adolf Lier from 1867 to 1870, when he returned to America. He was president of the New York Arts Club for five years, having become a member of the National Academy of Design in 1875. His paintings are principally landscapes of Long Island. He received the gold medal from Boston and New Orleans international expositions. His best-known work, *The Bouquet of Oaks*, is in the Metropolitan Museum. His *Sunset, East Hampton* (1878) is in the Brooklyn Museum; *High Bridge* hangs in the Democratic Club, New York. He was a lecturer, and author, under the pen name of Carl de Muldor, of *The Philosophy of Art in America* (1885).

MILLER, Cincinnatus Hiner (better known as JOAQUIN MILLER), American poet, whose pseudonym was due to his defense of Joaquin Murieta, a Mexican bandit: b. Wabash district, Ind., 10 Nov. 1841; d. San Francisco, Calif., 17 Feb. 1913. His father took him to Oregon in 1854. He had a little schooling but soon ran away from home; went to the California gold mine; accompanied Walker on the

filibustering expeditions in Nicaragua. He lived among the Digger Indians near Mount Shasta, Calif., between 1857 and 1859, and subsequently returned to Oregon, leaving behind an Indian wife and a young daughter. He then briefly attended Columbia College in Eugene, Oreg., studied law in his spare time while teaching school at Clarke, in the Washington Territory, and was admitted to the bar in Portland, Oreg., in 1861. He did not practice, but founded a pony express route, and in 1863 bought the Eugene *Democratic Register*, which was soon suppressed by the United States government because of its pro-Confederate tendency.

Miller removed to Canyon City, Oreg., where, after winning favor by leading a posse against hostile Indians, he was elected judge of the Grant County court in 1866. He published two volumes of verse, *Specimens* (1868) and *Joaquin et al* (1869), which brought him to the attention of literary circles and enabled him to become acquainted with prominent authors in San Francisco, notably Bret Harte. Subsequently he visited England and became a London celebrity with the publication of his *Pacific Poems* (1870). He was lionized as a romantic figure of the American West by the literary circle of William Michael Rossetti, and a revision of *Pacific Poems*, issued as *Songs of the Sierras* (1871), was praised by British reviewers.

He returned to the United States in 1872 but subsequently visited Europe, South America, and possibly the Near East, meanwhile continuing to write and publish. After residing for brief periods in New York and other eastern cities, he settled in Oakland, Calif., in 1887. He was a special correspondent in the Klondike for the *New York Journal* in 1897-1898.

Miller's many published writings included *Songs of the Sun-lands* (1873); *Life Amongst the Modocs* (1873); *The Ship in the Desert* (1875); *The Baroness of New York*, a novel (1877); *Songs of Italy* (1878); *Shadows of Shasta* (1881), a prose romance; *The Danites in the Sierras* (1882), a drama; *The Destruction of Gotham* (1886), a novel; and *The Building of the City Beautiful* (1893), a Utopian essay. *The Complete Poetical Works of Joaquin Miller* appeared in 1897 (rev. ed., 1902), followed by *Joaquin Miller's Poems* (6 vols., 1909-1910).

Consult Peterson, Martin S., *Joaquin Miller, Literary Frontiersman* (Palo Alto, Calif., 1937).

MILLER, Dayton Clarence, American physicist and musicologist: b. Strongsville, Ohio, March 13, 1866; d. Cleveland, Ohio, Feb. 22, 1941. He received a doctorate in physics from Princeton University in 1890, and was professor of physics from 1893 at the Case School of Applied Science (now Case Institute of Technology) in Cleveland, Ohio. Among his major scientific contributions were studies of the relative motion of the earth and ether, and the photographing of sound waves. He was the author of *Sound Waves, Shape and Speed* (1937); *Sparks, Lightning, Cosmic Rays* (1939); and of several works on music, notably *Boehm on the Flute and Flute-Playing* (1908); *The Science of Musical Sounds* (1916); and *An Anecdotal History of Sound* (1935).

MILLER, Edward, American physician: b. near Dover, Del., May 9, 1760; d. New York, N. Y., March 17, 1812. He began to study medicine with a physician at Dover, was a surgeon's mate in the Revolutionary War, and subsequently practiced at various places in Delaware and Mary-

land, meanwhile studying intermittently at the University of Pennsylvania, where he received a doctorate in medicine in 1789.

Miller settled in New York City in 1796, and there joined in founding the first medical periodical in the United States, the *Medical Repository* (August 1797). He served as physician to the Port of New York from 1803, and helped to start the College of Physicians and Surgeons (1807). An authority on yellow fever, he recognized that it was not communicated from person to person. He studied the epidemic in New York in 1805, and wrote a celebrated report on it, entitled *Report on the Malignant Disease which Prevailed in the City of New York in the Autumn of 1805: Addressed to the Governor of New York* (1806).

MILLER, Ferdinand von, German bronze founder: b. Fürstentfeldbruck, Germany, Oct. 18, 1813; d. Munich, Feb. 11, 1887. He studied bronze founding and sculpture in Munich under his uncle, Johann Baptist Stiglmeier, whom he succeeded as director of the Royal Bavarian Foundry in 1844. He cast many celebrated bronzes, notably a statue representing Bavaria, in Munich, and the bronze door of the Capitol at Washington, D.C.

BARON FERDINAND VON MILLER (b. Munich, Germany, June 8, 1842; d. there, Dec. 19, 1929), his son and pupil, became director of the Bavarian Academy of Fine Arts in 1900 and received the title of baron in 1912. He cast statues of Shakespeare and Columbus in St. Louis, Mo.; figures for a fountain in Cincinnati, Ohio, and for the Soldiers' Monument in Charleston, S. C.; and an equestrian statue of Emperor William I at Metz, in Lorraine.

OSKAR VON MILLER (b. Munich, Germany, May 7, 1855; d. there, April 9, 1934), another son of the elder Ferdinand, was an electrical engineer. He organized the first German electrical exposition, at Munich (1881), and was a co-founder and director (1884-1890), with Emil Rathenau, of the Allgemeine Elektrizitäts-Gesellschaft (General Electric Company) in Berlin. He was also president of the International Electrical Exhibition at Frankfurt (1891), where he demonstrated the practicability of high-tension alternating current transmission over long distances. In 1903 he founded the Deutsches Museum, devoted to science and technology, in Munich.

MILLER, Frieda Segelke, American public official: b. La Crosse, Wis., April 16, 1889. A lifelong champion of improved working conditions, especially for women, she was educated at Milwaukee-Downer College and the University of Chicago, and in 1918 became secretary of the Women's Trade Union League in Philadelphia, serving until 1923. In 1929 she was appointed director of the women's division of the New York State Department of Labor and, after nine years in that position, was made industrial commissioner of New York State, the second woman to occupy the office. Miss Miller improved the administration of the state's unemployment insurance laws and re-employment services, and worked to eliminate racial and religious discrimination in employment. She resigned at the end of 1942, and in the summer of 1944 was chosen by President Franklin D. Roosevelt to head the Women's Bureau of the United States Department of Labor, remaining in office until November 1953.

Miss Miller also represented the United States at many meetings of the International Labour Organisation and various organs of the United Nations.

MILLER, Harriet Mann (pen name OLIVE THORNE MILLER), American author: b. Auburn, N. Y., June 25, 1831; d. Los Angeles, Calif., Dec. 25, 1918. She was educated at private schools in Ohio and, after her marriage in 1854 to Watts Todd Miller, went to live in Chicago. Here, pursuing a life-long interest, she began to write and lecture about birds and their habits. A children's book, *Little Folks in Feathers and Fur, and Others in Neither* (1875), was well received. It was followed by *Queer Pets at Marcy's* (1880), *Bird-Ways* (1885), *A Bird-Lover in the West* (1894), *The First Book of Birds* (1899), *True Bird-Stories from My Note-book* (1903), and *The Children's Book of Birds* (1915). Her extensive knowledge of birds, founded on personal observation rather than scientific research, and the unaffected charm of her writing have given her books a lasting appeal for adults as well as children.

MILLER, Henry, American author: b. New York, N. Y., Dec. 26, 1891. He attended the College of the City of New York and subsequently resided in Paris, where his first books were published. His fiction became well known for its experimental style, its surrealist fantasy, its frank treatment of sex and morals, and its pictures of life in the Bohemias of New York and Paris. Several of his works were banned as obscene in the United States and Britain. Miller is the author of *Tropic of Cancer* (1934), *Tropic of Capricorn* (1938), *The Cosmological Eye* (1939), *The Colossus of Maroussi* (1941), *The Air-Conditioned Nightmare* (1945), and *The Smile at the Foot of the Ladder* (1948).

MILLER, Henry (John), American actor and theater manager: b. London, England, Feb. 1, 1860; d. New York, N. Y., April 9, 1926. He accompanied his parents to Toronto, Canada, at an early age, became interested in the theater, and made his debut as an actor before he was 19. Coming to the United States, he played supporting roles opposite several stars, notably Helena Modjeska, Adelaide Neilson, Clara Morris, Fanny Janauschek, and Minnie Maddern, and gained valuable experience as a member of a celebrated troupe managed by Dion Boucicault in New York City.

Miller was leading man of the Empire Theatre Stock Company, under Charles Frohman, after 1890, and was an established star after 1896. He scored a triumph with his own production of *The Great Divide*, by William Vaughn Moody, at the Princess Theatre, in New York in 1906. Subsequently he produced and acted in numerous successful plays, including *The Havoc* (1911), *Daddy Long Legs* (1913), *La Tendresse* (1922), and *The Changelings* (1923). After 1918, his productions appeared in New York at Henry Miller's Theatre, designed and built under his supervision.

MILLER, Hugh, Scottish geologist and author: b. Cromarty, Scotland, Oct. 10, 1802; d. Portobello, near Edinburgh, Dec. 23, 1856. Apprenticed to a stone mason at 17, he was prompted to a life-long interest in geology by the sight of

some ripple marks in the bed of a quarry. While working as a journeyman mason between 1822 and 1834 he read widely, studied geological formations in various parts of Scotland, formed friendships with persons of literary interests, and began to write verse and essays.

His *Poems Written in the Leisure Hours of a Journeyman Mason* (1829) received the praise of prominent critics, and his *Letters on the Herring Fishery* (1829), originally published in the *Inverness Courier*, gained him a local reputation.

He became an accountant in a bank at Cromarty in 1834 and continued to pursue various literary, religious, and scientific interests. His *Scenes and Legends of the North of Scotland* (1835), containing a chapter on geology, broadened his reputation, and in 1840 he became editor of *The Witness*, a periodical established at Edinburgh by leaders of the Scottish Free Church movement to advocate popular control of the Church of Scotland. In this publication he first brought out the articles subsequently collected as *The Old Red Sandstone, or New Walks in Old Fields* (1841), his most important geological work, illustrated with his own drawings of rocks and fossils, which first drew attention to the importance of this formation as a source of fossil remains.

A devout Christian, Miller defended the doctrine of special creation and maintained that the Bible, rightly interpreted, was not contradicted by geological discoveries. He believed that the six days of creation mentioned in Genesis correspond to six geological eras, of which he found evidence in rock formations. This theory he set forth in *The Footprints of the Creator, or the Asterolepsis of Stromness* (1847), and in *The Testimony of the Rocks* (1857). *My Schools and Schoolmasters*, an autobiography, appeared in 1852.

MILLER, (David) Hunter, American lawyer and government official: b. New York, N. Y., Jan. 2, 1875; d. Washington, D.C., 1932. He graduated from the New York Law School in 1910, was admitted to the bar in 1911, and subsequently practiced law in New York City.

An authority on legal and other problems of international relations, he became a special assistant in the State Department in June 1917, and helped prepare data used at the Peace Conference at the end of World War I. He was legal adviser to the American commission to the conference (1918-1919); co-author, with Sir Cecil Hurst, of the final draft of the League of Nations Covenant; and a member of the delegation that submitted the American disarmament plan to the League (1924). Subsequently he returned to the State Department as treaties editor (1929) and historical adviser (1931). He was the author of numerous articles and books on international affairs, notably *My Diary at the Conference of Paris, with Documents*, 21 vols. (1924-1926); *The Drafting of the Covenant*, 2 vols. (1928), and *The Peace Pact of Paris* (1928).

MILLER, James Russell, American Presbyterian clergyman and author: b. Harshville, Pa., March 20, 1840; d. Philadelphia, July 2, 1912. He was educated at Westminster College, New Wilmington, Pa., and the Allegheny Theological Seminary of the United Presbyterian Church, where he graduated in 1867 and was ordained a minister. He was editorial superintendent of the Presbyterian Board of Publication

in Philadelphia from 1887 until his death, and was the author of more than 60 devotional books, notably *Devotional Hours with the Bible*, 8 vols. (1909-1913), which sold more than two million copies.

MILLER, Joaquin. See **MILLER, CINCINNATUS HINER.**

MILLER, Johann Martin, German novelist and poet: b. Ulm, Germany, Dec. 3, 1750; d. there, June 21, 1814. He studied theology at Göttingen and subsequently was a clergyman at Ulm. He was the author of sentimental novels in the manner of *Die Leiden des jungen Werthers* by Johann Wolfgang von Goethe. Among them were *Siegwart, eine Klostergeschichte* (1776); *Beitrag zur Geschichte der Zärtlichkeit* (1776); *Briefwechsel dreier akademischer Freunde* (1776-1777); and *Geschichte Karls von Burgheim und Emilens von Rosenau* (1778-1779). His lyric poem, *Was frag ich viel nach Geld und Gut*, became widely known.

MILLER, John Henry (Ger. JOHANN HEINRICH MILLER or JOHANN HENRICH MILLER), German-American printer, editor, and publisher: b. Rheden, Germany, March 12, 1702; d. Bethlehem, Pa., March 31, 1782. He was apprenticed in 1715 to a printer at Basel, Switzerland, and subsequently published a newspaper at Zurich. In 1741-1742 he visited Philadelphia and for a short period worked in the printing shop of Benjamin Franklin. Returning to America in 1751, he joined Samuel Holland in founding a bilingual newspaper, *Die Lancastersche Zeitung*, in Lancaster, Pa. After another sojourn in Europe (1754-1760), Miller took up residence in Philadelphia, where in 1762 he established a newspaper, *Der Wöchentliche Staatsbote*, which continued to appear under various titles until 1779. As a patriotic gesture, he suspended it in protest against the Stamp Act, from Oct. 31 to Nov. 18, 1765. He also published a yearly almanac in German and other books in German and English, notably Thomas Godfrey's *Juvenile Poems* (1765), which contained *The Prince of Parthia*, the first play by an American to be produced professionally in America.

Henrich Miller's Pennsylvanische Staatsbote was the first newspaper to announce the adoption of the Declaration of Independence, carrying the news on July 5, 1776. The paper was again suspended in September 1777 because of the occupation of Philadelphia by British troops. It was reestablished in August 1778, but Miller retired from business the next year and removed to Bethlehem, Pa.

MILLER, John Peter, German-American Protestant clergyman: b. Zweikirchen, Germany, Dec. 25, 1709; d. Ephrata, Pa., Sept. 25, 1796. He attended the University of Heidelberg and in 1730 emigrated to Philadelphia, where he was ordained and engaged as a minister by various German Reformed congregations. Influenced by Johann Conrad Beissel (q.v.) to adopt a life of ascetic rigor, he renounced the Reformed Church in 1735 and retired to the Seventh Day Baptist cloister at Ephrata, where he remained until his death. He succeeded Beissel as head of the Ephrata Community in July 1768.

Miller edited various books published by the Seventh Day Baptist press at Ephrata, corre-

sponded with Benjamin Franklin, George Washington, and other prominent men, and became widely known for his learning. He was chosen by the Continental Congress to translate the Declaration of Independence into various European languages.

MILLER, Joseph or Josias (known as JOE MILLER), English comic actor: b. 1684; d. London, England, Aug. 16, 1738. He first appeared at the Drury Lane Theatre in London in 1709 and from 1714 was a regular member of the company there, playing comic roles in all the popular favorites of the day. He is remembered chiefly because of the title of a book, *Joe Miller's Jests, or the Wit's Vade Mecum*, a collection of 247 jests compiled by John Mottley, which appeared in 1739. Three of the jests are told of Miller, but he had no other connection with the volume. It was reissued in so many revised and enlarged editions that any stale joke came to be called "a Joe Miller."

MILLER, Kenneth Hayes, American painter and etcher: b. Oneida Community, Oneida, N. Y., March 11, 1876; d. New York, N. Y., Jan. 1, 1952. He attended the Art Students' League and the New York School of Art in New York City, and subsequently studied in Europe. He taught drawing and painting at the New York School of Art between 1899 and 1911 and at the Art Students' League between 1911 and 1936 and again in 1943. Miller was awarded the gold medal for painting by the National Academy of Design in 1943 and the Ada S. Garrett prize at the Chicago Art Institute annual American painters' exhibit in 1945. His works, characteristically scenes of life in New York City, are represented in numerous collections, notably in the Museum of Modern Art, the Whitney Museum, and the Metropolitan Museum, New York City.

MILLER, Lewis, American inventor and philanthropist; b. Greentown, Ohio, July 24, 1829; d. New York, N. Y., Feb. 17, 1899. He worked as a machinist for the Ball brothers, manufacturers of reapers and mowing machines in Greentown, and in 1852 became a partner in Ball, Aultman & Company, which established its plant in Canton. When another plant was founded in Akron in 1863, Miller became its manager. He made several improvements in the design of mowing machines and binders.

In 1874, at Chautauqua Lake, N. Y., Miller and John H. Vincent organized the first Chautauqua Assembly, which became a regular annual summer event thereafter, providing educational and recreational activities for tens of thousands of adult visitors (see CHAUTAUQUA MOVEMENT). He remained active as a director of the institution until his death. Miller's daughter, Mina, became the wife of Thomas Alva Edison in 1886.

MILLER, Max, American author: b. Traverse City, Mich., Feb. 9, 1899. He served in the United States Navy during World War I, attended the University of Washington, and after traveling in the South Pacific, settled in San Diego, Calif., where he worked as a reporter. His first book, *I Cover the Waterfront* (1932), a volume of vivid reportage on the lives of San Diego maritime workers, scored an immediate success and was made into a motion picture. It was followed by *The Great Trek* (1935) and

Fog and Men on Bering Sea (1936), accounts of life in Alaska, and *Mexico Around Me* (1937), an unusual travel book dealing mainly with the southernmost part of the country. Miller's first novel, *A Stranger Came to Port* (1938), tells the story of a business executive who escapes for a year from his respectable surroundings to live on a houseboat among waterfront characters. During World War II, Miller again served in the navy and wrote several books based on his experiences.

MILLER, Olive Thorne. See MILLER, HARRIET MANN.

MILLER, Patrick, Scottish inventor: b. Glasgow, Scotland, 1731; d. Dalswinton, Dumfriesshire, Dec. 9, 1815. He was engaged in business as a merchant and banker in Edinburgh from 1760, became a director of the Bank of Scotland in 1767, and was deputy governor of the bank from 1790 until his death. He was also an important stockholder in the Carron Iron Company, manufacturers of ordnance, and participated in experiments for improving the naval cannon produced by the concern.

In October 1788, he demonstrated the practicability of steam navigation by sailing an experimental boat, with paddle wheels powered by a steam engine, on a lake at his estate of Dalswinton, Dumfriesshire, where he resided after 1785. In his old age he introduced the cultivation of florn grass into Scotland. Miller was for a time the landlord of the poet Robert Burns, and was occasionally his benefactor.

MILLER, Samuel Freeman, American jurist: b. Richmond, Ky., April 5, 1816; d. Washington, D.C., Oct. 13, 1890. He received a doctorate in medicine from Transylvania University in Lexington, Ky., in 1838, and subsequently practiced in the neighborhood of Barbourville, Knox County. Here he became a justice of the peace and a member of the county court. In 1847, after studying law privately, he abandoned medicine to become an attorney.

An antislavery Whig, Miller in 1850 removed to Keokuk, Iowa, hoping to find a community congenial to his moderate abolitionism. He established a successful law practice and, following the decay of the Whig Party, helped to organize the Republican Party in the state. In 1862 he was nominated by President Abraham Lincoln to succeed Peter V. Daniels as associate justice of the United States Supreme Court. The nomination was unanimously confirmed in the Senate because of the strong support of Republican politicians in Iowa and other Western states.

Miller soon became a prominent figure on the Supreme Court bench. His decisions were based on his view of what best served the national interest, with due regard to states' rights, rather than on legal and historical precedents. He admitted that he lacked scholarly training in the law, but regarded a sense of justice and a concern for the national well-being as more important than historical arguments concerning the meaning of the Constitution.

While a member of the Supreme Court, Miller wrote more than 600 majority decisions. In the so-called Slaughterhouse Cases (q.v.), he rendered the first important interpretation of the 14th Amendment, ruling that its guarantees apply only to rights and privileges held under federal, and not under state, law. He was a Republican mem-

ber of the Electoral Commission of 1877, and voted with the majority that decided the disputed presidential election of 1876 in favor of Rutherford B. Hayes.

MILLER, William, American religious leader: b. Pittsfield, Mass., Feb. 15, 1782; d. Hampton, N. Y., Dec. 20, 1849. He had little formal schooling, but read widely in books borrowed from educated neighbors at Hampton, N. Y., where he spent his childhood and youth. After some years as a farmer at Poultney, Vt., he fought in the War of 1812, and then returned to Hampton to resume farming. During these early years Miller was a deist, but in 1816 he underwent a religious conversion. Minute study of the Bible for the next 15 years convinced him that various passages prophesied the second coming of Jesus and the end of the world in 1843. He began to preach the second coming publicly in 1831, attracting large audiences and gaining many adherents.

In 1836 he published a volume of lectures entitled *Evidence from Scripture and History of the Second Coming of Christ, about the Year 1843*. His teachings were given wide circulation after 1839 in publications issued by one of his disciples, Joshua Vaughan Himes, whose activities as a publicist for Miller led to the formation of a nation-wide Adventist movement. Miller traveled from town to town conducting revival meetings in which he preached the second coming and urged his hearers to prepare for the fatal day.

The Adventists, or Millerites as they were sometimes called, finding that the second coming did not take place in 1843, fixed on Oct. 22, 1844, as the prophetic date. As the day approached, thousands abandoned their occupations in expectation of the world's end. Disappointed a second time, Miller did not lose faith, but thenceforth refrained from trying to predict the date of the advent.

Up to this time, Miller's adherents had retained their membership in the established Protestant churches, but in 1845 rising dissension between his followers and other Protestants led to the formation of a separate Adventist Church. Miller soon retired from active leadership, but his disciples carried on his teachings, which in essentials formed the basis of several successor denominations that stemmed from the Adventist Church. See also ADVENTISTS.

MILLER, William, English soldier: b. Wingham, Kent, England, Dec. 2, 1795; d. Callao, Peru, Oct. 31, 1861. He entered the supply department of the British Royal Artillery in 1811, served under the 1st duke of Wellington in campaigns against Napoleon on the Iberian Peninsula and southern France (1811-1814), and accompanied British expeditionary forces to the United States towards the end of the War of 1812. After two years of travel in Europe, he joined the forces of Gen. Bernardo O'Higgins in the Chilean war for independence. Miller was commandant of marines aboard the flagship of the Chilean fleet in 1818, defeated a Spanish garrison at Pisco, Peru, in August 1821, and subsequently was made governor of the Peruvian Province of Ica. He became general of a brigade in the Peruvian Army in 1823, and later the same year was promoted by the Peruvian commander in chief, Simón Bolívar, to the rank of commander in chief of cavalry. At the decisive Battle of Ayacucho, July

1824, he distinguished himself by leading a brilliant cavalry charge.

After a four years' visit to Europe, Miller returned to Peru in 1830 and held important civil and military posts there until 1839, when changes in political control caused his banishment. He became British consul general in the Pacific in 1843 and died while on a mission to the Peruvian government.

MILLER, William, Scottish line engraver: b. Edinburgh, Scotland, May 28, 1796; d. Sheffield, England, Jan. 20, 1882. Educated in England and at the University of Edinburgh, he was apprenticed to an engraver in Edinburgh between 1811 and 1815, and subsequently was a pupil of George Cooke in London. He returned to Edinburgh in 1821 and became a successful engraver of landscapes. After 1837 he was known for his book illustrations and for engravings based on the paintings of Joseph M. W. Turner. He did the illustrations for the Abbotsford edition (1842-1847) of the *Waverley Novels* by Sir Walter Scott, and executed plates (1839) for the celebrated biography of Scott by John Gibson Lockhart, and for two editions of poems by Thomas Hood (1871, 1872).

MILLER, William, Scottish poet: b. Glasgow, Scotland, August 1810; d. there, Aug. 20, 1872. He became a wood turner or maker of wooden vessels at an early age, and worked at the trade until a few months before his death. He contributed verse regularly to the Scottish miscellany *Whistle Binkie*, and was especially well known for his nursery rhymes, notably *Wae Willie Winkie*. A collection of his verse, *Scottish Nursery Songs and Other Poems*, was published in 1863.

MILLER, William Allen, English chemist: b. Ipswich, England, Dec. 17, 1817; d. Liverpool, Sept. 30, 1870. At the age of 15 he became a surgical apprentice to his uncle, Bowyer Vaux, at Birmingham General Hospital, and later studied medicine at King's College, London, receiving a doctorate in 1842; but his major interest was chemical research. He became assistant lecturer in chemistry at King's College in 1841 and professor of chemistry there in 1845.

Miller devised new methods for using spectrum analysis to determine the chemical identity of substances, demonstrating in 1862, by means of photographs, the existence of characteristic differences in the spectra of 25 metals. Subsequently, with Sir William Huggins (q.v.), he made photospectroscopic analyses of the light of various stars and obtained the first reliable detailed information about solar and stellar chemistry.

MILLER, William Hallows, British mineralogist: b. Velindre, near Llandovery, Wales, April 6, 1801; d. May 20, 1880. He was educated at Cambridge University and became professor of mineralogy there in 1832. His important book, *A Treatise on Crystallography* (1838), established the simplest and most accurate system of classifying crystals devised up to that time, and remained a standard work throughout the 19th century. Miller also took a prominent part in reconstituting the standards of weight and linear measure after the destructive fire in the Parliament buildings in 1834.

MILLER, William Henry Harrison, American jurist: b. Augusta, N. Y., Sept. 6, 1840; d. Indianapolis, Ind., May 25, 1917. He graduated from Hamilton College in 1861, served briefly in the 84th Ohio Infantry in the Civil War, and subsequently studied law privately in Toledo, Ohio, and Peru, Ind. He was admitted to the bar in 1865 and eventually, in Indianapolis, became a law partner of Benjamin Harrison, 23d president of the United States. When Harrison assumed office in 1889, Miller became attorney general in his cabinet and one of his closest political advisers. As attorney general, Miller was known for his impartiality and his refusal to bow to political influences.

MILLER, Willoughby Dayton, American dentist and bacteriologist: b. near Alexandria, Ohio, Aug. 1, 1853; d. Newark, July 27, 1907. He graduated from the University of Michigan in 1875 and subsequently studied chemistry, physics, and mathematics at the University of Berlin. In 1877, after working on a research project with F. P. Abbot, an American dentist in Berlin, Miller decided to adopt dentistry as his profession. He received a doctorate in dental surgery from the University of Pennsylvania in 1879, returned to Berlin, and began to practice with Abbot. In 1884 he was appointed professor of dentistry at the University of Berlin, and received a doctorate in medicine there in 1887.

Miller made important contributions to the knowledge of the chemical and bacterial causes of dental and oral disease. Using extracted teeth, he demonstrated in the laboratory that decay is the result of the acids formed by bacteria in the human mouth. His researches and his skill as a dentist brought him numerous honors. In 1894 he was appointed professor extraordinary on the medical faculty of the University of Berlin, one of the few foreigners and the first dentist to receive such an appointment. He was president of the National Dental Association of Germany and personal medical counselor to Emperor William II. He returned to the United States in 1907 to become dean of the dental college of the University of Michigan, but died before he could assume his post. He was the author of numerous articles on dentistry and of *The Micro-Organisms of the Human Mouth* (1890).

MILLER, the popular name for any moth whose wings appear to be covered with a dust or powder resembling the flour on a miller's clothes. By many entomologists, however, the name is restricted to members of the family Noctuidae—medium to large, hairy moths, with long antennae and strong wings, which are found all over the world, most abundantly in forests and plains. The family comprises about 500 genera and 20,000 species. The larvae of many species, known commonly as cutworms or army worms, are destructive pests.

MILLERAND, mèl-rän', Alexandre, French statesman: b. Paris, France, Feb. 10, 1859; d. Versailles, April 6, 1943. He studied law at the University of Paris, became an attorney in 1881, and the following year began to contribute articles to the periodical *Justice*, founded in 1880 by Georges Clemenceau. He entered the Chamber of Deputies in 1885 as a Socialist, and in 1889 founded the newspaper *Voix* to advocate socialism. Millerand assumed management of the Socialist periodical *La Petite République* jointly with

René Viviani in 1893, but in 1899 broke with the majority of Socialists, led by the Marxists Jules Guesde and Jean Jaurès, to become minister of commerce in a coalition cabinet of moderates and liberals under René Waldeck-Rousseau. He was instrumental in securing the enactment of far-reaching social legislation limiting hours of labor and providing for old age pensions, the latter adopted in 1905, after he had left office.

While minister of public works under Aristide Briand (1909–1910), Millerand broke a general strike of railroad workers in October 1910 by temporarily drafting them into the French Army. He was minister of war in the cabinet headed by Raymond Poincaré (1912–1913) and again during World War I under Viviani (1914–1915), and served simultaneously as premier and foreign minister from January to September 1920, when he was elected president of the French Republic. His repeated attempts to intervene in the conduct of affairs, however, led to his downfall. In 1924 Edouard Herriot refused to assume the premiership while Millerand was president, and he was forced to resign. He remained in public life as a senator from 1925 to 1940.

MILLEROVO, mīl-ě-rō'vō, Russ. myīl-lyě-rō'vū, city, USSR, located in Rostov Oblast, Russian Soviet Federated Socialist Republic, 120 miles northeast of Rostov. It is an important rail junction on the Moscow-Rostov line and a distributing and industrial center, with flour and oilseed mills, machine manufacturing plants, and railroad repair shops. In World War II, it was taken by German troops in July 1942 and recaptured, after a four weeks' siege, by the Red Army in January 1943. Pop. (1926) 12,822.

MILLER'S TALE, *The*, one of the *Cantebury Tales*, by Geoffrey Chaucer (qq.v.). It concerns the deception practiced on an old husband, a carpenter of Oxford, by his young wife and a clerk who lodges with them. The source of the tale is unknown. It was composed about 1390.

MILLER'S-THUMB, a common English and American name for several species of small, fresh-water fish of the genus *Cottus*. They are smooth skinned, and are remarkable for their disproportionately large heads, flattened like the proverbial miller's thumb. They feed on insects, small crustaceans, algae, and the eggs of other fishes.

C. gobio, common in streams in England, northern Europe, and northern Asia, seldom grows more than 4 or 5 inches long; it is brownish above and whitish beneath. *C. bairdii* and *C. cognatus*, common in clear, rocky streams in North America east of Missouri, grow up to 5 or 6 inches long. Olive green, or brownish mottled with darker brown, they readily blend with the appearance of stream bottoms or tangles of pondweed. Their spawning season is from April to July; the eggs, about one eighth of an inch in diameter, are laid in pinkish clusters of one or two hundred. Miller's-thumbs are also known as bullheads, but differ from the common American catfish so called. -

Consult Gill, Theodore N., *Miller's Thumb and Its Habits*, Smithsonian Institution Miscellaneous Collections (Washington, D.C., 1910).

MILLERSBURG, mīl'ěrz-bürg, village, Ohio, county seat of Holmes County, in the cen-

tral part of the state, 32 miles southwest of Canton. It is a market and distributing point for an adjoining agricultural region, with some manufacturing (furniture, concrete burial vaults). Nearby are coal mines, sandstone quarries, and gravel pits. The village was settled in 1816. Pop. (1950) 2,398.

MILLERSBURG, borough, Pennsylvania, located in the central part of the state, on the Susquehanna River, in Dauphin County, 20 miles north of Harrisburg. Metal products, shoes, and clothing are manufactured here. The borough was laid out in 1807 and incorporated in 1850. Pop. (1950) 2,861.

MILLERSVILLE, mīl'ěrz-vīl, borough, Pennsylvania, located in the southeastern part of the state, in Lancaster County, four miles southwest of Lancaster. A state teachers college is located here. The borough was incorporated in 1932 and is named for John Miller, who settled here in 1761. Pop. (1950) 2,551.

MILLES, mīl'lēs, Carl (originally WILHELM CARL EMIL ANDERSON), Swedish-American sculptor: b. Lagga, Sweden, June 23, 1875; d. Lidingsö, near Stockholm, Sept. 19, 1955. After receiving his first instruction in carving and modeling at the Technical School in Stockholm, he attended the École des Beaux-Arts in Paris between 1898 and 1900. His work received praise from the celebrated sculptor Auguste Rodin, in whose studio Milles worked for several months, and in 1900 he was awarded an honorable mention for a marble sculpture at the Salon des Artistes Français and a silver medal for a figure at the Paris World Exposition.

His artistic reputation thereafter steadily widened, and by 1914 he was considered by many the foremost Swedish sculptor. In 1920 he was appointed professor of modeling at the Royal Academy of Art, Stockholm, but his artistic development ran counter to prevailing tendencies at the academy, and in 1929 he accepted a position in the sculpture department of the Cranbrook Academy of Art, Bloomfield Hills, Mich. He became a naturalized citizen of the United States in 1945.

Milles executed more than 100 major works, including numerous monumental sculptures for public buildings, parks, and gardens in Europe and the United States. Notable among his sculptures in the United States are *The Meeting of the Waters* in St. Louis, Mo., a group of 19 heroic nude figures representing mythologically the meeting of the Missouri and Mississippi rivers; a wood-carved mural for the Time and Life Building, Rockefeller Center, New York City; the *Fountain of Faith* at Falls Church, Va.; and bronze figures for the courtyards of the Chicago Art Institute and the Des Moines (Iowa) Art Center.

Milles was the recipient of numerous honors, including the decoration of the French Légion d'Honneur and honorary doctorates from universities in Europe and the United States.

Consult Rogers, Meyric R., *Carl Milles: an Interpretation of His Work* (New Haven 1940).

MILLES, Ruth Anna Maria (original surname ANDERSON), Swedish sculptor: b. Vallen-tuna, Sweden, Feb. 10, 1873; d. 1941. A sister of Carl Milles (q.v.), she became known for the delicacy and the elegance of her sculpture.

Among her works are 'Red Riding-hood and the Wolf' (1902); 'Fisherman's Wife'; 'Yvonne,' 'Wildflower,' 'After Waiting,' National Museum (1907), etc.

MILLET, Aimé, â-mâ mē-lā, French sculptor; b. Paris, 1816; d. there, 14 Jan. 1891. He studied art under David d'Angers (see **DAVID**, **PIERRE JEAN**), and the architect Viollet-le-Duc (q.v.), applied himself first to painting, but without great success. He then turned to the plastic arts and exhibited his first statue, a 'Bacchante,' in 1845. This was followed by his 'Ariadne' (now in the Luxembourg), a 'Mercury' and a statue of 'Civic Justice' for the mairie of the First Arrondissement, Paris; the statue of a 'Young Girl' for a monument in the cemetery of Montmartre, an 'Apollo' for the façade of the New Opera House and a bronze statue of 'Vercingetorix' (1865). Among his portrait and personal works are the statues of Chateaubriand at Saint Malo; of Denis Papin, at Blois, and numerous busts. His style has all the realism of modern French sculpture, combined with a certain theatrical demonstrativeness, a vividness of expression, pathetic, tragic or passionate. Consult Dumesnil, 'Aimé Millet, Souvenirs Intimes' (Paris 1891).

MILLET, Francis Davis, American artist, author, war correspondent and illustrator; b. Mattapoiset, Mass., 3 Nov. 1846; d. 15 April 1912, one of the victims of the *Titanic* steamship disaster. During the Civil War he acted as drummer and assistant surgeon. In 1869 he was graduated A.B. and A.M. in 1872 at Harvard University. While contributing and illustrating special articles for American publications he studied, in 1871-72 at the Royal Academy of Fine Arts, Antwerp, and in France and in Italy. In 1877-78 he was official correspondent for the New York *Herald*, the London *Graphic* and the London *Daily News* during the Russo-Turkish War, receiving Russian and Rumanian medals and decorations for bravery. In 1885 he was elected to the National Academy of Design, later to the American Academy of Arts and Letters, and was made an honorary member of the American Institute of Architects. He was awarded medals for pictures exhibited in 1889 at Paris, in 1893 at Chicago where he was in charge of the decorations and functions in connection with the World's Fair, and in 1901 at Buffalo. In 1898 he was correspondent for the London *Times* and *Harper's Weekly* in the Philippines. In 1905-06 he was actively engaged in organizing and securing endowment for the American Academy at Rome, of which he was elected the first secretary. Among his best-known paintings are 'An Old-Time Melody' and 'A Cozy Corner' in the Metropolitan Museum, also 'At the Inn' in the Union League Club, New York city; 'Between Two Fires' in the National Gallery of British Art, London. Portraiture includes paintings of Nicholas Murray Butler, president of Columbia University, and of Mrs. Millet. His best-known works are his five mural paintings, notably the 'Evolution of Navigation' in the Baltimore (Md.) Custom-house, and those in the Essex County Courthouse, Newark, N. J.; the Hudson County Courthouse, Jersey City, N. J.; the Cleveland, Ohio, post office; the Supreme Court at Madison, Wis., and in the Minnesota

State Capitol. Besides his numerous contributions to periodical literature his published books include 'Capillary Crime and Other Stories' (1892); 'The Danube' (1892); 'The Expedition to the Philippines' (1899). With Maj. Archibald W. Butt, another victim of the *Titanic* disaster, he is commemorated by a memorial fountain erected in 1913 in Washington, D. C.

MILLET, Jean François, zhôn frân-swā mē-lā, French painter, the founder of the Barbizon school of painting; b. Gruchy, near Cherbourg, 4 Oct. 1814; d. Barbizon, 20 Jan. 1875. The son of a Norman peasant, he owed much in his childhood to a woman of simple piety and strong individuality, and to her brother, and learned enough Latin to delight in the Vulgate and Virgil. He was educated in the Academy of Design at Cherbourg, and received a bursary from that city which enabled him, in 1837, to proceed to Paris, where he entered the studio of Delaroche. This does not seem to have been a congenial home for his early art life, yet at first he struggled to comply with his surroundings and painted genres in the style of Watteau (q.v.) and Boucher (see **BOUCHER**, **FRANÇOIS**), as well as Biblical and mythological incidents, with landscape backgrounds, and signboards. It was in 1848 that he really found himself, and hit upon the line of art in which he could give utterance to the sincere feelings of his heart. This turning point in his career was marked by the appearance of his genre painting, taken from country life, 'The Winnow.' Henceforth his days were to be spent far from the glitter of Paris, the competition and jealousies of the studios; settling in Barbizon, on the edge of the forest of Fontainebleau, he devoted himself to the study and portrayal of peasant life. The hardship, toil and privation of the farm laborers he sympathized with acutely, and some have even accused him of being a social revolutionist, but he professed no views of this tendency, though his interpretation of the peasant's lot may be too gloomy and pessimistic, and his ironical bitterness of spirit such that it infected his canvas and clouded the beauty of external nature as depicted there. He himself was almost all his life battling with that poverty whose privations had early robbed him of his young wife. There is a profound pathos in his conception of the rural isolation and hardship of soil slavery, with all its stolid but unrequited patience, and this he has portrayed with a certain broad and impressionistic treatment which is both sincere and original. At first, his works were passed by or misunderstood, but gradually they were recognized at their true value, and he was hailed as the greatest painter of modern France. Since his death his pictures have been sold at enormous prices and are looked upon as the most precious pieces in private or public collections.

Millet's greatest picture, the 'Angelus' (1859), was sold by him for 1,800 francs and later brought at auction 800,000 francs. Millet himself sold his picture 'The Woman with the Lamp' for \$2,800 in 1872. Shortly after it was sold for \$4,600 and again for \$7,000. In 1882 it fetched \$18,000. The most important of his other works are 'The Sower' (1850); 'Man Spreading Manure' (1852); 'The Reapers'

1853); 'The Gleaners' (1857, in the Louvre); 'Death and the Woodcutter'; 'La Becquée' (Feeding Her Birds)—a mother feeding her three children from the same bowl. These all belong to his early period when he was tormented with sickness and harassed by debt. After the appearance of the 'Angelus' his reputation was established, but chronic poverty still pursued him. In 1860 he produced his wonderful picture, the 'Sheep-Shearing' in which he seems to express as much pity for the dumb beast as for the patience of the human toiler who is bent over it. In 1862 appeared the 'Potato Planters'; in 1863 'The Wool Carder,' and 'The Man with the Hoe.' In 1867 he was awarded at the Paris Exposition a medal of the first class and the ribbon of the Legion of Honor in 1868. He took refuge in Cherbourg during the Franco-Prussian War, but returned to Barbizon in 1871, where he continued in broken health, though still working with untiring brush, until the end came.

Among the paintings of this artist now in the United States are 'The Sower'; 'The Water Carrier' (Vanderbilt collection); 'A Peasant grafting a Tree' (Rockefeller collection); 'The Turkey Tender' (C. A. Dana collection, New York); 'The Buckwheat Threshers' and the 'Potato Planters' (Quincy Shaw collection, Boston); 'Harvesters Resting' and 'Homestead at Gréville' (Boston Art Museum); 'The Turners' (F. L. Ames collection); 'Potato Diggers' and 'Breaking Flax' (Walters collection); 'The Man with the Hoe' (San Francisco Museum).

The drawings, etchings and pastels of Millet are eagerly sought after and always bring a high price at auction or private sale. The most familiar is his own portrait, a sketch often reproduced. His 'Woman Feeding Chickens'; 'Flock of Sheep with Shepherd'; the 'New-born Lamb'; 'Laundresses on the Shore' are best known. Among his pastels are 'The Vine Dresser' and 'Butter Making.' All his works show masterly drawing, and the landscapes which appear in many of them are put in with in ease and atmosphere worthy of the best periods of French art. His coloring may be sombre, and he disregards the power of the human countenance as giving expression to the sentiment of his conception. But the life of each picture is to be found in the inimitable pose of the figures, and the suggestiveness of the background. The hands, shoulders and feet of these figures, as they move in harmony with forms cumbrous, almost grotesque, are made to suggest the dull torture in which stolid and half-bestial creatures are held under the yoke of toil and poverty. The light reflected upon these figures from religious sentiment or natural affection only serves to intensify the profound melancholy by which the story of their lives is clouded.

MILLET, or MILET, Pierre, French-Canadian pioneer missionary: b. Bourges, France, 1635; d. Quebec, Canada, 31 Dec. 1708. He entered the Jesuit order and in 1667 went to Canada. In 1668 he was sent as missionary to the Iroquois in New York and in 1671 he was placed at the head of the Oneida mission. He succeeded in converting the principal chief and slowly gathered a congregation of considerable proportions. In 1684 he left his work among the Oneidas to accompany De La Barre in his campaign against the Senecas, and he served as interpreter between the Iroquois and the French at Frontenac in 1686. He was stationed at Fort Niagara in 1687 and afterward at Frontenac, in the hope that his experience among the Iroquois might enable him to promote friendly relations between them and the French. During the siege of Frontenac in 1689 he was captured by the Onondagas, who after maltreating him gave him over to the Oneidas. There he was sentenced to the stake but was finally rescued by an Indian convert who succeeded in having him adopted into the tribe. In 1694 he was permitted to return to Quebec, and afterward was petitioned by the Oneidas to return to them. From 1697–1703 he was missionary at Sault-Saint Louis.

MILLET, a popular name for many grasses grown in the Old World as cereals, but in the New almost wholly as forage. The principal ones are true or broomcorn millet (*Panicum milaceum*); foxtail millet (*Setaria italica*); barnyard or Japanese (*Panicum crus-galli*); pearl or cat-tail millet (*Pennisetum typhoidum*) and the African, Chinese, Indian, black and erroneously called "pearl millet" (*Sorghum vulgare*). Sometimes *Elusine coracana* is called African millet. In general they constitute one of the most important groups of food-plants, since they are the staple diet of about one-third of the world's population, the annual plantation in India alone being estimated at approximately 35,000,000 acres. The first three mentioned are the most important groups grown in the United States. The plants all thrive well upon rather light, well-drained soils, which should be prepared as for other cereal crops. In order to make a millet harvest succeed the harvest of other cereals, the seed is sown late in the spring. Broadcasting and drilling are both practised, the latter more extensively. Just after blossoming, the crop may be cut and cured for hay; for seed, just before the seed becomes fully mature to prevent loss from shattering. The hay makes valuable fodder, but some stockmen attribute various animal ailments to its excessive or exclusive use; others experience no such difficulties. The seed may be ground for stock food, but it is little used. For poultry, especially for young chicks, it is widely employed.

MILLIGAN, George, Scottish clergyman: b. 2 Apr. 1860; d. 25 Nov. 1934. He was educated at the universities of Aberdeen, Edinburgh, Göttingen and Bonn, and was afterward minister of Saint Matthews, Morningside, and of Caputh. After 1910 he was regius professor of divinity and religious criticism at Glasgow University, and he served as clerk of the senate after 1911. Author of 'History of the English Bible' (1895); 'The Theology of the Epistle to the Hebrews' (1899); 'The New Testament

Documents: Their Origin and Early History' (1912); coauthor, 'The Vocabulary of the Greek Testament' (1914-15); 'The Church and the New Testament' (1923).

MILLIGAN, Robert Wiley, American rear-admiral: b. Philadelphia, 8 April 1843; d. 14 Oct. 1909. He entered the navy with rank as third assistant engineer and was attached to the United States steamship *Mackinaw* in the North Atlantic Blockading Squadron during the Civil War. He saw service at both battles of Fort Fisher, and was present at the fall of Wilmington, N. C., and of Petersburg and Richmond, Va. He afterward served in the North and South Atlantic and Pacific squadrons, and was on duty as instructor at the United States Naval Academy. He was promoted chief engineer in 1892, in which capacity he served on the United States battleship *Oregon* on her famous run from the Pacific to the Atlantic coast in the Spanish-American War, and also served at the battle of Santiago. He was fleet engineer of the North Atlantic Fleet, on the flagship *New York*, for one year; was promoted commander in 1899 and was chief engineer of the Norfolk navy yard in 1899-1905. He received rank as captain in 1902 and was retired with rank as rear-admiral in 1905.

MILLIGAN, William, Scottish Presbyterian clergyman and commentator: b. Edinburgh, 15 March 1821; d. Edinburgh, 11 Dec. 1893. He was educated at the University of Saint Andrew's, entered the ministry of the Established Church of Scotland, held pastorates at Cameron and Kilconquhar and was professor of Biblical criticism in the University of Aberdeen from 1860. He was moderator of the General Assembly in 1882, and was appointed principal clerk to the assembly in 1886. He was one of the revisers of the New Testament and the author of 'The Higher Education of Women' (1878); 'The Resurrection of Our Lord' (1881); 'Commentary on the Revelation' (1883); 'The Resurrection of the Dead' (1890), etc. He visited the United States in 1872 as a delegate to the Presbyterian General Assembly from the General Assembly of the Scottish Church.

MILLIGAN, Ex Parte, a decision handed down by the Supreme Court of the United States in 1866 holding a military commission to be without power in a State not invaded nor in rebellion, and where the usual civil courts, both Federal and State, were open; rendered by a barely sufficient majority, with Chief Justice Chase and Justices Wayne, Swayne and Miller dissenting, and Chief Justice Chase pronouncing a forcible protest. The case was that of one Lambdin P. Milligan, a United States citizen residing in Indiana, arrested by military authorities in 1864 on a charge of conspiracy, disloyal practices, inciting insurrection and aiding and comforting the enemy. He was found guilty by a military commission and sentenced to death. His counsel filed a writ of habeas corpus in the United States Circuit Court and the case eventually was carried to the Supreme Court, where the military commission was held to be without jurisdiction in his case. Chief Justice Chase asserted that the power of Congress "to authorize trials for crimes against the security and safety of the national forces,

may be derived from its constitutional power to raise and support armies and to declare war", and that while the civil courts "might be open and undisturbed in their functions . . . yet wholly incompetent to avert threatened danger, or to punish, with adequate promptitude and certainty, the guilty conspirators." Consult 'Wallace's Reports of the Supreme Court of the United States' (Vol. IV, 1866).

MILLIGAN COLLEGE, a coeducational institution located at Milligan College, 4 miles from Johnson City, Tenn. It is operated by a self-perpetuating board of trustees. It was originally called Buffalo Male and Female Institute, which name was changed to Milligan College in 1881 by Josephus Hopwood, its president for many years. It offers courses leading to the degrees of bachelor of arts and bachelor of science. The student enrollment averages about 325 a year.

MILLIGRAM, the thousandth part of a gram. See WEIGHTS AND MEASURES.

MILLIKEN UNIVERSITY. See JAMES MILLIKEN UNIVERSITY.

MILLIKEN'S BEND, Engagement at Milliken's Bend, La., on the west bank of the Mississippi, about 15 miles above Vicksburg, was the base of some of the military operations against that place and the lower Mississippi. Early in June 1863, when Grant was besieging Vicksburg from the east, Gen. E. Kirby Smith, commanding the Confederate Department of the Trans-Mississippi, sent Gen. J. G. Walker's division of 4,000 men to seize the place and other points on the river, and open communication with General Pemberton, in Vicksburg, with the object of furnishing him supplies, or failing in that, to cover his escape across the river. Walker moved to Alexandria, La., and reported to Gen. R. Taylor, commanding in West Louisiana, and was sent in transports up the Washita and Tensas rivers, until abreast of Vicksburg, when he landed and marched across to Richmond. At this time Milliken's Bend was held by Gen. E. S. Dennis, with about 1,400 men, mostly colored troops. A reconnoitring party sent out by Dennis was driven back by the Confederates. Walker arrived at Richmond at 10 A.M. on the 6th, and was ordered by Taylor to send one brigade to Young's Point and one to Milliken's Bend, distant respectively 20 and 10 miles, and to hold a third brigade in reserve six miles in advance of Richmond. Harris' brigade moved at night on Young's Point, was delayed and accomplished nothing. Gen. H. E. McCulloch, with a Texas brigade of 1,600 men and 200 cavalry, marched from Richmond at 6 P.M. on the 6th and at 3 A.M. on the 7th, when within one and a half miles of Milliken's Bend, the Union skirmishers were encountered and the Confederate advance driven back in some disorder; but McCulloch rallied his men and pushed on, driving the Union troops back slowly to their main line, carrying the Union breastworks, then driving the Union troops to the bank of the river, where two gunboats came to their assistance and, pouring shells into the ranks of the Confederates, obliged them to withdraw and return to Richmond. The Union loss was 127 killed, 287 wounded and 266 missing; the Confederates lost 44 killed, 131 wounded and 10

missing. Consult *Official Records*, vol. 24.

MILLIKIN, mīl'i-kīn, **James**, American banker and philanthropist: b. Pennsylvania, Aug. 2, 1830; d. Orlando, Florida, March 2, 1909. In 1860 he engaged in banking and later founded the firm of Millikin and Company at Decatur, Ill., now the Millikin National Bank. He was president of the Union Works. He founded the Anna B. Millikin Home, an institution for the care of aged women and children, built and supported mostly by him, and named after his wife, Anna B. Millikin. He also founded the James Millikin University, dedicated in 1904.

MILLIN, mīl-lēn', **Aubin-Louis**, French archaeologist, numismatist, botanist, and mineralogist: b. Paris, July 19, 1759; d. there, Aug. 14, 1818. Imprisoned during the Terror, he proved his revolutionary sympathies by adopting the given name Éleutherophile (Friend of Liberty) and publishing the *Annuaire du Républicain* (1794) where he substituted names of vegetables for those of saints. Keeper of medals and antiquities at the Bibliothèque Nationale, in 1795 he began editing the *Magasin Encyclopédique*. He was author of *Antiquités nationales*, 5 vols. (1790); *Monuments antiques inédits ou nouvellement expliqués*, 2 vols. (1802-1804); *Nouveau dictionnaire des beaux arts*, 3 vols., (1806); *Histoire métallique de la Révolution française* (1806); *Voyages dans les départements du midi de la France*, 5 vols. (1807-1811); *Galerie mythologique*, 2 vols. (1811); *Voyage dans le Milanais* (1817).

MILLIN, mīl'in, **Sarah Gertrude** (nee LIEBSON), South African author: b. Kimberly, 1889. Of Jewish parentage, she began her writing career at 16. Her early novels, *The Dark River*, *Middleclass*, *Adam's Rest* and *The Jordans*, were followed by her most successful *God's Stepchildren* (1924) a poignant tale of "Cape colored people." Later novels include *King of the Bastards* (1950) and *The Burning Man* (1952). Nonfiction books include *The South Africans* (rev. ed. 1934); biographies of Cecil Rhodes and General Smuts; and the autobiography, *The Night is Long* (1941).

MILLINOCKET, mīl-i-nōk'ēt, town, Maine, in Penobscot County, altitude 359 feet, on the Bangor and Aroostook Railroad, 83 miles north of Bangor. In a forested region; has paper mills. Government is by selectmen. Pop. (1950) 5,890.

MILLIS, John, American army engineer: b. Wheatland, Mich., Dec. 31, 1858; d. Cleveland, Ohio, March 30, 1952. On graduating from the United States Military Academy at West Point in 1881 he joined the Engineer Corps. In 1886 he constructed the electric light plant for the Statue of Liberty in New York Harbor, developing a new type of reflector, precursor of modern floodlight projectors, and working with arc lights, incandescent bulbs not yet having been invented. When Lieutenant Millis threw the switch in the Bedloe's Island powerhouse the night of Oct. 28, 1886, the first floodlight in the world bathed the statue. After service in New Orleans supervising harbor works and levees (1890-1894), he was chief engineer of the United States Lighthouse Board (1894-1898), then served with the Engineers' Battalion at Willis

Point, N. Y. and in Cuba, attaining his majority in 1900. During the succeeding 12 years Major Millis had charge of harbor fortification construction on Puget Sound and in the Philippines, also of river and harbor improvements on the Atlantic and Pacific coasts. In 1910 he was promoted colonel. Division engineer of the Southeastern Coast Defenses in 1916, he was appointed chief engineer of the Southeastern Department in 1918, and of the Central Department in 1918. He retired in 1922. He was author of many papers on relativity, gravitation, glaciers, cosmogony, and navigation.

MILLOCKER, mīl'ūk-ēr, **Karl**, Austrian composer: b. Vienna, Austria, April 29, 1842; d. Baden bei Wien, Dec. 31, 1899. He composed operettas and was also an orchestra conductor. His most successful operettas *Der Bettelstudent* (1882), *Gasparone* (1884), and *Der Arme Jonathan* (1890), are still performed.

MILLOM, mīl'ūm, urban district, England, in Cumberland, on the Duddon estuary, nine miles northwest of Barrow and 60 miles north of Liverpool, on the Furness Railway. There is an early Norman church and the dismantled castle of Milom, built in the 11th century and fortified in the 14th century. The park of the castle was turned into farm lands early in the 19th century. The largest known deposits of red hematite in the country are located here, and a seawall and embankment have been built for the mine's protection as part of it lies under the Duddon estuary. There are smelters in the neighborhood and the town owns its water and gasworks, and has a technical school. Pop. (1951) 13,424.

MILLS, Albert Leopold, American army officer: b. New York City, May 7, 1854; d. Washington, D.C., Sept. 8, 1916. He was graduated from the United States Military Academy at West Point in 1879 and was commissioned in the cavalry. He served in several campaigns against the Indians and in 1894-1898 was instructor in the United States Military School at Fort Leavenworth, Kansas. Upon the opening of the war with Spain he was ordered to the front, where he rendered distinguished service at the battles of Las Guasimas and Santiago and was brevetted major and lieutenant colonel. From 1898-1906 he was superintendent at West Point. On July 28, 1902 he was awarded the Congressional Medal of Honor for distinguished gallantry in action near Santiago de Cuba, July 1, 1898, for encouraging those about him, though shot through the head and practically sightless. He was commandant of the Department of Visayas (1907-1908), of the Department of Luzon (1908-1909); of the Department of the Gulf, Atlanta, Ga. (1909-1912); and president of the Army War College after 1912.

MILLS, Benjamin Fay, American clergyman. b. Rahway, New Jersey, June 4, 1857; d. Grand Rapids, Michigan, May 1, 1916. He was graduated from Lake Forest University, Lake Forest, Ill., in 1879, having been ordained to the Congregational ministry a year previous. He held pastorates at Rutland, Vt., Albany, N. Y., and other places; and was a prominent evangelist from 1886 to 1897. In 1897 he withdrew from the Congregational denomination because of disagreements, and for two years held independ-

ent religious meetings in Boston. In October 1899 to October 1903 he was pastor of the First Unitarian Church of Oakland, Cal. From November 1903 to June 1915 he delivered courses of lectures on philosophy, psychology and sociology in leading cities throughout the United States. In June 1915 he returned to the evangelical ministry, was received as a member of the Presbytery of Chicago and resumed his former evangelistic work. Among his books are 'Power from on High' (1899); 'Victory Thru Surrender' (1892); 'God's World' (1893); 'The Divine Adventure' (1904).

MILLS, Clark, American sculptor: b. Onondaga County, N. Y., 1 Dec. 1815; d. Washington, D. C., 12 Jan. 1883. He went South, learned the millwright's trade, worked at New Orleans and later at Charleston, where he was employed by a plasterer, and discovered a method for taking a cast from the living face which enabled him to make plaster busts cheaply. In 1845 he completed a bust in marble of Calhoun, which was placed in the Charleston city hall in 1846. In 1848 he was appointed by the government to execute an equestrian statue of Andrew Jackson. This was the first large statue cast in metal in the United States. Mills was obliged to learn casting, since there was then no foundry in the country adequate to the work, and when the statue was at last completed it was at a loss to himself of \$7,000. This was later repaid to him by Congress in an appropriation of \$20,000 for a replica at New Orleans. His colossal equestrian statue of Washington, depicting the general at the battle of Princeton, was unveiled at Washington on 22 Feb. 1860. He also cast from designs by Thomas Crawford (q.v.) the statue of "Freedom" which was placed surmounting the dome of the capitol in 1863, and took a life-mask of President Lincoln shortly before the latter's death.

MILLS, Darius Ogden, American banker and capitalist: b. North Salem, Westchester County, N. Y., 5 Sept. 1825; d. 3 Jan. 1910. He was educated in the North Salem Academy and the Mount Pleasant Academy, Sing Sing, N. Y. He became cashier of the Merchants' Bank of Erie County, Buffalo, N. Y. In 1849 he went to California where he founded the banking-house of D. O. Mills and Company; from 1864-67 was president of the Bank of California, San Francisco, and after the failure of that institution he again took charge of it until 1878. After 1880 he was largely interested in New York real estate; also prominent in philanthropic enterprises, the Mills hotels being the most noted examples of his generosity.

MILLS, David, Canadian jurist: b. Oxford, Ontario, 18 March 1831; d. 8 May 1903. He was educated at the University of Michigan and entered early upon a public life. He served in the Dominion House of Commons in the Liberal interest 1867-96 and was editor of the *Canada Daily Advertiser*, London, Ontario, 1882-87. In 1876-78 he was Minister of the Interior, was elevated to the Senate in 1896, was Minister of Justice 1897-1902, and in 1902 was appointed a puisne judge of the Supreme Court of Canada. He was an authority on constitutional and international law and was the author of a 'Report on the Boundaries of the Province of Ontario'

(1873); 'Canadian View of the Alaskan Boundary Dispute' (1899); and 'The English in Africa' (1900).

MILLS, Hiram Francis, American engineer: b. Bangor, Me., 1 Nov. 1836; d. 4 Oct. 1921. After graduation from the Rensselaer Polytechnic Institute in 1856 he was engaged in engineering work for the Bergen, N. J., tunnel of the Erie Railroad (1858); for the Brooklyn waterworks (1859); and for those at Cohoes, N. Y., and Lowell, Mass. He was also engaged in engineering work on the Hoosac Tunnel, Fitchburg Railroad, Mass. Mr. Mills' chief distinction is in connection with the control and distribution of water. He was instrumental in planning the control of water power on the Merrimack River at Lawrence and Lowell; was chief engineer of the Essex Company at Lawrence in 1894; consulting engineer of the Boston Metropolitan Water and Sewerage Board; and from 1896 to 1914 engineer member of the Massachusetts Board of Health and chairman of its committee on water supply and sewerage. He also directed the Lawrence Experiment Station investigation of water and sewerage purification. In 1878-93 he designed and built the slow-sand filters of the waterworks of Lawrence, Mass., which began a new era in the purification of water. He was consulting engineer for important works in many cities of the United States and Mexico, and published numerous papers and essays on engineering subjects. Harvard gave him the degree of M.A. in 1889.

MILLS, James, Canadian agriculturist: b. near Bond Head, Ontario, 1840; d. 24 Dec. 1926. He was graduated at Victoria University in 1868. After teaching for many years he became president of the Ontario Agricultural College at Guelph in 1879. As president and organizer of farmers' institutes for 25 years, he greatly promoted agriculture in Ontario. In 1899 he was a member of the San José Scale Commission. In 1904 he was appointed a member of the Board of Railway Commissioners for Canada. From 1890 to 1910 he served on the board of regents for the Victoria University and he also became senator of the Toronto University. With Thomas Shaw he published 'First Principles of Agriculture' (1890).

MILLS, Lawrence Heyworth, American philologist: b. New York, 1837; deceased. He was graduated at New York University in 1857, and at Fairfax Episcopal Theological Seminary, Virginia; and entered the Episcopal ministry in 1861. He was stationed in Brooklyn for six years; retired from the ministry in 1867; studied Gnosticism and the Avesta in Europe 1872-87; and in the last-named year, having established his reputation as an authority on the Zend-Avesta, went on Max Müller's invitation to Oxford, where he became professor of Zend philology in 1898. He contributed largely to Oriental journals various papers on the Gâthâs and early Zoroastrianism; translated 'Zend-Avesta' (Part III in 'Sacred Books of the East,' 1887); and wrote 'Study of the Five Zarathushtrian Gâthâs' (1894); 'Gâthâs of Zarathushtra in Metre and Rhythm' (1900); 'Dictionary of the Gâthic Language of the Zend-Avesta' (1902-14); and 'Zoroaster, Philo, the Achæmenids and Israel' (1903-06); 'Avesta Eschatology Compared with the Books

of Daniel and Revelations' (1908); 'Yasna I,' with Avesta, Sanskrit, Pahlavi, and Persian texts (1910); 'Our Own Religion in Ancient Persia' (1913); 'Lore of Avesta in Catechetical Dialogues' (1914). 'The Creed of Zarathushtra' (1916); 'The Vital Necessity of the Persian Theology to all Biblical Study' (1916).

MILLS, Ogden Livingston, United States public official: b. Newport, R.I., Aug. 23, 1884; d. New York City, Oct. 11, 1937. He was the grandson of Darius Ogden Mills (q.v.). After graduating at Harvard University in 1904 he entered the law school of his alma mater, and in 1908 he was admitted to the New York bar. He practiced his profession in New York City, where he became active in Republican political affairs. Defeated as a candidate for Congress in 1912, and for the New York governorship in 1916, he was elected to the state Senate in 1914, and again in 1916. During United States participation in World War I he saw active service in France with the American Expeditionary Forces, and in 1921 he was elected to Congress for the 17th New York district. He continued as a member through the 67th to 69th Congresses, and in 1927 he was appointed by President Coolidge under-secretary of the treasury. In February 1932, President Hoover made him secretary of the treasury in succession to Andrew William Mellon (q.v.), and he served in this office until that administration terminated in March of the following year. Thereafter he was one of the severest critics of the administration of Franklin Delano Roosevelt. A collection of his public addresses was published under the title *What of Tomorrow?* (1935).

MILLS, Robert, American architect and engineer: b. Charleston, S.C., Aug. 12, 1781; d. Washington, D.C., March 3, 1855. He was a pupil of the architect Benjamin Henry Latrobe (q.v.). Besides designing important structures in Philadelphia, including a single-arch bridge across the Schuylkill, he erected customhouses and marine hospitals in various parts of the United States, and the Washington Monument in Baltimore. In 1837 he was appointed architect of the general government at Washington, D. C., where he built the Treasury, General Post Office, and Patent Office, and designed the Washington Monument. He published *Statistics of South Carolina* (1826); *American Pharos, or Light-house Guide* (1832).

MILLS, Roger Quarles, American lawyer and politician: b. Todd County, Ky., March 30, 1832; d. Sept. 2, 1911. He moved to Texas in 1849 and studied law, and was admitted to the bar at 20, the Texan legislature removing the disability of minority. He began practice at Corsicana. In 1859 he was elected to the Texas legislature. On the outbreak of the Civil War he joined the Confederate Army and served throughout the war; he fought at Arkansas Post, Chickamauga, Missionary Ridge, and Atlanta, reaching the rank of colonel. In 1872 he was elected to Congress as a Democrat, serving till 1892; he was chairman of the House Committee on Ways and Means, and drafted the Mills Tariff Bill, which, however, failed to become a law. In 1892 he was elected to the Senate to fill an unexpired term, and in 1893 was re-elected for the full term of six years.

MILLS, Thomas Wesley, Canadian physiologist and educator: b. Brockville, Ontario, 1847; d. 1915. He was educated at Toronto University and studied medicine at McGill University, Montreal, afterward completing his course in Germany and England. In 1910 he became professor emeritus of physiology at McGill, after having taught there from 1882. He was one of the founders of the Society for the Study of Comparative Physiology, in 1885. His publications included, *Text Book of Animal Physiology* (1889); *Text Book of Comparative Physiology* (1890); *How to Keep a Dog in the City* (1891); *The Dog in Health and Disease* (1892); *Nature and Development of Animal Intelligence* (1898); and *Voice Production in Singing and Speaking on Scientific Principles* (1906).

MILLS COLLEGE, at Mills College (P.O.) in Alameda County, Calif., was founded in 1852 as Mills Seminary for Young Women. It was chartered as a college in 1885; the preparatory department was discontinued in 1911. The B.A., M.A., B. in Mus., and M. in Ed., are the degrees granted. The college is divided into schools of fine arts, language and literature, social institutions, natural sciences, education, and graduate study. About 660 women are enrolled annually.

MILLSAPS COLLEGE, in Jackson, Miss., founded in 1892 by the Methodist Episcopal Church, South. The courses of study lead to the degrees of A.B., and B.S. only. The college is coeducational, and enrolls about 300 students annually.

MILLSPAUGH, mīlz'pô, Arthur Chester, American political scientist: b. Augusta, Mich., March 1, 1883. He graduated at Albion College in 1908, and secured a Ph.D. degree at Johns Hopkins University in 1916. In 1918, after teaching political science at the latter institution for a year, he joined the staff of the State Department, Washington, D.C. In 1922 he went to Persia (later Iran) as administrator general of finances, and in 1927, after serving in that post for five years, the State Department loaned his services to the government of Haiti as financial adviser and general receiver of customs. He became a member of the staff of the Institute for Government Research in 1929, and for some years following he was engaged in making surveys of several of the states of the American Union, including Mississippi, Alabama, New Hampshire, Iowa, and Oklahoma. In January 1943 he returned to Iran as administrator general of finances, heading a staff of 50 American citizens assisting in re-establishment of stability in a country greatly affected by the rivalries of great powers during World War II. Returning to the United States in January 1945, he declared that his mission had terminated because the United States government had withdrawn its support at the behest of the Soviet Union. This assertion was stated by the State Department to be without foundation; it reported that Millspaugh had been employed solely by the Iranian government, which terminated his contract after the Parliament had cancelled his economic authority. His books included: *The American Task in Persia* (1925); *Haiti Under American Control* (1931); *Crime Control by the National Government* (1937).

MILLSTONE, either of the two cylindrical stones used to grind grain into flour. The best rock for the purpose is buhrstone (q.v.). The lower stone is usually fixed; the upper is the "runner." Each stone is deeply scored with furrows, which lead the milled grist away from the center; the intervals are styled "land"; and the hole in the center is called the "eye." A depression about the eye is the "bosom." The scheme for scoring the stone varies greatly. In the United States, millstones have been almost entirely superseded by steel rollers in the manufacture of flour.

MILLSTONE GRIT, a hard, siliceous conglomerate (q.v.) found, in the United States, at the base of the Pennsylvania coal measures series of the Carboniferous (q.v.) system. The formation occurs practically throughout the Appalachian Range. In Pennsylvania the beds are coarse and over 1,200 feet thick; the rock is light in color and is called Pottsville conglomerate. It is interstratified with some sandstone, thin beds of carbonaceous shells, and thin beds of coal.

MILLTOWN, borough, New Jersey, in Middlesex County; altitude 50 feet; 3 miles south of New Brunswick. Manufactures include textiles, clothing, furniture polish, cables, and paper products. It was incorporated in 1889. Government is by mayor and council. Pop. (1940) 3,515; (1950) 3,786.

MILLVALE, borough, Pennsylvania, in Allegheny County; altitude 900 feet; on the Allegheny River, opposite Pittsburgh; served by the Pennsylvania Railroad. It has a meat-packing plant and manufactures iron and steel products. It was incorporated as a borough in 1868. Pop. (1950) 7,287.

MILLVILLE, city, New Jersey, in Cumberland County; altitude 35 feet; at the head of tidewater on the Maurice River, 10 miles southeast of Bridgeton, on the Pennsylvania-Reading Seashore Lines Railroad. There are river fisheries, and manufactures include glass, textiles, bricks, concrete products, and fertilizers. When first settled in 1720 it was important as a market for sea fish. In 1806 German glassmakers established a glass factory here. Millville was incorporated as a town in 1801 and received its city charter in 1866. Government is by a commission. Pop. (1940) 14,806; (1950) 16,041.

MILMAN, Henry Hart, English historian and divine: b. London, Feb. 10, 1791; d. near Ascot, Sept. 24, 1868. He graduated at Brasenose College, Oxford University in 1814, and was professor of poetry at Oxford from 1821 to 1831. Ordained in 1816, in 1835 he was made rector of St. Margaret's and canon of Westminster; and he was dean of St. Paul's from 1849 until his death. He wrote dramas, epic poems, and hymns, but was best known for his historical works. His *History of the Jews* (1830) gave offense by his treatment of Jewish history from the secular point of view. He wrote *A History of Christianity to the Abolition of Paganism in the Roman Empire* (1840). His greatest work was *A History of Latin Christianity down to the Death of Pope Nicholas V* (1855). In 1838 he edited *The Decline and Fall of the Roman Em-*

pire, by Edward Gibbon and wrote a *Life of Gibbon* (1839). One of his best-known hymns is *When Our Heads Are Bowed with Woe*.

MILMORE, Martin, American sculptor: b. Sligo, Ireland, Sept. 14, 1844; d. Roxbury Highlands, Boston, Mass., July 21, 1883. He moved to Boston in 1851 and in 1860 began studying sculpture under Thomas Ball. Later he studied in Rome where he made a bust of Pope Pius IX. His Soldiers' and Sailors' Monument on Boston Common, generally regarded as his greatest work, was dedicated in 1877. He also executed the Soldiers' Monument at Forest Hills Cemetery, Roxbury, Mass. His portrait bust of Charles Sumner was placed in the Metropolitan Museum, New York City; that of George Ticknor, in the Boston Public Library; and a bronze copy of that of Wendell Phillips is also in the Boston Library, to which it was presented by the Phillips Memorial Association in 1900. One of his best-known works (made in collaboration with his brother Joseph) was the huge granite Sphinx in Mount Auburn Cemetery, Cambridge, Mass.

MILNE, mīln, A(lan) A(lexander), English poet and playwright: b. London, Jan. 18, 1882. He was educated at Trinity College, Cambridge University, where he edited *The Granta*. From 1906 to 1914 he was assistant editor of *Punch*; a collection of his contributions to that weekly was published under the title *Those Were the Days* (1929). He achieved wide popularity with his volumes of verse and prose for children which include: *When We Were Very Young* (1924); *Winnie-the-Pooh* (1926); *Now We Are Six* (1927); *The House at Pooh Corner* (1928). His son was the model for Christopher Robin.

Among his adult prose works are *The Day's Play* (1910); *Once on a Time* (1917); *The Red House Mystery* (1921); *Two People* (1931); *Four Days' Wonder* (1933); *It's Too Late Now* (1939); *Behind the Lines* (1940); *Birthday Party* (1949); *A Table Near the Band* (1950).

His comedies, successful on both the New York and London stages, include: *Belinda* (1918); *Mr. Pim Passes By* (1919); *The Romantic Age* (1920); *The Truth About Blayds* (1921); *The Ivory Door* (1927); *Michael and Mary* (1930); *Toad of Toad Hall* (1930); *Miss Elizabeth Bennet* (1936); *Sarah Simple* (1937); *Gentleman Unknown* (1938).

MILNE, John, English geologist and seismologist: b. Liverpool, Dec. 30, 1850; d. Isle of Wight, July 30, 1913. He was educated at King's College and the Royal School of Mines, London, and practiced as a mining engineer in Cornwall, Lancashire, central Europe, and Newfoundland, besides accompanying an expedition to Arabia as geologist. In 1875 he was appointed by the Japanese government to the chair of geology and mining in the Imperial College of Engineering at Tokyo, where he married a Japanese lady and remained nearly 20 years. In 1880 he founded the Seismological Society of Japan from which hundreds of observing stations sprang up all over the country—a land subject to perhaps a thousand earthquake shocks a year. With the assistance of English colleagues, Milne was the first to devise instruments for recording these shocks, and his investigations led to the precision now obtaining

in the science of seismology. Shortly before leaving Japan his residence was destroyed by fire; all his books, instruments and 2,000 volumes of the *Transactions of the Seismological Society of Japan* were lost. Returning to England in 1895, Milne and his wife settled in the Isle of Wight, where he erected a famed seismological observatory and equipped it with instruments that recorded shocks in any part of the globe. His principal works, *Earthquakes* (1883) and *Seismology* (1898) became standard textbooks.

MILNE-EDWARDS, Henri, French zoologist: b. Bruges, Belgium, Oct. 23, 1800; d. Paris, July 29, 1885. His parents were English. He studied medicine in Paris, taking his degree in 1823. Soon he turned his attention to zoology. After teaching for several years in the Collège de Henri IV, he was elected in 1838 a member of the Académie de Sciences. His *Recherches anatomiques sur les crustacés*, published in 1828, attracted attention, and from that time until his death he published books and essays on his specialty. He taught natural history, and became a noted educator, as well as an original investigator. In 1837 he became editor of the zoological department of the *Annales des sciences naturelles*, which he held for 50 years, and to which he was a contributor. In 1841 he became professor of entomology in the Jardin des Plantes (Museum of Natural History), Paris, where, 21 years later, he succeeded Étienne Geoffroy Saint-Hilaire (q.v.) in the chair of zoology. In 1864 he became director of that famous institution. The Royal Society of England honored him in 1850 with the Copley Medal for his zoological work. Milne-Edwards was the first to describe the important biological principle of the physiological division of labor. Although a contemporary of Charles Robert Darwin and Thomas Henry Huxley, Milne-Edwards was little influenced by those men of science and held to the doctrine of special creations instead of the evolution theory. In the work of his latest years he was assisted by his son, ALPHONSE (1835-1900), who was a specialist in the study of fossil birds and deep-sea exploration. Milne-Edwards published *Éléments de zoologie ou leçons sur l'anatomie, la physiologie, la classification, etc., des animaux* (1834-35), which had an enormous circulation, and was much used as a basis for manuals of zoology; a revision of Lamarck's *L'histoire naturelle des animaux sans vertèbres* (1836-45), and with Dehayes *Leçons sur la physiologie et l'anatomie comparées de l'homme et des animaux* (1855-84); *Histoire naturelle des crustacés* (1834-40) and *Histoire naturelle des corallinaires* (1857-60) were noteworthy. His *Lectures on the Physiology and Comparative Anatomy of Man and the Animals* (14 vols., 1857-81) were valued for their great fund of information and ample references. He also published *Natural History of the French Coasts* (1832-45) and *Natural History of the Mammalia* (1871).

MILNER, Alfred, 1st Viscount MILNER, British statesman and colonial administrator: b. Giessen, Germany, March 23, 1854; d. Canterbury, Kent, May 13, 1925. He studied in Germany, where his father was instructor in English at the University of Tübingen, and at King's College, London, before entering Balliol College,

Oxford University. Graduating in 1877, he was elected to a fellowship at New College, Oxford, and in 1881 he was called to the bar at Inner Temple. In 1886, after five years on the editorial staff of the *Pall Mall Gazette*, he became private secretary to George Joachim (later Viscount) Goschen (q.v.), and in 1889 he was appointed undersecretary of finance in Egypt. His *England in Egypt* (1892), published following his return to Britain, was an important account of the occupation of the country. During 1892-1897 he served as chairman of the board of inland revenue, in 1895 receiving a knighthood for his services. In 1897 he was sent to South Africa as governor of the colony of the Cape of Good Hope and high commissioner for South Africa, and in the latter capacity he was the principal British representative in negotiations with the government of the South African Republic (Transvaal) respecting the demand of the Uitlanders (q.v.) for the franchise in that country. The discussions culminated in a conference at Bloemfontein, in June 1899, between Sir Alfred Milner and President Paul (Stephanus Johannes Paulus) Kruger (q.v.), and with its failure the South African War (q.v.) ensued. With British annexation of the Transvaal and the Orange Free State in 1901, he relinquished the governorship of the Cape of Good Hope to become administrator of the two states, and when the war ended the next year he drafted the terms of surrender which were signed at Pretoria on May 31. Created a viscount, he served as governor of the Orange River Colony and the Transvaal until December 1905, laying the groundwork for the self-government which they secured two years later. In the years that followed he took a prominent part in advocating an imperial federation, tariff reform, and compulsory national service. When David Lloyd George became prime minister of Great Britain in December 1915, in the midst of World War I, he chose Lord Milner, for long a bitter political opponent, to be a member of his small War Cabinet; appointed secretary of state for war in April 1918, he continued to hold office until victory had been achieved. After the general election in December 1918, he became colonial secretary; in this capacity, during 1919, he attended the Paris Peace Conference and was a signatory to the Treaty of Versailles, and late in the year he headed a special mission to Egypt which reported in favor of granting that country's independence. When he retired from public life in 1921, the Order of the Garter was conferred upon him. Although possessed of high administrative gifts, a certain reserve, sometimes called harshness, prevented Lord Milner from ever becoming a popular figure. He was accused of being a bureaucrat of the Prussian type, while with equal unreason he was regarded as opposed to progress of all kinds. His death was due to sleeping sickness, contracted while on a visit to South Africa. His *Credo* (1925), found among his papers, was published posthumously. Consult Headlam, C., *The Milner Papers* (London 1931-33).

MILNES, Richard Monckton. See HOUGHTON, RICHARD MONCKTON MILNES.

MILO, mī'lō, or **MILON**, ancient Greek athlete of late 6th century B.C. He was a native of Crotona, in Magna Graecia, Italy, and cele-

brated for his great strength. He bore off the prize six times in the Olympic games, and on an equal number of occasions at the Pythian. Many anecdotes are related of him. He once carried a heifer of four years to the sacrifice on his shoulders, killed it with a blow of his fist, and afterward, it is added, ate the whole of it on one day. His death is characteristically related. When enfeebled by age, he attempted to rend open the trunk of a tree partially split by woodcutters, but the wood, closing on his hands, held him fast, and he was attacked and devoured by wolves.

MILO, Titus Annius Papianus, Roman tribune and political leader: b. Lanuvium 95 B.C.; d. district of Thurii, 48 B.C. In 57 B.C., when tribune of the plebs, his quarrel with Publius Clodius (q.v.) began. Seeking preferment in the state, he became the ally of Gnaeus Pompey, urging the recall of Cicero from exile, whither he had been sent at the instance of Clodius, as a pretext for their acts. Bands of gladiators in the employ of Milo and of Clodius kept Rome in constant terror by their skirmishes. Finally, in a clash at Bovillae, on the Appian Way, Clodius was murdered Jan. 20, 52 B.C. Milo was impeached for acts of violence in occupying public places and going about under arms, and for bribery in his canvass for the consulship. His trial began April 4, 52 B.C., Cicero undertaking his defense, but the hostility of the Clodius faction was so marked that his speech was not delivered. In a revised and enlarged form it was sent by Cicero to Milo at Massilia (Marseilles), whither he had gone into exile upon his condemnation under the first count. In 48 B.C., Milo returned to Italy and joined Marcus Caelius in rebellion against Julius Caesar.

MILO, or MILOS. See MELOS.

MILORADOVICH, myl'-lŭ-rá'dŭ-vyich, Mikhail Andreevich, Russian army officer: b. 1771; d. St. Petersburg (later Leningrad), Dec. 26, 1825. He fought in the wars against Turkey (1787-1791), Poland (1793), and Italy and Switzerland (1799); and in 1805, as a lieutenant general, he commanded a division at Austerlitz. In 1812 he was in command of a corps at the indecisive Battle of Borodino, and in the subsequent retreat of Napoleon's Grand Army from Moscow he was active in destroying the rear-guards. In 1819 he was appointed military governor of St. Petersburg, and he met his death there while attempting to put down the rising of the Decembrists (q.v.).

MILOS, mē'lōsh, prince of Serbia, founder of the Obrenovich dynasty: b. 1780; d. Belgrade, Sept. 27, 1860. In early life a herdsman, he became a leader of the opposition to the Karageorgevich faction. Although given an official post by the Turks, he turned against them because of their cruelties and in 1815 conducted the Serbian war of liberation. In 1817 he made himself ruler of Serbia; a national assembly, in 1827, proclaimed him hereditary prince, and this was formally recognized by the Turks in 1830. The people revolted because of his tyrannical methods, and forced his abdication in 1839. He was succeeded by his son, Milan, who died the same year; a second son, Michael, then ruled until 1842, being followed by Alexander, son of

Karageorge, who was deposed by the national assembly in 1858. Milos was then recalled to power, but did not live long to exercise it.

MILOVANOVIC, mē'lō-vā'nō-vich, Milovan, Serbian jurist and statesman: b. Belgrade, March 2, 1863; d. there, July 1, 1912. The first Serb to obtain a doctorate of law at the University of Paris, he was appointed professor of international law at Belgrade University. He had a considerable share in drafting the Serbian Constitution of 1888, and became minister to Rome in 1901; despite the overthrow of the Obrenovich dynasty in 1903, he retained his diplomatic post, continuing as minister until 1907. In that year he represented Serbia at the Second Hague Conference, and was named a member of the Permanent Court of Arbitration, and in 1908 he became minister of foreign affairs. He guided the country through the crisis which followed annexation of Bosnia and Hercegovina (q.v.) by Austria-Hungary in the fall of that year. From 1911 until his death he served as prime minister; he concluded a treaty with Bulgaria which paved the way for creation of the Balkan League (q.v.).

MILREIS, mīl'rās, formerly the monetary unit of Portugal, and also of Brazil. The word *milreis* is Portuguese for thousand reis, name of an earlier monetary unit displaced because of its depreciation. The Portuguese milreis was replaced by the escudo in 1911; and the cruzeiro was substituted for the Brazilian milreis in 1942.

MILTIADES, mīl-tī'á-dēz, Athenian general: b. ? 540 B.C.; d. ? 489 B.C. He was a descendant of the Philaides and, after being archon at Athens in 524, inherited a minor principality in the Chersonese in 518. He governed well there; accompanied Darius against the Scythians in 515, and being left at the bridge across the Danube, urged its destruction in order that Greece might thus be rid of a possible Persian enemy. This plan was vetoed by Histiaeus, another Greek tyrant. In 493 he left his kingdom for fear of the Persians, and upon their invasion of Greece in 490 became one of the 10 generals of the Athenian Army. Each of the other generals retired in Miltiades' favor, but he refused to lead the army until his own day of command came. Then he won the great Battle of Marathon, routing the Persian land forces. The victorious general in the next year asked the state of Athens for a fleet of 70 ships, and got his request, but did not explain that he wished to punish the people of Paros from motives of private revenge; when his expedition failed and its purpose became known, he was impeached, fined 50 talents, and imprisoned for lack of ability to pay. He died in prison of a wound received at Paros.

MILTIADES, Saint (also called **MELCHIADES**), pope or bishop of Rome from c. 310 to 314. He is best known as having sat as presiding officer at a synod held at Rome in 313, by desire of the Emperor Constantine, to hear a petition from the Traditones or Catholics in North Africa who had, on demand of the Emperor Diocletian, given up their sacred books and thus, in the opinion of those who resisted the demand, forfeited the rights and privileges of church membership. The action of the Traditones split the church

into two bitter factions, a condition that continued for more than a century. Nothing is known of the early life of Miltiades, save that he was born in Africa, and the date of his death is uncertain. See also DONATISTS.

MILTO. See ASPASIA THE YOUNGER.

MILTON, John, American politician: b. Jefferson County, Ga., April 20, 1807; d. near Marianna, Fla., April 1, 1865. He was educated in Louisville, Ga., where he studied law and, following his admission to the bar, practiced for two years. He practiced law in Columbus, Ga., Mobile, Ala., and New Orleans, La., until 1846, when he settled in Florida on a plantation near Marianna. In 1849 he was elected to the state Senate, and in 1861 became governor. As chief executive of Florida during the Civil War, he did not always agree with the Confederate military authorities as to the best means of defending the state, but he raised, outfitted, and dispatched troops for the Confederate Army, provided hospital supplies, and met Confederate requisitions for money promptly. As the war drew to an end, he became mentally ill at the prospect of the defeat of the South and committed suicide.

MILTON, John, English poet: b. London, England, Dec. 9, 1608; d. there, Nov. 8, 1674. He was the son of John Milton (1563?-1647), who had come up to London from his ancestral home at Stanton St. John near Oxford and risen to prosperity as a scrivener or law writer. Richard Milton, the poet's grandfather, was a Roman Catholic and is said to have disinherited his son for deserting the ancient faith. The elder Milton, like other scriveners, was also a money broker. We have records of his career in the form of lawsuits growing out of this activity. Milton himself inherited investments and was involved to some extent in legal matters. He was later to thank his father for not forcing him to go into law or business, but encouraging him rather in his propensity for the pursuit of humane letters. It is an important fact of Milton's early environment that his father was an accomplished musician, having perhaps been educated as a chorister at Christ Church College, Oxford. He was associated with some of the outstanding composers of the day in the publication of both secular and religious part songs and is said to have been honored by Continental patrons. A number of his compositions remain in manuscript. The poet himself pursued music as an avocation throughout his life. He was afterward to speak of his father as a fellow artist and to have as an early friend and collaborator Henry Lawes, the chief successor of the great Elizabethan and Jacobean school of madrigalists, whom it is natural to suppose he had met as one of his father's younger associates.

Milton's mother, Sarah Jeffrey, was the daughter of a merchant tailor. Of her personality we learn only that she was a woman of "incomparable virtue and goodness," and that she was known throughout the parish for her charities. The poet had an elder sister, Anne, who married when he was 15, and a younger brother, Christopher, born in 1615 after the deaths of two earlier children. The usual opinion that the Milton home was Puritan rests on

plausible conjecture. The house in Bread Street, where Milton was born, was in the parish of All Hallows. The minister, Richard Stock, was an eminent member of the preaching brotherhood who were in the poet's early life laying the foundations for church reform. The choice of Young, a minister of Presbyterian leanings, as Milton's tutor and of Cambridge, where the Puritan tradition was strong, as his university, is also evidence of the affiliation of the family with the rising movement.

Education. Milton's education was very carefully looked after. He was sent to St. Paul's School, perhaps as early as the usual age of 7, but the fact that he was some two years older than the average student at the time of his graduation suggests either that he began late or that his schooling was interrupted. Thomas Young, the Puritan minister already mentioned, was certainly his tutor at some time. There is every evidence that Milton was an eager and proficient student. He says of himself that from his twelfth year he rarely went from his lessons to bed before midnight, and adds that this was the first cause of injury to his eyes. He speaks also of a great enthusiasm for the study and imitation of the Roman poets and the early discovery by his elders of a genius for composi-

John Milton, from a portrait dated 1670.

tion in prose or verse. The biographer John Aubrey says that Milton was already a poet by the age of 10. Milton maintained a companionship in Latin poetry with Alexander Gill, son of the headmaster and himself an instructor in the school. His other great friend there was Charles Diodati, whose father was a distinguished physician of Protestant Italian ancestry.

Milton took up residence at Christ's College, Cambridge, in the spring of 1625 at the age of 16. He is said by Aubrey on the authority of Christopher Milton to have quarreled with his first tutor, William Chappell, and to have received corporal punishment. There seems to be an allusion to this event in the first Latin elegy, written perhaps toward the end of his second year, in which he speaks of being about to go back to his forbidden college room, but the incident is a rather shadowy one. He was thereafter transferred to another tutor, and there is no evidence of further trouble. Cambridge was at that time already the scene of ideological contention. Milton belonged to the more progressive humanistic group, and his letters and college exercises record disapproval of scholastic study and of those students who devoted themselves to shallow disputation at the expense of solid learning in the ancient authors. Milton was intending at this time to go into the min-

istry and would naturally have shared the rivalry between the Anglican and Puritan groups. His deepest interest, however, was in literature and learning. He distinguished himself in Latin poetry, writing Ovidian elegies and other imitations, including a poem in hexameters on the Gunpowder Plot, and in the academic orations which were the test of proficiency in rhetoric and logic. In one of these orations he breaks off his Latin to deliver himself of an apostrophe to his mother tongue written in English couplets, and to declare his intention of composing an epic poem on some lofty theme. At about the same time, in 1628, he wrote an English elegy on the death of his sister's child. These two compositions definitely mark the beginning of his career as an English poet. The great ode *On the Morning of Christ's Nativity* followed in December 1629. In an epistle to Charles Diodati, *Elegy VI*, written at the same time, he declares that he is done with lighter themes and intends henceforth to devote himself to the heroic muse.

Milton continued at the university for three years after taking his B.A. in March 1624, and received his M.A. in July 1632, still intending, so far as we know, to enter the church. The literary work of this period includes the lines on William Shakespeare prefixed to the Second Folio, two humorous epitaphs in octosyllabic couplets on the death of the marchioness of Winchester, and perhaps the famous companion lyrics, *L'Allegro* and *Il Penseroso* (qq.v.). Nothing in this late university writing matches the *Nativity* in high Miltonic seriousness, but the poetry exhibits increasing versatility and skill. There are evidently various literary influences at work in Milton, notably that of the Spenserian school represented by Giles and Phineas Fletcher and that of the more classical Ben Jonson. He was already deeply interested also in Italian poetry and had written a group of sonnets in imitation of Petrarch. There is a strong erotic vein in Milton's poetry written before *Elegy VI* and the *Nativity* ode. According to his own account, enthusiasm for the sensual Romans gave way to an appreciation of the idealism of Dante, Petrarch, and Edmund Spenser, then to an interest in the Platonic philosophy of love in the *Symposium*, and finally to the religious ecstasy of the mystic marriage in the Book of Revelation. To what extent the record of his own affairs of the heart in the elegies and Italian sonnets is autobiographical must remain a question.

Residence at Horton.—On his graduation from Cambridge, Milton went into residence at his father's recently acquired house in Horton, Buckinghamshire, and remained there for almost six years. The reasons for his doing this are given in a letter to an anonymous friend who had expostulated with him about the apparent idleness of his way of life. He says that it is not mere love of study which kept him from entering upon the active duties of life, but the desire to be better prepared for them. He speaks as if he were still intending to enter the church, and he confesses that he has noted a certain belatedness in his own development. The conscientious earnestness of his attitude is confirmed by a sonnet written apparently on his twenty-fourth birthday and expressive of his sense of a lack of inward ripeness and of his acceptance of God's will concerning the seasons

of his service. At some time during the Horton period he must have definitely given up the church as a career. A Latin epistle to his father, written probably somewhat later than the sonnet, implies that his dedication is to poetry. It is an expression of gratitude for the indulgence which has thus far been accorded him and a plea for its continuance. The elder Milton was by this time retired from business. The poet says he is but following his father's example in his devotion to the arts. In commenting later on his decision, Milton says that to enter the establishment was to subscribe himself slave, and he speaks of himself as being "church-outed by the prelates." William Laud had been made archbishop of Canterbury in 1633 and was rigorously enforcing conformity on the clergy. That Milton's sympathies were strongly on the side of men like Young is evident. He was in the process of working out for himself another kind of ministry, the nature of which remained to be defined by circumstances.

Milton's actual occupations during this period of studious leisure are pretty well established. He devoted himself, he tells us, to the study of Greek and Latin authors, visiting London occasionally to buy books or to learn something new in music or mathematics. Volumes which have survived from his library contain elaborate and minute scholarly annotations of classical texts, as if he were preparing editions of these authors. A notebook of his readings shows that he pursued a systematic course of historical study from the downfall of the Roman Empire to modern times. The emphasis on ecclesiastical history and the church fathers suggests that he was concerned with the religious issues of the time.

While engaged in these serious studies, with whatever end or ends in view, Milton continued to write English poetry as he had done in his later college years. The two masterpieces of his youthful art, *Comus* and *Lycidas* (qq.v.), were written in the years 1634 and 1637, respectively. The first of these pieces is a masque, composed for performance at the inauguration of John Egerton, 1st earl of Bridgewater, as lord president of Wales. This nobleman's step-mother, the countess dowager of Derby, had her estate at Harefield only a few miles from Milton's residence. Both her family and her stepson's were patrons of the musician Henry Lawes, and it was doubtless at his suggestion that the poet was invited to supply the text for an entertainment of which he himself was the producer. An earlier experiment in this collaboration was *Arcades*, a pastoral presentation acted by members of the countess' household. *Comus*, a much more elaborate affair, was performed at Ludlow Castle, the principal parts being taken by Lawes himself and three of the earl's children, Lord Brackley, Lady Alice, and Thomas Egerton. It is not known whether Milton himself was present, nor can we be sure how close a social relationship he may have had with these great families. The masque, besides being a work of delicacy and charm, contains Milton's most serious moral and religious convictions and is everywhere stamped with his personality. The theme is the security of the virtuous mind under divine protection against all the powers of evil. More specifically, it is the virtue of chastity. There was nothing surprising in any poet taking this for a motif, but biographers and critics have attached special and personal significance to it

in the case of Milton. They remember that he was called the Lady at Christ's College and was later said to have been thought prudish by his acquaintances in Italy. There is data also regarding Milton's ascetic inclinations and ideals in both the poetry and the prose: *Elegy VI*, for example, and the long personal defense in the *Apology for Smectymnus* against Bishop Joseph Hall's charge of immorality. The interpretation of such material in its relation to Milton's personality is always open to question, and the suggestion that too much has been made of it is worth pondering. What is very clear and certain is that Milton's convictions regarding love and purity were both strong and individual, and that he found the interfusion of Christian and Platonic ideas which characterizes the philosophy of *Comus* an inspiring theme of poetic eloquence.

There is apparently a gap in Milton's literary activity between *Comus* and *Lycidas*, the last published work of the Horton period. This elegy, by general agreement the finest in the English language, was prompted by the death of a college classmate, Edward King, in whose memory an anthology of tributes, including Milton's poem, appeared in 1638. The author makes the cutting off of one who was both a fellow of the college and a brother poet the occasion for a seemingly very personal meditation on fate, fame, and immortality, as well as for the expression of tenderness and sorrow. An invective against the corrupt clergy, prompted by King's clerical status or perhaps by Milton's own decision against taking orders, is the poet's first great utterance of this kind.

Continental Travel.—Milton's mother died in 1637, and his brother Christopher, now married and a lawyer, settled with his new wife at Horton. In the following April the poet left England for a year and three months of foreign travel. The experience, though brief, was ever memorable to him. He went rather as a mature man of letters than as a pupil, seeking contact with outstanding personalities in the international community of scholars and actually participating in the intellectual and cultural activities of which they were the leaders. His itinerary led him first to Paris, where he was introduced by the English ambassador to Hugo Grotius, the great Dutch jurist and statesman, and then to Florence, where he was at once accepted by a congenial group of scholars, writers, poets, and patrons of the arts, most of whom were members of the *Accademia degli Svogliati*, one of the numerous cultural organizations which flourished in Italy at that time. On two occasions, Milton was invited to read poems at meetings of this organization, and with one of its younger members, Carlo Roberto Dati, he formed a lasting friendship. The dramatic episode of the Florentine visit was an interview with Galileo, then confined to his house by order of the Inquisition and much restricted in his intercourse, particularly with foreigners. Milton himself mentions this episode in *Areopagitica*, but for some reason omits it in his detailed account of the Italian journey in the *Defensio Secunda*. There are references to Galileo's telescope in *Paradise Lost*, and Milton shows acquaintance with the new system of astronomy, though he taught the old in his school and used it as the cosmological basis of his epic.

After two months in Florence, Milton went

on south to Rome and thence to Naples, where he was entertained by a well-known patron of letters, Giambattista Manso, whose distinction and hospitality he celebrated in a Latin poem. This and some epigrams in praise of the Italian singer Leonora Baroni are the only compositions known to have been written during the period of foreign travel. In Naples he received news from home which interrupted his plan for going on to Sicily and Greece. "I thought it base to be travelling for amusement abroad," he wrote afterward, "while my fellow citizens were fighting for liberty at home."

Journeying northward, he stopped again at Rome, this time to make the acquaintance of the papal librarian, Lukas Holste, and through his influence that also of Francesco Cardinal Barberini, in whose palace he attended a brilliant operatic performance. After a second stay of two months at Florence and one month in Venice, he crossed the Alps to Geneva, where he was entertained in the house of Giovanni Diodati (uncle of Charles), one of the most distinguished Calvinist theologians of the day. He arrived in England in the summer of 1639, amidst the turmoil of Charles I's efforts to force obedience on the Covenanting Scots and a little over a year before the king was compelled to summon the Long Parliament. At some time during his absence, Milton had learned of the death of his friend Charles Diodati; he commemorated this event after his return in a beautiful Latin elegy, *Epitaphium Damonis*, similar in form to *Lycidas* but more concretely personal. Milton had already in the poem on Manso spoken of his plan of writing an epic on the legendary history of Britain culminating in the reign of Arthur. Now in the *Epitaphium* he says that he has begun such a poem but found his pastoral style inadequate for its requirements. A set of manuscript notes, drawn up within a year or so after his return to England, shows that the subject of the fall of man, now conceived as a drama, was beginning to claim his interest.

Teaching and Public Affairs.—Milton had already embarked on activities which were to carry him far from poetry for many years. Taking a house in London, he set up a school with his two nephews, Edward and John Phillips, and a few others as pupils, and at the same time began to contribute pamphlets to the great controversy which was then raging over the abolition of episcopacy. Between May 1641 and April 1642, he published five tracts against the bishops and in favor of the Presbyterian system. The first and fourth of these, *Of Reformation Touching Church-Discipline in England* and *The Reason of Church Government Urg'd Against Prelaty*, are the longest and the most weighty. The last, *An Apology Against a Pamphlet Call'd a Modest Confutation of the Animadversions upon the Remonstrant Against Smectymnus* (*Apology for Smectymnus*), was written after a personal attack by Bishop Hall, a defender of episcopacy, whom Milton himself had ridiculed in the third tract, *Animadversions upon the Remonstrants Defence, Against Smectymnus*. The controversy became highly vituperative on both sides.

At the conclusion of this controversy, in the spring of 1642, Milton married Mary, the 17-year-old daughter of Sir Richard Powell, an Oxfordshire squire of Royalist sympathies who was in debt to the poet's family. The disparity

of age, politics, and probably of temperament and education was not the best basis for a happy marriage, and there was almost immediate trouble. Mary sought relief from the sobriety of Milton's household by returning to her parents for a visit and staying beyond her appointed time. War had already broken out, and Oxford had become a royal camp. What complications there may have been in the situation we do not know, but the story of the early biographers is that Milton was very angry at what he interpreted as desertion and began to pay court to another woman. A new outburst of pamphlet writing followed on the subject of divorce. Without alluding in any specific way to his own case, Milton attacks the canon law which admitted divorce only for adultery, setting forth a spiritual ideal of marriage and insisting, with much use of scriptural and other authority, that incompatibility, because it defeats these higher ends, should be admitted as a sufficient ground.

This crusade against the law of divorce, unlike Milton's earlier campaign against episcopacy, was a purely individual affair, but he carried it on with even greater energy. *The Doctrine and Discipline of Divorce*, originally issued in 1643, was amplified the next year to a length almost twice as great as any of the ecclesiastical pamphlets. Three other pamphlets on the subject followed: *The Judgement of Martin Bucer, Concerning Divorce* in 1644, and *Tetrachordon and Colasterion*, a reply to an anonymous writer who had taken issue with the first tract, in 1645. In maintaining the doctrine of divorce, Milton had written himself heretic from the point of view of the Presbyterians whose cause he had defended. He was indignant at the opposition which arose against him and from now on his role was that of an Independent, combating the new tyranny which was endeavoring to maintain its hold on the affairs of church and state. The passing of a licensing law by Parliament in 1643 was to him a reactionary step, threatening the very liberty for which the English people had engaged in battle with their king, and Milton paused in the middle of the divorce argument to write *Areopagitica* (published November 1644, q.v.) in defense of freedom of the press. This eloquent oration is the most notable of his prose works, or at least the one which best represents his moral and political philosophy to the modern mind. Though it fell on deaf ears in its own time, the arguments have proved to be of perennial validity, and the work is universally regarded as one of the great charters of democratic thought. In 1644 also he published a treatise in the form of a letter to Samuel Hartlib setting forth a very thorough and liberal program of humanistic education.

After the publication of the last divorce tracts, Milton desisted from pamphlet writing for nearly four years. His wife returned to him in the summer of 1645, and his eldest daughter, Anne, was born a year later. With the surrender of Oxford to the forces of Parliament in 1646, the Powell family took refuge for a time in Milton's household. On the death of his father in 1647, the poet gave up his school and moved to a smaller house. A second child, Mary, was born in 1648. His intellectual activity in this period included work on a history of Britain which remained unpublished until 1670. The publication of his

poems in 1645 and the writing of a half dozen sonnets, together with a series of Psalm translations, in the three years following suggest a renewal of his creative interests.

Commonwealth Service.—The trial and execution of Charles I in 1649 brought Milton again into action as a publicist and is a major turning point in his career. Before the judgment was delivered, he wrote *The Tenure of Kings and Magistrates*, maintaining the theoretical right of the people to bring their governors to account and, after due trial, to depose and even to execute a monarch who has become a tyrant. The exercise of this right belongs, he declares, "to any who have the power." The treatise is therefore a justification of extralegal revolution. Milton does not deal directly with the case of Charles, but in one passage inveighs against the Presbyterians, who, having taken arms against the king, now protest against the talk of bringing him to justice. The pamphlet was published in February 1649, just after the execution. As an immediate result, Milton was appointed Latin secretary (secretary for foreign tongues) to the Council of State, an office which he was to continue to exercise until the Restoration. The regular duties of this office consisted in drafting the foreign correspondence, translating, and communicating in person with envoys, but Milton was expected also to defend the new regime by propaganda. Thus he prepared and published *Eikonoklastes*, the first of a new series of prose works, on order of the council within seven months after his appointment. This was a severe indictment of the personality and career of Charles I in answer to *Eikon Basilike* (q.v.), a work of powerful appeal to popular feeling purporting to have been written by the king's own hand.

The next year saw the beginning of the greatest literary battle of Milton's career. Again by order, he undertook to answer the French scholar Claudius Salmasius (Claude de Saumaise), who had become the official spokesman of the royal cause on the Continent. *Pro Populo Anglicano Defensio Contra Claudii Anonymi, Alias Salmasii Defensionem Regiam* appeared early in 1651, addressing itself to the court of learned opinion throughout Europe and containing, besides the already familiar political arguments of *The Tenure of Kings and Magistrates* and *Eikonoklastes*, a wealth of personal abuse of his opponent. Salmasius, discredited and disgraced, as rumor had it, by Milton's scathing treatment of his work and character, retired temporarily from the arena, but his cause was vigorously taken up in Peter du Moulin's *Regii Sanguinis Clamor ad Coelum Adversus Parricidas Anglicanos* (1652), in which Milton himself is made a victim.

The poet's answer to this work was delayed nearly two years, perhaps by a series of crises in his own life. A third child and only son, named John, was born to him in 1651, but died within a few months. A year later, Mary Powell herself died, three days after giving birth to a third daughter, Deborah. Milton was thus left alone with three young children. He was, moreover, burdened at this time by sickness and by increasing trouble with his eyes. His sight had been failing for some time, and he had been warned by his physicians of the danger of continuing to work on the first *Defensio*. Blindness became complete early in 1652. In December of that year, he speaks in a letter of "what is now an

almost perpetual enemy of mine, ill health." Further evidence of relative incapacity is afforded by his increasing absences from council meetings, by the appointment of an assistant to him in office, and a little later (1655) by the reduction of his salary and further relief from responsibility. By this time, however, Milton had apparently recovered much of his energy. He published the monumental *Pro Populo Anglicano Defensio Secunda* in May 1654, castigating the personality of Alexander More, whom he supposed to be the author of the *Clamor*, setting forth the ideals which had governed his own career and paying noble tribute to the great leaders of the revolution. He had celebrated Oliver Cromwell and Sir Henry Vane in sonnets written in 1652, and there is a new outburst of utterance in this form in 1655, notably the sonnet on the massacre of the Waldenses in Piedmont and one at least of the two sonnets on his blindness, in which Milton speaks of his personal tragedy with noble pride and resolution. A long personal statement in the *Defensio Secunda* reveals his thought and feeling on this subject even more deeply. He was convinced that his great affliction was not, as his enemies had intimated, a judgment of God against him, but rather a trial of faith—something which set him apart from other men and entitled him to special favor from on high. In taking away his outward sight, God had vouchsafed him an inner illumination of the spirit. It was his duty to cherish this gift by spiritual communion with the divine and at the same time to persevere in the daily tasks appointed him.

Though his great day as the defender of English liberty was now over, he continued to carry on foreign correspondence in Cromwell's name throughout the protectorate and, as we shall see, to rally his forces for further controversial writing in the moment of defeat.

The true inwardness of Milton's domestic life in this period is something we really know very little about. He was not friendly with his mother-in-law, to whom he might naturally have turned for assistance with the children after Mary's death. There is little evidence of intimacy with his brother Christopher, who was now in London trying to make composition as a Royalist for his sequestered estate. On the other hand, Milton was rich in devoted friends and felt very warmly towards them. His greatest intimacy was with Cyriac Skinner, a former pupil to whom two of the sonnets of 1655 are addressed.

On Nov. 12, 1656, Milton contracted a second marriage, with Katherine Woodcock, who lived only a year and four months, giving birth to a daughter on Oct. 19, 1657, and dying, with the child, early in the following winter. It is generally believed, though positive evidence is wanting, that the beautiful sonnet to his deceased wife which stands last in the series of sonnets in the Trinity manuscript and in the published poems was addressed to her, and on the basis of this description rests the assumption that this marriage was romantically happy. According to the authority of Edward Phillips and Aubrey, Milton again took up work on *Paradise Lost* at about this time (1658). He had now decided that the material could best be handled in epic form. How far he proceeded with it while still occupied in the secretaryship is a matter of conjecture.

With the death of Oliver Cromwell in 1658, Milton again undertook to exert an influence on politics by addressing himself to Parliament in

behalf of religious liberty. *A Treatise of Civil Power in Ecclesiastical Causes*, holding that it is unlawful for a magistrate to enforce conformity of belief, and *Considerations Touching the Likeliest Means to Remove Hirelings out of the Church*, advocating a voluntary and unpaid clergy, appeared in 1659. Finally, in 1660, amidst the political confusion of the last days of the Puritan regime, he drafted a plan of republican government in *The Ready and Easy Way to Establish a Free Commonwealth*, proposing the establishment of a self-perpetuating Parliament and protesting with all his eloquence against the movement, now inevitable, toward the restoration of the house of Stuart. A month after the appearance of a second edition of the work, Charles II landed in England, and Milton's public career was at an end.

Post-Restoration Period.—The effects of the Restoration on Milton's personal fortunes, as well as his hopes for England, were little short of ruinous. Losing not only his salary of £200 a year, but a considerable investment in government securities, he became almost overnight a relatively poor man. More than that, he was henceforth the relic of a treasonable cause, which every possible means was employed to discredit and root out. Many of the men with whom he had been most closely associated were exiled or put to death, and Milton's name, so far as he was noticed publicly at all, was mentioned only with execration. Except for a brief imprisonment and the burning of *Eikonklastes* and the first *Defensio*, he himself escaped punishment. He lived quietly and simply thereafter, industriously engaged in literary work of many kinds, but finding his deepest satisfaction in his devotion to poetry. His own activity in the composition of *Paradise Lost* was essentially religious. The muse who inspired him was none other than the spirit of the Almighty, and his meditations on the truth revealed to him by Scripture were a continuous prayer.

In February 1663, he married for the third time, his bride, Elizabeth Minshull, being but 24 years old. She evidently proved a good wife to him and lived to cherish his memory and to report to John Aubrey many details of his later life. The daughters of his first marriage, at least the two elder ones, seem to have been unfriendly. Milton is described by Phillips as trying without success to make them read and write for him in languages which they did not understand and finally apprenticing them to the trade of lace-making. There was a controversy after Milton's death between the children of his first marriage and his widow respecting his property. The poet's brother and a former maidservant testified to the effect that the girls had exhibited great hostility to their father and that he had intended to disinherit them. Though the picture may be somewhat overdrawn, there can be little doubt that relations were strained, particularly after the third marriage. The youngest daughter, Deborah, nevertheless professed great affection for her father when she was interviewed about him in the 18th century, and he may have had satisfaction in her society in his later years. Anne, the eldest daughter, was a cripple and whether for this or some other reason was, according to Phillips, excused from service as an amanuensis. The other two were 12 and 8 years old, respectively, at the Restoration and may have come to be of some assistance before they left the household.

In this last period of his life, Milton, after changing residences many times, was finally established in a house near Bunhill Fields on the eastern edge of London. He corresponded with foreign scholars and continued to enjoy the friendship of such old associates as Andrew Marvell, and from time to time exchanged instruction with young men for the literary assistance he so sorely needed. In this respect, his chief dependence was probably on the elder of his two nephews, Edward Phillips, who became his literary executor.

Paradise Lost was completed about 1665 and published two years later by Samuel Simmons. The original contract, which still exists, provided for a payment of £5 down and a second £5 when the first impression of 1,500 copies should have been sold. This second payment was made in 1669. All rights to the poem were ultimately sold by Milton's widow for £8. In its final form as an epic, *Paradise Lost* is cosmological in its scope, an epic of creation and the wonders of the universe, as well as of the fall and the regeneration of mankind. In this respect, it has much in common with the type of Biblical paraphrase known as hexameron, which takes the first chapter of Genesis and Scripture generally as a basis for the exposition of scientific and philosophical lore of every sort. The most popular work of this kind in England was the translation of a Huguenot poem, *La Semaine*, by Guillaume de Salluste, seigneur du Bartas. Milton had been familiar with this from youth and was undoubtedly much influenced by it. His version of the world system is, however, both more artistic and more individual than its English predecessor. Many years of study and meditation had gone into it, and it reflects the whole of its author's experience of life. In the invocations, Milton speaks of his long devotion to the subject, of the difficulties imposed upon him by his loss of sight, and of the assurance given him by the divine spirit whose aid he implores. Other less tangible biographical elements have been found in the poem, particularly in the portrayal of the relations of Adam and Eve, and Milton's psychological attitudes with reference to his imaginative projection have been complexly explored. There is, however, no agreement in such matters. Reflections of his politics, on the other hand, as in his reading of the history of the Christian Church, are obvious enough. Theologically, Milton rejected the Calvinistic view of predestination and the dogma of the Trinity in its orthodox form. His anti-Trinitarian position, set forth explicitly elsewhere, is obscured in *Paradise Lost*, and the doctrine of the poem has been generally acceptable to Protestant readers. (See also *PARADISE LOST*.)

Milton's last two poetical works appeared in 1671 in a single volume bearing the title *Paradise Regain'd. A Poem. In II' Books. To Which is added Samson Agonistes*. No positive evidence of the date of their composition is available. The natural inference that *Paradise Regain'd*, being as it is a kind of sequel to *Paradise Lost*, would have followed it immediately, is supported by Thomas Ellwood's account of the part which he himself played in suggesting it. The story of Milton's acquaintance with this Quaker boy is famous in literary history and deserves special notice as giving the only intimate view we have of the poet in the moment of fulfillment of his most cherished literary hopes. Ellwood had sought Milton's instruction in 1662 and been admitted through the mediation of Dr. Nathan

Paget "not as a servant, which at that time he needed not, nor to be in the house with him, but only to have the liberty of coming to his house at certain hours when I would and to read to him what books he should appoint me." As commonly happened with Milton and his pupils, the two became warm friends. In the summer of 1665, when the poet was living at Chalfont St. Giles to escape the plague, Ellwood was allowed to read the manuscript of *Paradise Lost*, returning it with the remark: "Thou hast said much of *Paradise lost*, but what hast thou to say of *Paradise found*?" When the new poem was handed him at some later time in London, Ellwood reports Milton as declaring: "This is owing to you; for you put it in my head by the question you put to me at Chalfont, which before I had not thought of." It would appear from this plausible account by a person of unquestionable veracity that Milton went on immediately from the poem of highest inspiration and hardest achievement, which had been meditated for so many years, to one which was an afterthought. *Paradise Regain'd* is, indeed, a beautiful and serene work by no means unworthy of its author, but in one sense it is little more than an amplification of a theme already incorporated in the other. Milton is prolonging the kind of poetic meditation represented in the more didactic passages of the earlier work, and his imagination is much less deeply engaged. (See also *PARADISE REGAIN'D*.)

The origin and significance of *Samson Agonistes* (q.v.) is something different. The common view is that it represents a new and final creative moment in Milton's poetic history and is, like *Paradise Lost* itself, the fulfillment of a long-cherished purpose. Subjects from the life of Samson had been included in the early literary plans for tragedies, and the Hebrew champion had come to be for Milton an important symbol. His own blindness and the failure of his cause, together with his abiding faith in God's ultimate triumph, make it difficult for us to dissociate his treatment of the Biblical story from his personal experience. The analogy, of course, is not complete. Samson's weaknesses are those of England rather than of Milton himself, and his great vindication represents something which the poet could hardly expect to witness. Whatever its validity as a biographical document, *Samson Agonistes* is a work of great imaginative intensity, and if it was actually written after *Paradise Regain'd* it shows that Milton's poetic powers were still undiminished.

Last Years.—In the years which remained to him after the composition of his major poems, Milton continued busy with a variety of literary tasks. He published his *History of Britain* in 1670, an early work on logic in 1672, a second edition of the minor poems with the addition of earlier and later lyrics in 1673, and a volume of his college exercises and Latin letters and the second edition of *Paradise Lost* in 12 books in 1674. He was at work also on a Latin dictionary and on the final revision of a great theological manuscript which remained unpublished until the 19th century.

More surprising than any of these evidences of the persistence of Milton's energies and purposes is his return at this eleventh hour to his old role as a publicist. He did so in a pamphlet entitled *Of True Religion, Heresy, Schism, Toleration, and What Best Means May Be Used*

Against the Growth of Popery, which appeared in 1673 amid the storm of popular opposition to Charles II's efforts to secure favor for the English Roman Catholics. Its announced purpose was to lend a hand to the efforts of those who, alarmed at the growth of Catholicism, were exhorting the public to "beware the growth of this Popish weed." The proposition is that Catholicism, "false religion," can be stopped only by true religion and that, in rallying their forces to oppose the common enemy, Protestants must need tolerate each other. The essential thing is not that the sects should hold the same beliefs but that they should jointly have the moral force to regenerate a people which had fallen into the bondage of sin, and was not unlikely as a consequence to lose even the remaining vestiges of its liberty.

Milton died of gout in 1674 and was buried in St. Giles, Cripplegate, beside his father. Had he lived long enough to witness the outcome of the new struggle against the Stuart autocracy, he would have seen his name restored to honor as a party hero. His real work had, however, been accomplished in another form. He once said that in prose he had the use, as it were, only of his left hand. It is fortunate for mankind that enforced retirement from the heat and dust of politics enabled him to fulfill the aspiration of his early life by leaving something so written to later times that they would not willingly let it die. Yet the greater achievement includes the lesser. Milton believed that he who would speak worthily of worthy things must himself be a man of lofty virtue. He could not have written the great poems without having done what he conceived to be his duty as a servant of the will of God. What that duty was he never doubted, and this is at once his weakness and his strength. Though he was a man of singular urbanity and charm, not lacking even in a sense of humor, there were in him elements of harshness and egocentricity which have not been spared by some biographers. On the other hand, he exemplified the moral discipline and the spiritual elevation of the Puritan character in so enlightened and humane a form that many admirers are loath to admit even his obvious imperfections.

Bibliography.—The accounts of Milton by Edward Phillips, John Aubrey, and other near contemporaries may be read in Helen Darbishire's *Early Lives of Milton* (London 1932). Joseph Milton French's *Life Records of John Milton*, vols. 1-3 (New Brunswick, N.J., 1949-54) gives the documentary material in great detail. David Masson's *Life of John Milton*, 6 vols. (London 1859-94), though out of date in some respects, is still the great authority for all aspects of Milton's career. A variorum edition of the poems is in preparation by members of the Modern Language Association, and an annotated edition of the prose, *Complete Prose Works* (New Haven 1953-), is being published by the Yale University Press. The Columbia edition of *The Works of John Milton*, 20 vols. (New York 1931-40) is the only complete collection of both the poetry and the prose of Milton.

JAMES H. HANFORD,
Author, "John Milton, Englishman."

MILTON, town, Florida, seat of Santa Rosa County; on the Blackwater River, 18 miles northeast of Pensacola. Founded about 1825, it is a lumbering center. Pop. (1950) 2,042.

MILTON, town, Mass., Norfolk County, 6 miles south of Boston, on the Neponset River and the New York, New Haven and Hartford Railroad. It manufactures chocolate, crackers, and metal products and has an engraving plant. Part of the Blue Hills belongs to Milton. On

Great Blue Hill (625 feet) fires were kindled on the news of the repeal of the Stamp Act; of the adoption of the Declaration of Independence; and on the surrender of Gen. John Burgoyne and Gen. Charles Cornwallis. Beacon fires burned here during the Revolutionary War. At an early date an observatory for tourists was erected on Great Blue Hill and in 1885 the Blue Hill Observatory for meteorological investigations was established by Abbott Lawrence Rotch (1861), who made important investigations regarding clouds. Milton Academy was founded in 1798 and a public library was opened in 1871. Milton owns two granite quarries and two public parks: Cunningham Park and Hutchinson Field, the latter on a portion of the estate of Thomas Hutchinson, a colonial governor of Massachusetts.

Milton was settled in 1640. It was originally a part of Dorchester and was called Uncataquisset. The town was separated in 1662 and incorporated. It owes its name either to Milton Abbey, Dorset, from which members of the Tucker family emigrated, or to the number of mills established here—Mill Town. It was the residence of two colonial governors—Jonathan Belcher and Thomas Hutchinson. In 1712 the Blue Hill lands were divided between Milton and Braintree. In 1868 part of Milton was given to the new township of Hyde Park. Milton now includes the village of East Milton and Milton Lower Mills. Milton was brought into political importance during the early days of the Revolution by the passage of the famous "Suffolk Resolves." These bold resolutions were passed on Sept. 9, 1774, at a meeting of the citizens held in the house of Daniel Vose, these men having adjourned from Dedham. The "Suffolk Resolves" declared that a sovereign who breaks his contract with his subjects forfeits their allegiance; that the repressive measures of Parliament were unconstitutional; that tax collectors should not pay over money to the royal treasury; that the towns should choose public officers from the patriot party; that they would obey the Continental Congress; that they favored a provincial congress; that they would seize Crown officers as hostages for any political prisoners arrested by the governor; and they recommended that all persons in the colony should abstain from lawlessness. Pop. (1950) 22,395.

MILTON, now **MILTON WEST**, town, Ontario Province, Canada, capital of Halton County, is located 29 miles southwest of Toronto, on the Canadian Pacific and Canadian National railways. Its manufactures include lumber, flour, butter, pressed brick, crushed stone and lime, screws, rivets, and rugs. There is also a spinning mill which makes sweaters, socks, and other knit goods. The town has two parks, waterworks and electric lighting. Pop. (1951) 2,451.

MILTON, borough, Pa., Northumberland County, is located on the West Branch of the Susquehanna River, the Pennsylvania and the Reading railroads, 11 miles northeast of Sunbury. Products of its industrial plants are railroad tank cars, bolts and bars, nails and nuts, hosiery, chemicals, food products, shirts, silk, and wooden articles. The old Pennsylvania Canal ran past the town. Milton was partly destroyed by fire in 1880. The town is four miles from Bucknell University, at Lewisburg. Settled shortly after

the Revolutionary War, Milton was incorporated in 1817. In 1890 it received a revised charter. A burgess and borough council administer the government. Pop. (1950) 8,578.

MILTON, village, Wisconsin, Rock County, altitude 877 feet, 8 miles northeast of Janesville, on the Chicago, Milwaukee, St. Paul and Pacific Railroad. It is in a grain-growing district, and has manufactures of electrical medical equipment. It is the seat of Milton College (q.v.). Pop. (1950) 1,549.

MILTON COLLEGE, Milton, Wis., a co-educational institution, was founded in 1844 by pioneers from Eastern states, most of whom were Seventh-Day Baptists. It was first known as Du Lac Academy; in 1848 it became incorporated; in 1854 the name was changed to Milton Academy; and in 1867 it received its charter as a college. The influence of Milton College is Christian rather than sectarian, although it has always maintained a closely sympathetic relation to the Seventh-Day Baptist people. It is strictly a college of liberal arts, granting the bachelor of arts and bachelor of philosophy degrees only. Graduates are admitted to the graduate school of the University of Wisconsin. Chapel attendance is compulsory. The institution has the usual arts and science departments, and occupies five buildings. In 1952 the enrollment was 288 students.

MILVIAN, mil'vī-ān, **BRIDGE**, ancient bridge over the Tiber at Rome built in 109 B.C. by Marcus Aemilius Scaurus on the famous Flaminian Way. Here Cicero had the ambassadors of the Allobroges arrested (60 B.C.) who were conspiring with Catiline; and here Maxentius was drowned after his defeat by Constantine (312 A.D.). The modern Ponte Molle now spans the Tiber in place of the Milvian Bridge.

MILWAUKEE, mil-wó'kê, Wisconsin, metropolis of the state, seat of Milwaukee County; located on the west shore of Lake Michigan 88 miles north of Chicago, at the confluence of the Milwaukee, Menomonee, and Kinnickinnic rivers. Milwaukee is one of the most important Great Lakes ports and one of the world's chief centers for heavy machinery production. It is the thirteenth largest city in the nation (1950 census) and ranked eighth in the value of its manufacturing in the 1947 Census of Manufactures.

Geography.—The city has (1950) an area of 50.4 square miles. Roughly crescent shaped, it is bounded on the east by a beautiful bay six miles wide. The Milwaukee River winds in from the north, roughly paralleling the curve of the bay, and is joined by the Menomonee flowing from the west and the Kinnickinnic from the southwest, just before entering the bay. The bay is outlined a short distance inland by bluffs varying in elevation from 85 feet to nearly 150 feet above Lake Michigan. Bold and steep at the north and south headlands, these bluffs have been modified in the thickly settled heart of the city to slopes gradually descending toward the level of the rivers. The bottom lands along the river valleys and lakeshore delta were, in early days, mainly tamarack swamps and marshes abounding in wild rice. Leveling and filling for building purposes and street grading have converted them to "made land" on which stands much of the business district. On gently rolling higher land between the

river valleys to the north, west, and south are extensive and unusually attractive residential areas. Some of the finest homes are found, however, in the residential suburbs of Shorewood, Whitefish Bay, Fox Point, and River Hills along the lakeshore to the north, and in Wauwatosa to the west. West Allis, Cudahy, and South Milwaukee are industrial satellite cities to the southwest and south. Milwaukee's average altitude above sea level is 581.22 feet. The proximity to the lakeshore modifies the climate, reducing extremes of temperature. The mean average monthly temperature (1870-1949) ranged from 21.2 degrees in the coldest month (January) to 70.7 in the warmest (July). The average annual precipitation over the same period was 30.16 inches. The snowfall (unmelted) averaged 45.3 inches per year.

Population.—In 1950, the decennial census showed Milwaukee to have a population of 637,392. This represented a considerable growth over the 1940 census figure of 587,472. A local enumeration in 1838 gave the village of Milwaukee 700 residents, and the 1840 census showed 1,712 persons living there. When the city was incorporated in 1846, there were 9,666 residents. The 1900 census showed a phenomenal growth to 285,315 persons, and in the next half century this figure was more than doubled. In the mid-19th century, German immigrants came to Milwaukee in great numbers, giving a distinct Teutonic flavor to the city's culture and institutions and earning it the sobriquet, The German Athens of America. The later decades of the century brought a large immigration from Poland, Austria, Scandinavia, Russia, and Italy, but the Germans remained the leading foreign group. There has been comparatively little immigration since 1920, however, and by the 1940 census Milwaukee had a higher percentage (84.2) of native-born white persons than any city over 500,000 in the United States. Milwaukeeans have traditionally taken pride in home ownership and the beauty of their residential areas. Blighted sections are less extensive than in most other large cities. More than 43 per cent of families owned their own homes in 1950, and more than 80 per cent lived in single family or duplex dwellings. Milwaukee industries draw upon an extraordinarily large reservoir of skilled workers, and average income per family in the metropolitan area in 1948 was estimated at \$7,510 or nearly 50 per cent over the national average (Federal Reserve figures, 1948).

History.—Probably the first white man to visit the site of Milwaukee was Father Jacques Marquette (q.v.) who stopped at the mouth of the Milwaukee River Nov. 23, 1674, on his way south to visit the Illinois Indians. Marquette's name is memorialized in Marquette University at Milwaukee. In 1679, Father Zenobius Membré, a missionary with the exploratory party of René Robert Cavalier, Sieur de la Salle (q.v.), noted in his journal a visit to an Indian village "on the banks of the river called Melleoki." This is probably the first written record of Milwaukee's name, whose original meaning was "pleasant land." The next recorded visit is that of Father Jean François Buisson de Saint Cosme, on his way from Quebec to Illinois to found a mission, October 1699. "On the seventh," he wrote, "I arrived at Melwarik . . . a river where there is a village which . . . [is] inhabited by the Mascoutens, Foxes and . . . Pottawattamies." Captain Arent Schuyler de Peyster, British commander

at Michillimackinac, had a low opinion of the Milwaukee Indians, who were reluctant to help the British fight the Americans. He wrote in 1779 of "those runegates [renegades] at Milwaukee—a horrid set of refractory Indians." By the mid-18th century, Milwaukee was the occasional stopping place for several fur traders. One, St. Pierre, was living among the Indians there as early as 1764; and before 1800, other white men came as resident traders. Capt. Thomas Gummersal Anderson, who arrived at Milwaukee in 1803, noted that there was "quite a society of its kind" among the several traders residing at the mouth of the Milwaukee River. Solomon Juneau, a French Canadian usually regarded as the founder of Milwaukee, found only an Indian village when he arrived there in 1818 to operate a branch of Jacques Vieau's Green Bay trading post of the American Fur Co. Juneau built a cabin on the east side of the Milwaukee River, and in 1819 bought out Vieau and became the proprietor of the Milwaukee post. His cabin was the nucleus of a permanent settlement which became known as Juneautown. Byron Kilbourn, a New Englander, who arrived in 1834, started a settlement on the west side of the river, Kilbourn town; and George H. Walker, a Southerner, the same year founded Walker's Point, south of the Menomonee. The rivalry among the three settlements was keen, but on March 11, 1839, the village of Milwaukee was incorporated with Juneautown as the east ward and Kilbourn town as the west ward. Walker's Point was added as the south ward in 1845. Still the sectional rivalries smoldered, and in May 1845 flared up in the Bridge War in which several bridges joining the wards were demolished and armed mobs rioted, with some bloodshed but no fatalities. By 1846 differences had been compromised and on Jan. 31, 1846, Milwaukee was incorporated as a city. Juneau became the first mayor. The man who played the largest single role in the development of Milwaukee into a major city was probably Alexander Mitchell, a Scot who came to Milwaukee in 1839. He developed a pioneer bank, at a time when banking was unconstitutional in Wisconsin. The certificates of deposit of Mitchell's company were the soundest banknotes in the west in the mid-19th century. The bank later became a thriving state bank of which Mitchell was president and principal owner. Mitchell was also instrumental in the development of Wisconsin's railroads. He was a director of the Milwaukee & Waukesha Railroad, Wisconsin's first, which made its maiden run of 12 miles on Feb. 25, 1851. Before Mitchell's death and largely through his genius, this line grew into the important Chicago, Milwaukee & St. Paul. By 1869, Mitchell, president of both that road and the Chicago & Northwestern, was popularly known as "railroad king of the world." He later served his district as congressman. Descendants of Mitchell—John L., his son, and Gen. William (Billy) Lendrum Mitchell, his grandson, played important roles in later history.

During the first half of the 1800's, shipbuilding became one of Milwaukee's important industries and a Milwaukee-built ship carried a cargo of wheat directly from the port to Liverpool in 1856.

Like every other American city of the 1850's, Milwaukee was affected by the slavery problem. The reaction to the fugitive-slave law (q.v.) was sharp and when an escaped slave was caught in Wisconsin and held in a jail in Milwaukee in 1854,

Milwaukee citizens freed him and helped him into Canada. The Civil War stimulated Milwaukee's manufacturing industries and changed many of them from small shops that produced handmade goods to large factories with machine-made products. Two years after the war's end, Milwaukee's first labor union of national scope—the Knights of St. Crispin—was organized among the city's boot and shoe workers.

After the Civil War, Milwaukee became the greatest wheat market and wheat port in the nation, and a newspaper boasted: "Wheat is king and Wisconsin is the center of the empire!" Beer became Milwaukee's chief product in the late 1880's, but after the turn of the century, machinery and metal goods manufacture, meat packing, and leather products took the supremacy away from brewing. During the latter half of the 19th century the German flavor of Milwaukee's institutions was pronounced. German immigration had begun in 1838; by 1900, 72 per cent of the city's population was of German birth or descent. There were twice as many German language as English newspapers in the city, the German theater and orchestra flourished, and German singing and marching societies and *turnvereins* were numbered in the dozens. Beer gardens and coffee houses played a distinctive part in the city's social life. The anti-German feeling during World War I wiped out many surviving manifestations of Germanic tradition in the city. In 1910, the Socialists won control of Milwaukee's city government and elected the first Socialist mayor of any large American city. Another followed him in 1916 and held the office for 24 years. Under the Socialist mayors Milwaukee made an enviable record for good city government.

Government.—The city has a mayor-council form of government. The mayor, and an alderman elected from each ward, all serve four-year terms. The city wards are coextensive with the state assembly districts. The city attorney, treasurer, and comptroller are elective officers. The major appointive officers include the commissioners of public works, health, taxation, the fire and police chiefs, city engineer, and the building inspector. Milwaukee has long had a national reputation as a well-governed city because of the freedom from municipal corruption, its debt-free status, and exceptionally high records among large cities in health, fire prevention, traffic safety, and crime control. For 16 years prior to 1950, for example, Milwaukee had the lowest traffic death rate in the nation for cities of its class.

The city's reputation of being debt free stems from the creation in 1923 of an amortization fund to meet principal and interest charges on the city's outstanding general obligation bonds. A policy was also established of paying for permanent improvements by the accumulation of funds in advance. By 1944, the amortization fund equaled all city bonded debt; but since some of the bonds were not to mature until 1952, the city was not yet debt free in a literal sense. The city administration elected in 1948 departed from the pay-as-you-go plan in financing some permanent improvements, however. Exceptions were made for municipal housing projects built by the Milwaukee housing authority. These included Hillside Terrace, a 232-unit project completed in 1949 to eliminate a blighted area in a Negro district; and three veterans' housing projects, Northlawn and Southlawn, totaling 585 units (completed in 1949), and Berryland, 392 units (com-

pleted in 1950). Parklawn, an older housing project (1937) of more than 500 units and built by the federal government, is leased by the Milwaukee housing authority. The city owns a \$32,000,000 water works and purification plant, and a metropolitan sewerage commission created in 1921 operates a modern \$17,000,000 sewage disposal plant. By treating sewage by the activated sludge method this plant manufactures a commercial fertilizer, the sales of which return to the commission nearly \$2,000,000 yearly. A movement toward consolidation of civic units to increase efficiency and reduce overlapping of functions among the governments of the city, county, and 18 suburban communities, resulted in 1934 in the appointment of a joint committee on consolidation. In an advisory referendum that year, the citizens endorsed the principle by large majorities. Progress toward consolidation has been slow, however, and the most important step in that direction was the merger of the city and county park systems under the county park commission in 1937. The county institutions, on a 1,100-acre site west of the city, include a 1,000-bed general hospital, an infirmary, an asylum for the insane, a hospital for mental diseases, a home for dependent children, and a tuberculosis sanitarium. A county emergency hospital is centrally located in the city. The city operates another emergency hospital and an isolation hospital. The growth in the city's overall services since its incorporation in 1846 is indicated in the expansion of the municipal budget from approximately \$5,000 to more than \$65,000,000 in 1950. Despite the long tenure of Socialist mayors in Milwaukee (26 years prior to 1940), the public utilities have been left mainly to private enterprise. Thus, electric power, public transportation, and gas and telephone service are all privately owned. The Socialist influence in Milwaukee city government is often exaggerated. The Socialists held an actual majority in the common council only from 1910 to 1912, and the city's charter would not have permitted any thoroughgoing socialization even had the local lawmakers wanted it. In the writer's opinion, the Socialist influence made itself felt mainly in high standards of honesty and efficiency in performing the ordinary municipal functions.

Industry and Business.—Milwaukee's widely diversified manufacturing activities add nearly \$1,000,000,000 a year to the total value of its products, which in 1949 was an estimated \$1,800,000,000. In 1947 the Milwaukee industrial area, coextensive with the borders of Milwaukee County, had 1,963 manufacturing establishments employing 177,202 workers, according to the United States Census of Manufactures. More than a quarter of the output was in machinery (other than electrical), including engines, turbines, construction and mining equipment, machine tools, pumps and compressors. The next most important manufacturing category was food and kindred products, of which malt beverages made up almost half the total value. Electrical machines ranked next and, in descending order, were fabricated metal products (other than machinery); primary metal industries (mainly foundries); transportation equipment (mainly motor vehicles and parts); printing and publishing; and leather and leather goods. Milwaukee leads (1950) all other manufacturing centers in the world in the manufacture of Diesel engines, certain types of gasoline engines, and outboard

motors, motorcycles, tractors, wheelbarrows, and padlocks; it leads the nation in the production of silk hosiery, work shoes, leather gloves, tin and enamelware, and sawmill and flour mill equipment; it is the biggest veal-packing center and barley market, and the home of four of the nation's seven largest breweries. While Milwaukee's importance in manufacturing overshadows its commercial position, the retail sales in the Milwaukee area totaled \$921,300,000 in the 1948 federal census of business, and wholesale sales were \$1,417,000,000. The service trades accounted for another \$61,400,000. Employment in retail and wholesale sales and service trades was 84,064 workers.

Milwaukee inventors have contributed much to business and industrial development. Among them was Christopher Latham Sholes who, with the assistance of Samuel W. Soule and Carlos Glidden, patented in 1868 the first practical typewriter. Other Milwaukee inventors include Gottfried Schloemer and Frank Toepfer who built a gasoline automobile in 1889, claimed locally to have been the first in the United States; Ole Evinrude, inventor of the outboard motor; Niels A. Christensen, of a type of air brake generally used in 1950; and Edward A. Uehling, of a recording meter, a pig iron casting machine, and some 25 other widely used devices.

Transportation.—Milwaukee's excellent location (particularly its harbor) and its fine transportation facilities, have been major factors in the city's industrial and commercial growth. Milwaukee is not only a leading Great Lakes port, but an ocean port as well, served by ship lines operating directly between it and coastal ports of the Atlantic Ocean and Gulf of Mexico, and others in the Caribbean Sea, South America, Europe, and the Mediterranean Sea. More than 50 ship lines call (1950) at Milwaukee, including four plying between the United States and Europe. Milwaukee is the principal machinery export point on the Great Lakes, the second most important coal receiving port on Lake Michigan, and one of the largest grain shipping ports on the Great Lakes. Besides the excellent outer harbor, the three rivers emptying into the bay are all navigable by vessels of draft up to 22 feet; with their connecting canals and slips they provide about 23 miles of water front. The rivers are crossed by 31 bridges; those in the path of navigation are drawbridges which can be raised to permit passage of ships. The federal government has spent about \$7,000,000 in Milwaukee harbor improvements, mainly for four miles of breakwater, forming a 1,200-acre anchorage basin. The city harbor commission has spent about \$9,000,000 additional for port improvements, and operates open docks, a car ferry terminal, transit shed, mooring basin, and a lake front landing strip, Maitland Field. This unusual field, within 10 minutes' walk from the downtown business district, was the first of its kind in the United States when it was opened in 1927. It has a 2,900-foot hard surface runway, longest of any lake front landing strip on the Great Lakes. It is equipped to handle amphibian and seaplanes, as well as land planes. The harbor is considered the most beautiful on the Great lakes. A concrete breakwater protects it, together with its docks, lighthouses, and other installations.

Municipally-owned and private harbor facilities together include some 90 dock terminals of all types, serving as many as 6,000 ships in a

season. Coal furnishes the bulk of the cargo received at the port, and the other principal shipments are petroleum, building materials, iron and steel, grain, flour, feed, and package freight. The annual inbound and outbound cargo totaled (1940's) between 8,000,000 and 9,000,000 tons, with a value of approximately \$500,000,000. Milwaukee's harbor is equipped with large cranes for handling heavy machinery, and two car-ferry lines maintain year-round service, carrying railroad cars to and from ports on the east shore of Lake Michigan where they connect with several railroads. One steamship line operates passenger and freight steamers to Michigan ports practically throughout the year. Milwaukee is unique among Great Lake cities in having most of its lake shore area municipally owned. Areas not developed as harbor facilities have been made into scenic shore drives, public bathing beaches, and beautiful parks. The city is served by three major steam and Diesel railroads; the Chicago, Milwaukee, St. Paul & Pacific; the Chicago & North Western (q.q.v.), and the Minneapolis, St. Paul and Sault Ste. Marie. Electric lines serving the city and suburban areas are operated by the Chicago, North Shore and Milwaukee Railroad, and the Milwaukee Electric Railway & Transport Co. As of 1950, more than 50 motor carriers operated from Milwaukee. Air transportation was being furnished by four major airlines with nearly 50 scheduled daily outbound flights a day from Milwaukee's chief airport, General Mitchell Field. Feeder lines also connect Milwaukee with 14 other Wisconsin cities. General Mitchell Field, 2½ miles square, with three directional runways ranging in length up to 6,700 feet, is operated by the county and was built at a cost of \$9,000,000.

Communications.—Milwaukee is served by two large daily papers. The larger is *The Milwaukee Journal*, an independent, largely employee-owned paper with a daily circulation of 325,039 and Sunday circulation of 431,610 (ABC average for six months through March 1950). The other is the *Milwaukee Sentinel*, with a daily circulation of 169,445 and Sunday circulation of 298,661. There is also a Polish language daily, the *Kurier Polski*, and other small weekly and semiweekly foreign language papers. As of 1950, the *Journal* owned radio station WTMJ and television station WTMJ-TV, the only television station in Wisconsin; the *Sentinel* owned radio station WISN. Five other Milwaukee radio stations also served the area.

Education, Culture and Recreation.—Milwaukee's schools rank high. Among the nation's 20 largest cities, Milwaukee has (1950) the highest percentage of school attendance in the 16-20 year age bracket, the second highest rank among the 13 largest cities in per capita high school attendance, and the highest per capita night school enrollment in the United States. Milwaukee's public school system had a total enrollment of 69,063 in May 1950. There were 98 public schools in the city: 75 elementary, 4 junior trade, 4 junior high, 11 high, 2 technical high schools, and 2 special schools. There were also 92 parochial schools enrolling 36,417 pupils. On the collegiate level, the largest institution in Milwaukee is Marquette University (q.v.). Its enrollment, including the liberal arts college and the schools of medicine, dentistry, law, and engineering, was 8,745 in 1949. The University of Wisconsin's extension division in Milwaukee had an enrollment of 6,346.

Milwaukee State Teachers College had 1,710 students. Other smaller institutions of higher learning include Milwaukee-Downer College (for women); Concordia College (Lutheran); Mount Mary, Alverno, Cardinal Stritch colleges and St. Francis Seminary (Catholic); the Wisconsin College of Music, the Milwaukee School of Engineering, and several business and specialized schools of collegiate level. Vocational and adult education, administered by a separate school board, is centered in the Milwaukee Vocational School, largest of its kind in the country. Occupying an entire city block, this school has day and evening classes, several hundred classrooms, two auditoriums, dozens of manual art shops, 350 teachers and 1,100 courses. Milwaukee's municipal recreation department conducts an extensive program of cultural and recreational activities in social centers and on school and municipal playgrounds. It sponsors such theater groups as the Milwaukee Players and the Municipal Children's Theater; such musical groups as the Civic Light Opera Company, the Andrew Jackson Chorus, the Florentine Opera Chorus, and the All City Ballet Group. It sponsors the Municipal Folk Council. The county-sponsored symphony orchestra presents an annual summer concert series, starring nationally known guest artists, in the Blatz Temple of Music, an outdoor amphitheater in Washington Park. The county also sponsors an extensive program of other musical and theatrical events in Milwaukee's parks. In 1950, the Milwaukee Public Library and its 19 branches had a collection of more than 1,200,000 books, most of which were on open shelves. The library board operates the Charles Allis Art Library in the former home of a leading industrialist of the past. The Milwaukee Public Museum is one of the finest municipally-owned natural science and history museums in the country. Art museums include the privately endowed Layton Art Gallery and the Milwaukee Art Institute. The county historical society operates a museum in the courthouse and another in the Falk House, former home of another pioneer industrialist.

Milwaukee's county park system is outstanding. The system includes 75 parks, parkways and squares, totaling 6,349 acres. The parks contain seven public golf courses, eight swimming pools, eight beaches and many tennis courts; baseball, football, and soccer fields; skating rinks, toboggan slides, and boating lagoons. The conservatory in Mitchell Park and the Botanical Gardens in Whitnall Park are nationally known. The zoo in Washington Park occupies 22 of the park's 149 acres and displays more than 1,000 animals and birds, many in settings simulating their natural habitats. Land had been bought by 1950 for a zoological garden of more than 100 acres on the city's outskirts. The largest parks are Whitnall, 634 acres; Brown Deer, 365; Grant, 360; Lincoln, 309 and Greenfield, 278. Juneau Park along Lincoln Memorial Drive is an outstanding example of lake-front park development; and Root River and Menomonee parkways, of river bank development. The city operates seven indoor swimming pools.

Many of the governmental offices of city and county are centralized in a civic center, along a broad landscaped boulevard, Kilbourn Avenue, near the heart of the city. The first unit of the civic center was the Public Safety Building, housing the police and fire department administration, built in 1929. The \$8,000,000 Milwaukee

County Courthouse was finished two years later. Other structures in the area include the Milwaukee Public Library and Museum Building, the municipal auditorium, and an arena (seating 13,000) completed in 1950 at a cost of \$5,100,000. Milwaukee County has 380 churches, of nearly all denominations, and is the seat of a Catholic archdiocese and an Episcopal bishopric. The Roman Catholic church has by far the largest membership in Milwaukee County, its 259,682 members in 1949 outnumbering all Protestant denominations combined. The largest Protestant denomination was the Lutheran, with 106,024 members. The Methodist and Evangelical denominations ranked next with nearly 12,000 members each.

Book Editor, "The Milwaukee Journal"; Author
of "The Wisconsin Story."

MILYUKOV, myi-lyōō-kōf', Pavēl Nikolae-
vich, Russian historian, educator and political
leader: b. near Saint Petersburg (now Lenin-
grad) Jan. 28, 1859; d. Aix-les-Bains, France,
March 31, 1943. Educated in Moscow he became
a tutor in history at the university in 1886-1895.
Because of his liberal views regarding political
reforms he was banished from Russia. He then
went to Bulgaria and became professor of history
at the University of Sofia. In 1897-1898 he
traveled in Europe and then came to the United
States. Settling in Chicago he lectured on Rus-
sian subjects at the University of Chicago. A
course of lectures delivered there was published
in 1905 under the title of *Russia and Its Crisis*.
In 1905 Milyukov returned to Russia on the
outbreak of the revolutionary movement to fur-
ther the cause of liberty. He was imprisoned for
a while, but on his release resumed his activities
and was instrumental in forming the Union of
Unions (composed of the educated and profes-
sional classes). He was elected to the first Duma
as a Constitutional Democrat, which party (uni-
versal suffrage and constitutional government) he
had created. While the Duma was in session
he was arrested. After a month's imprisonment
he was liberated. He was a member of the
Balkan Committee of Inquiry which investigated
the conduct of the war of 1913. Milyukov edited
the Constitutional Democrat papers, the *Free
Nation* and *Popular Rights*, until they were sup-
pressed, and the Petrograd newspaper called
Rech. Besides a vast number of essays and
magazine articles he has published many books.
These include *Main Currents of Russian His-
torical Thought* (1893-1895); *Sketches of the
History of Russian Culture* (1895-1896); *Russia
and its Crisis* (1895); *Democracy and the Sec-
ond Duma* (1905); *A Year of Struggle* (1907);
The Balkan Crisis and Politics (1910); and
Russia's Catastrophe, 2 vols. (1927).

MILYUTIN, myi-lyōō'tyīn, Dmitri Alek-
seevich, Russian field-marshal: b. 1819; d. Yalta,
Crimea, Feb. 5, 1912. The son of poor parents,

he entered the army in 1833 and studied at the
Military Academy in Saint Petersburg (Petro-
grad), where he became professor of geography.
His first active service was in the Caucasus
against Schamyl. From 1861 to 1881 he was
minister for war, during which long period he
introduced important reforms, especially the es-
tablishment of conscription in 1874. He took part
in the Russo-Turkish War in 1877-1878 and for
a time added the duties of foreign minister to
his own. He retired in 1881 and devoted himself
to writing military history.

MIMANSA, mē-mān'sā (from the Sanskrit
man, to investigate), investigation, is the collec-
tive name of two of the six divisions of orthodox
Hindu philosophy. The two Mīmāṃsā divisions
are: (1), the Pūrva-mīmāṃsā (Prior Inquiry, or
Karma-mīmāṃsā), investigation concerning works
that deal chiefly with the Vedic ritual and its
significance; and (2), Uttara-mīmāṃsā (Later
Inquiry, or Brahma mīmāṃsā), investigation con-
cerning the Supreme Spirit, or, more commonly,
Vedānta (see VEDĀNTA PHILOSOPHY), dealing
with speculations on the nature of the Supreme
Spirit. The principles are embodied in a series
of *Sūtras*, or aphorisms, in 12 books, discussing
the sacred ceremonies of the Veda and the merit
accruing from their proper performance. Al-
though the Mīmāṃsā is ranked by all Indian
writers with the other philosophical systems, the
term philosophy can hardly be applied to it in the
same sense as to the other systems of philosophy.
The object of the Mīmāṃsā is merely to lay down
a correct interpretation of such Vedic passages
as refer to the Brahmanic ritual; to solve doubts
wherever they may exist on matters concerning
sacrificial acts and to reconcile discrepancies (or
seeming discrepancies) of Vedic texts. Jāmini,
a sage, was the founder of this school of inter-
pretation. The standard introduction to the study
of the Mīmāṃsā is by Mādhava Achārya.

MIMBRES, mīm'brēs, RIVER, a stream ris-
ing on the west slope of Mimbres Mountains in the
northern part of Grant County, N. Mex., flowing
south across Luna County near Deming and
disappearing in the wide desert flat east of
Florida Mountains. This flat is separated from
Rio Grande Valley but to the south opens into
the wide basin which contains Lake Guzman in
Sonora, Mexico. The river has running water
in Grant County, but excepting in time of freshet
is dry in Luna County. The name is Spanish
for osier or water willow which grows in the
upper part of the valley.

MIME, mim, a dramatic entertainment, na-
tive to Sicily and Magna Graecia, and appealing
to popular taste by its scurrilous caricatures of
low life. Originally performed in public squares
on festival days, it was later developed into
artistic form by Sophron Syracuse in the 5th
century B.C. The *Mimiambi* of Herondas (q.v.),
a Greek poet of perhaps the latter half of the
3d century B.C., representing the everyday life
of the common people, furnish trustworthy ex-
amples of these literary mimes. The Romans
adopted the mime in its unliterary form as early
as the 3d century B.C., but it was not until
Cicero's time that it received a place in litera-
ture at the hands of Decimus Laberius and Pub-
lius Syrus, of whose works we have fragments.
As an after-piece, and under the empire as an

independent performance, it was as popular as it was indecent in words and action.

MIMETITE, mīm'ê-tit, a mineral consisting of a lead arsenate and chloride closely resembling pyromorphite, occurring in hexagonal crystals. In color mimetite is usually yellow, or brown, rarely white, or colorless. Like pyromorphite, mimetite is found in the upper parts of vein of lead ore where it has been formed by the oxidation of galena and mispickel.

MIMICRY IN ANIMALS. One of the ways by which species and groups of animals are perpetuated. Its effect is to assure the safety of individuals by reason of their having such a likeness to something else that the eye of another animal seeking to do them harm overlooks them, by mistaking their real nature for the object mimicked, so that the enemy passes on. This is one of the phases of protective resemblance, of which the two principal are: (1) *Mimicry*, similarity in form to some inanimate object; (2) *Imitation*, similarity to another animal that for some reason is immune from attack by the enemies of the imitating species. In both cases color is likely to serve as an important element in the practical deception. See also **COLORATION, PROTECTIVE; IMITATION.**

These two phases, and other manifestations of deception for safety's sake, are regarded by the exponents of the Darwinian theory of organic evolution as results of the gradual and unconscious acquirement, through the process of natural selection, of changes advantageous to the animal in its struggle for existence. The present article considers such beneficial results as have been obtained by acquiring by certain animals a resemblance to some vegetable or inanimate article of no interest or value to the enemy.

It is plain that if a moth or a caterpillar sitting on a tree-trunk can be mistaken by a bird or lizard for a bit of lichen or a dried twig it may frequently be passed by, and thus allowed to live long enough, perchance, to perpetuate its species. This happens actually in nature. Mimicry is developed, however, almost exclusively in small creatures that are otherwise defenseless; and sometimes is restricted to the young of a species whose individuals when adult can either take care of themselves well or develop some special method of concealment or passive resistance. It also occurs in a few plants.

It is mainly exhibited by insects, but is manifest in some marine animals, for example sea anemones, which when closed are to all appearance lumps of mud; and many hydroids have a most deceiving resemblance (in our eyes, at least) to the seaweeds on or amid which they grow; while a pipe-fish, standing on its head, among the eel grass alongshore, as is its custom, is as effectually concealed as anything can be. A few large examples might be cited, as the mata-mata turtle of South American rivers, which is so tagged and fringed with outlying processes that it has the exact appearance of a weedy rock; but in this case, as in some others of mimicry, the advantage is more that the turtle's prey (fishes, etc.) will come near enough to be seized before they suspect its fatal presence, than that the turtle itself will be safer.

Mimicry is most prevalent, however, among insects and spiders. These are to be found in all countries with deceptive resemblance to withered, gnawed or moldy leaves; to bits of twig, particles of dung, cocoons whose contents are breaking out; or to any of various objects under which insects seek refuge or concealment, as flakes of bark or bits of stone. The records of observation in the books of Darwin, A. R. Wallace, H. W. Bates, Fritz Müller, and H. O. Forbes and other naturalists abound in instances, many of which were discovered by the merest accident. The classic example is the amazing likeness of a kind of butterfly of the East Indies, when at rest, to a leaf which extends not only to the general color of the under surface of the closed wings and their markings, but to the attitude of the insect as it alights, for it places itself in a relation to the branch to which it clings precisely similar to the natural arrangement of the real leaves about it; and, of course, frequents only the one kind of tree whose leaf is mimicked. A tropical walking-stick insect has flat extensions of the skin along its legs and body which are so shaped, and so mottled in color, that Wallace found even the sharp-eyed Dyak boys of the Bornean forest deceived into thinking this insect "a stick grown over by a creeping moss." But our own northern, greenish-brown walking-sticks are sufficiently deceptive in their twiglike aspect when, as is their custom, they sit on a bush-branch, holding their bodies stiffly out at an angle with their fore legs stretched straight in front of their heads; many must be overlooked for one that is detected. More familiar, perhaps, are the measuring-worms (hairless caterpillars of geometrid moths) which, clasping a branch firmly by their hind legs, will stand out rigidly from it, and maintain this attitude for hours. Their dull gray color gives them exactly the appearance of a broken twig, and as long as they remain motionless they are virtually safe. The whole race of mantids exhibit this character in a greater or lesser degree.

Another very striking example of mimicry is that first made known by H. O. Forbes who met with it in Java and in Sumatra. In the first instance, he noticed a certain butterfly perched, as often happens, on a white patch of bird's excrement dropped on a leaf. Approaching cautiously, he closed finger and thumb over the wings of the insect, which seemed glued to the sticky substance; "To my surprise, however," Forbes relates, "part of the body remained behind, adhering, as I thought, to the excreta. . . . I looked closely at, and finally touched with the tip of my finger, the excreta to find if it were glutinous. To my delighted astonishment I found that my eyes had been most perfectly deceived, and that the excreta was a most artfully colored spider lying on its back, with its feet crossed over and closely adpressed to its body." Forbes made the same mistake a second time, some months later in Sumatra; and speaks of this extraordinary spider as "a living bait so artfully contrived as to deceive a pair of human eyes even intently examining it."

Consult for the examples mentioned above Wallace, A. R., *Malay Archipelago* (New York 1869); Forbes, H. O., *A Naturalist's Wanderings* (New York 1885); Punnett, R. C., *Mimicry in Butterflies* (London 1915); Cott, H. B., *Adaptive Coloration in Animals* (New York 1940).

ERNEST INGERSOLL.

MIMIR, mē'mēr, in Scandinavian mythology, the god of wisdom, and most celebrated of the giants. "Mimir's Well" was the fountain of all wit and wisdom, in whose depths the future was clearly mirrored.

MIMNERMUS, mīm-nūr'nūs, the earliest writer of Greek erotic elegy, was born in Colophon or Smyrna, and lived in the last half of the 7th century B.C. His collection of love poems, called *Nanno* from the name of a flute player whom in his old age he courted in vain, survives only in fragments which may be read in a separate edition by N. Bach (Leipzig 1826) or in Theodor Bergk's *Poetae Lyrici Graeci*.

MIMOSA, mī-mō'sā, a genus of herbs, shrubs, trees and a few climbing species of the natural order Leguminosae. The species, of which more than 200 have been described, are natives principally of the American tropics. They have pinnate leaves, usually spicate clusters of small flowers, followed by flat, oblong or linear pods which when ripe break into one-seeded joints. Many of the species are noted for their sensitive leaves which at nightfall close and droop. Others respond to a touch. Of these the humble or sensitive plant (*M. pudica*) is perhaps the best known.

MIN, mīn, Egyptian god of agriculture, typifying the generative forces of nature. Annual harvest festivals were held in his honor. He is represented as a human being with a headdress of two enormous feathers and in his right hand he holds a flail. Behind him is a shrine with trees. The ram is sacred to him. Min was the local god of Panopolis or Akhmin and of Koptos. In later times Min was identified with Ammon Ra. The Greeks identified him with Pan.

Consult Budge, A. Wallis, *The Gods of the Egyptians* (London 1904); Wiedemann, *Religion of the Ancient Egyptians* (New York 1897); Erman, A., *Life in Ancient Egypt* (London 1894).

MINA, mē'nā, **Francisco Espoz y**, Spanish guerrillero leader and general: b. Ydozin, Navarra, Spain, June 17, 1781; d. Barcelona, Dec. 24, 1836. As he sprang from the yeomen class, he naturally espoused radical and democratic ideas at an early age. When Napoleon tried to seize Spain, in 1808, Mina enlisted in Doyle's regiment and then passed into a band of guerrilleros commanded by his nephew, Xavier Mina. When Xavier was captured by the French in 1810, seven men of the band decided to follow Mina; and soon afterward the Junta of Aragon gave him command of all the guerrilleros of Navarra. The national government of Cadiz gave him rank and in 1812 he was promoted commander in chief in Upper Aragon and on the left bank of the Ebro. Mina was an excellent organizer and strategist. His position made it possible for him to confiscate war supplies imported by the French and to levy duty upon all imported war materials. This provided him with money to pay his troops regularly; and he was, therefore, able to maintain an excellent morale among his men and to please the countryside by avoiding a levy of taxes and contributions. Mina served with distinction under the duke of Wellington in the campaign of 1813-1814 and was frequently wounded. When Ferdinand VII was restored, he fell from favor, made an un-

successful attempt to instigate an uprising among the Liberals at Pamplona and went into exile. The Revolution of 1820 brought him back and he served the Liberal party throughout northern Spain, resisting the French attempts to bring back the king. He was forced by the French to capitulate in November 1823, and the French allowed him to escape into England. In 1830 he made another attempt against Ferdinand; but notwithstanding this, on the death of Ferdinand he was recalled to Spain and the government of the regent, Cristina, gave him the command against the Carlists, in 1835, although fearing his radicalism. By this time his health was broken and he resigned his command in April 1835. A year later he took command in Catalonia and aided in forcing the regent to grant a constitution to Spain (August 1836). Mina was a brave man. Mention is made of him in all the histories dealing with Spanish matters in the early days of the 19th century. In 1825 he published *A Short Extract from the Life of General Mina*.

MINA, **Francisco Javier**, Spanish soldier: b. Ydozin, Navarra, 1789; d. Mexico, Nov. 11, 1817, nephew of Francisco Espoz y Mina (q.v.), with whom he served in the guerrilla warfare against the French in 1808-1810. Taken prisoner, he was detained four years in Vincennes. In 1814 he served against Ferdinand VII, and fled to France and thence to England. While in England he became interested in the cause of Mexican patriots, and, aided by some wealthy Englishmen, he organized an expedition. Arriving in the United States he received support. Two hundred volunteers followed him to Galveston in November 1816. More assistance came from New Orleans. His force landed at Soto Marina, province of Tamaulipas, in April 1817. With his 300 men he took the towns of León and Guanajuato with the fortress of Sombrero and defeated the generals Armiñán and Ordóñez; but he was deserted by his followers, surprised by an overwhelming force and taken to Mexico, where he was shot.

MINA, an ancient Greek denomination of money. The Attic mina contained 100 drachmae, and was valued at about \$16.

MINA-BIRD, or **MYNA**, a starling or grackle (*Eulabes religiosa*), very familiar throughout India and eastward, nesting confidently in gardens. Its color is a deep velvety black with purple and green reflections, and with a white mark on the base of the quills of the wing. The bill and feet are yellow, and there are two yellow wattles on the back of the head. The Hindus regard it as sacred to Ram Deo. Certain other similar species are also called mynas in some localities.

MINAEANS. See **SABAEANS**.

MINARET, mīn-ā-rēt', (Arabic, *minarat*, a lantern), a tower generally surrounded with balconies, and erected in connection with the mosques in Mohammedan countries, and peculiar to Mohammedan architecture from which the muezzin summons the people to prayer and announces the hours, bells not being used by the Moslems. The form is derived from the Pharos light-house at Alexandria. The earliest mosques had

MIMICRY IN ANIMALS

(1) The viceroi butterfly (right) is conceded to be protected by its close resemblance to the monarch (left) which is nauseous to birds and other enemies. (2) Diabolical specter, a mantis from East Africa, woos its insect prey by simulating a flower. (3) Tawny frog-mouth, or morepork, of Australia, shown on nest. When brooding, it resembles the stub of a dead branch. (4) Australian leafy sea horse, or sea dragon, has many leaflike appendages which imitate the seaweed among which it lives. (5) White-tailed ptarmigan, in winter plumage, is camouflaged against the snow. (6) Walking-leaf adjacent countries, similar in shape, color, and vein located only when it move fly (lower) closely resemble (upper)

MIMICRY IN ANIMALS

(1) Tree hopper, central South America. Insect resembles thorn of plants which it inhabits. (2) Looper caterpillar. Standing out at an angle from branch, it is mistaken for a broken twig. (3) Grasshopper, Brazil. Resembles leaf, even to apparent hole and rust spots. (4) Kalima butterfly, India. Wings, turned up, resemble leaf. Tips of rear wings form apparent stem of leaf. (5) Walking stick, Peru. Simulates twigs on which it rests. (6) American bittern. Pose and stripes camouflage bird among surrounding reeds. (7) Leaf fish, South America. Shape, color, and motion resemble dead leaf drifting through water. (8) Sargassum fish, tropical waters. Fantastic form and coloring blend with mass of sargassum in which it lives.

Drawn for "The Encyclopedia Americana" by Alexander Seidel of the American Museum of Natural History

no minarets, the first known being that of Damascus, erected about 705. They are a square construction up to the height of the wall of the mosque, with a winding stairway, and above they are octangular. The tower of the old Madison Garden in New York was copied from the Giralda of Seville, which is 308 feet high. See MOSQUE.

MINAS, Uruguay, the capital of the department of Lavalleja, 56 miles by rail northeast of Montevideo. It carries on a trade in the produce of the surrounding agricultural region, and in the marble and granite of the neighboring quarries. Pop. 8,955.

MINAS GERAIS, mē'nās zeh-rā'esh (meaning «general mines»), or **MINAS**, the most mountainous state of Brazil and its foremost mining zone. Located in the southeastern part of the country, Minas is bounded north and northeast by the state of Baía, east by Espírito Santo, southwest by São Paulo, and west by Goiás. It is separated on the south from its port and chief gateway, the city of Rio de Janeiro, by the small state of Rio de Janeiro. Its area is 221,800 square miles.

Minas has over 200 *municípios*, or city-county political units. For statistical and geographical convenience the state is divided into the following large zones: Triângulo, Oeste, Noroeste, Norte, Nordeste, Sul, Mata, and Centro. The last three are the most populous and important, containing the largest cities and industrial and agricultural enterprises. Neither population nor economic activity is evenly distributed over the state. There is a tendency to overconcentration in southern Minas, which is closer to the city of Rio de Janeiro where much of the food and dairy products of Minas are consumed and from which its coffee and minerals are exported. Large areas of Minas possessing good soil, climate, and resources are still sparsely populated, mainly owing to lack of communications.

The terrain is generally rugged and is crossed from south to north by the Serra do Espinhaço (Spinal Range), highest in Brazil, and by many lesser ranges. The important Rio São Francisco rises in central Minas and is navigable for a great distance in the northern half of the state. Other important river basins are those of the Doce, Jequitinhonha, Paraíba, Paranaíba, Grande, Paraopeba, and Rio das Velhas. None of them has any long navigable stretch except the Grande and the São Francisco. The average elevation of the state is 2,000 feet, with large portions over 2,800 feet. This factor tempers what would otherwise be a subtropical climate. Frosts occur, as do occasional floods and droughts.

Minas Gerais' unusual variation in elevation, climate, and rainfall makes for a rich and diverse flora. Extensive grasslands and zones of scrub and brush have been increased by deforestation since the 18th century mining boom, and by repeated burning by farmers and cattlemen to clear land and improve pasturage. Large sections of the east and northeast are heavily forested, particularly in the tropical Doce Valley. Timber and tropical hardwoods of value are cut. Owing to the state's lack of coal and oil, much charcoal is prepared for the iron and steel industry.

The state is handicapped by its geography,

for it is isolated from the modern world behind its ranges which have retarded transportation and trade, thus adding to the cost of all enterprises. On the other hand, Minas Gerais, because it is mountainous and rainy, has more hydroelectric potentialities than any other state—a quarter of the Brazil total. A number of power dams are in operation and several more are planned.

Brazilians consider Minas Gerais to be their most typical state as it contains every variety of climate, geography, agriculture, industry, and population to be found in Brazil.

History.—Minas was explored and partly depopulated of Indians in the 16th and 17th centuries by the hardy slave-raiding Paulistas, or people of São Paulo. They discovered gold in the late 17th century and started a gold rush to central Minas in the 1690's, which movement affected the course of Brazilian development by disrupting agriculture. Thousands of Portuguese adventurers swarmed inland from Rio, which grew rapidly as the port of Minas. Scores of thousands of planters and Negroes from the sugar plantations of the Brazilian coast plain stampeded to Minas to dig for gold and diamonds, discovered in the 1720's north of the gold fields. Brazil lost its importance as an exporter of sugar, and Minas became its richest province. The corrupt Portuguese monarchy in Lisbon victimized Minas with numerous soldiers, officials, and tax collectors. Diamonds were declared a royal monopoly, although smuggling was rife, and all economic life except mining was discouraged. Minas remained an illiterate, backward province till well into the 19th century; yet it had a golden age of architecture, poetry, and art in the 18th century when central Minas built many beautiful mansions and churches in the mining cities. The gem of these old towns is Ouro Preto, full of statuary and churches created by Antonio Francisco Aleijadinho, Brazil's leading sculptor. Ouro Preto has been made a museum city in the heart of Minas Gerais.

Minerals, Metallurgy and Trade.—Minas Gerais is one of the world's great storehouses of minerals. It contains over one-fifth of the world's iron ore. The Brazilian iron and steel industry, which at present is small but has great possibilities, is centered in Minas Gerais and the Paraíba Valley in the adjoining state of Rio de Janeiro. Brazil's per capita consumption of steel is only 20 pounds a year, as compared with 850 pounds in the United States. As recently as 1941 both the Brazilian and the United States banks and governments were co-operating in efforts to expand the iron and steel industry of Minas. Several large steel mills were under construction or were being expanded, and more were planned. The \$45,000,000 Volta Redonda steel mill, starting operations in 1944 with iron from Minas, is considered by Brazil to be the most important plant in the country's program of development. The United States has co-operated with Brazil in supplying funds, technicians, and equipment. Steel expansion in Minas should raise the standard of living and increase the market for American products.

In 1941 Minas Gerais greatly increased its formerly modest exports of strategic minerals to the United States. The two countries, on 14 May 1941, signed an agreement whereby the United States was to take almost the entire out-

put of Minas; chromite, manganese of ferro grade, mica, bauxite, quartz crystal, nickel, tungsten, graphite, and a few others are shipped exclusively to the United States. Chief is manganese, of which Minas has ample reserves of high grade, often over 50 per cent metal content. In the first five months of 1941, over 150,000 tons were shipped to the United States through Rio de Janeiro. In August of 1941, it was planned to raise this total to over 450,000 tons of manganese ore by mid-1942, along with some 80,000 tons of bauxite and 5,000 tons of chromite ore, plus other minerals totaling more than \$12,000,000. The second World War and rearmament made North American firms and banks, both private and governmental, more interested in Minas.

Minas has been the chief producer of gold and diamonds in Latin America since colonial days. The gold is bought by the Banco do Brasil, and the diamonds, chiefly industrials for machine tools, go to North America.

The central zone of the state is the most rugged and mineralized, and many of the ores mentioned lie in rough terrain served by neither rail nor highway. The United States Steel Corporation has an investment in the best manganese lands, valued at over \$4,000,000, near Ouro Preto, some 300 miles north of Rio harbor, on the Central Railway which lacks the roadbed and equipment for really significant mineral shipments. Many more technical surveys, transportation improvements, and capital investments will be necessary before the minerals of Minas can be shipped or smelted in quantity. Since the United States has been consuming its own minerals at a rapid rate, and since Minas needs technical and financial aid and the machinery to industrialize, it might be assumed that a sound trade basis could well be established.

Agriculture.—Minas is overwhelmingly dependent on farming and livestock and is one of Brazil's three leading states in both. It is first in corn, hogs, beans, and dairy products, but suffers from agricultural backwardness, erosion, and inefficient methods. Minas needs many reforms before its agriculture will become really profitable, and its food supplies adequate. For one thing, the land must be distributed and a rural middle class fostered. More fruits, meat, dairy products, and fresh vegetables should be grown for Minas' own consumption, for canning or preserving, and for sale in Rio and abroad. The state has few canneries or packing plants as yet. As a rural region, Minas fails to secure its share of the national income, and its farmers and sharecroppers have pitifully low purchasing power.

Manufacturing.—Minas Gerais is far from being self-sufficient industrially, although it has a variety of small factories. The state has 16 per cent of Brazil's population, yet it produces only 6.5 per cent of the nation's textiles and light manufactures, almost entirely for consumption within the state. It has been importing manufactures from its more advanced neighboring states, notably São Paulo.

Pending publication of the results of the 1940 census, only estimates are available on many aspects of manufacturing. The state's manufactures rose steadily in importance in the 1930's, becoming 11 per cent of the national total in 1940, if heavy industry be included. But because it is an isolated inland state, Minas is

much less geared to imports and exports of manufacture than most of Brazil. The state's purchasing power, like that of any predominantly agricultural area, is too low to stimulate much manufacturing, but Minas is trying to attract more factories, especially to the new industrial district outside the model state capital, Belo Horizonte. Cheap electricity is expected to be a stimulant. In 1937 Minas Gerais had over 7,000 small industrial establishments, with more than 78,000 workers. Including the large foreign-owned steel and mineral enterprises, the capitalization was above \$44,000,000.

By using water power Minas should be able to attain industrial independence and a better balanced economy, but capital and equipment are badly needed. Economists have commented for years on the state's unique resources and potentialities for industrialization.

Transportation.—One of the chief needs in Minas is for an adequate system of hard-surfaced highways and for an enlarged railway network unified with one gauge. Railroad improvement, electrification, and new construction have been inadequate, which fact handicaps industrialization, trade, and mining. Funds are badly needed for construction of communications to link the several zones of Minas to each other and to Rio and São Paulo, although Minas leads Brazil in railways with 8,150 kilometers. It is second in roads with 38,000 kilometers, but 90 per cent of these are dirt and almost impassable in wet weather. Minas has relatively few trucks and automobiles, but there are some useful bus and truck lines.

Of the railways, the Central do Brasil serves Minas and is the nation's longest. Next is the state-built Rede Mineira de Viação. Third is the British-built Leopoldina Railway. Also important is the Vitória line connecting central and eastern Minas with the growing port of Vitória in Espírito Santo. Most lines are federally aided and controlled.

Air travel is centered principally at Belo Horizonte (beh'l'ô-rê-zôn'teh), the capital of Minas Gerais and the largest city in the state. Its population in 1941 was estimated at about 200,000. It is an attractive modern city, situated in an agricultural and mining region, 376 miles north of Rio de Janeiro, on the Central do Brasil Railway. The climate is pleasant and the environs noteworthy. Points of interest include the magnificent public buildings and the municipal park. The public facilities of the city have been practically rebuilt since 1894. The chief airline is Panair do Brasil, part of Pan American Airways.

Population.—Estimates in 1939 gave Minas nearly 7,000,000 people, called *Mineiros*. Mineiros are peasants of mixed race, often a three-way blend of Negro, Indian, and Portuguese, but predominantly Portuguese, racially and culturally. They have many excellent qualities, including freedom from race prejudice.

Indian, Negro, and Caucasian bloods have blended more thoroughly in Minas than elsewhere in Brazil. It is the most populous state and in it Brazil's two great regions, the North and the South, overlap: Mineiros are more Caucasian and suffer less disease, poverty, and illiteracy than the people of North Brazil; and they are less white and have less prosperity than the inhabitants of advanced South Brazil.

The population of Minas rose from 250,000

in 1750 at the end of the mini boom, to 1,000,000 in 1840, and to 2,000,000 by 1870. The state had approximately 3,200,000 inhabitants in 1890, and 5,880,000 in the census of 1920. Minas received possibly 300,000 Portuguese, Italian, Syrian, and other immigrants between 1880 and 1930, mostly from Latin Europe. Minas is but slightly urbanized. It has a few small cities, only two having over 100,000—Juiz de Fora and Belo Horizonte.

Education.—Scant progress was made in education till recent years. As late as the 1930's, the high illiteracy of Minas (possibly over 70 per cent) was being reduced at only a slow rate because so few children attend school. By 1938, grade school registration in some 5,300 schools was over 430,000, but with thousands attending irregularly and for only a year or two. For a population of nearly 7,000,000, schools are small, few, and mediocre. Several good technical and special institutions were founded after 1936, however, and a strong effort is being made to improve education. The best schools and the professional faculties of the University of Minas Gerais are in Belo Horizonte. In 1936, only 98 of the over 200 *municípios* gave instruction beyond the seventh grade, and but 41 had full secondary education.

Library of Congress.

MINAS DE RIO TINTO, Spain, town in the province of Huelva, 32 miles northeast of the city of Huelva. The mountainous country in which this town is situated contains rich deposits of copper ore which were worked by the ancient Phoenicians. In 1873 a London company took control of these mines and produced the ore by new methods. More than 10,000 workers are now employed. The ore produced averages over 1,600,000 tons yearly. In 1845 the town had only 800 inhabitants; in 1910, 12,626; in 1930 it was about 10,000.

MINBU. A district and division of Upper Burma. This district consists of 3,299 square miles with a population of 270,000. The physical

features exhibit low plain land toward the Irrawaddy, and an undulating country inland, rising ever higher westward toward the Arakan hills. Between the plain and the Arakans run the Nwa-Madung hills, north and south. The chief rivers and streams are the Irrawaddy, the Môn, the Maw and the Salin. They are much used for irrigation. Along the Irrawaddy and in the lagoon fed by it, called Paughlin Lake, there are fisheries, the rights to which are sold yearly by public auction, and realize an average of \$5,000. The valleys are cultivated, but are deadly except to natives. Oil has been discovered near the mud volcanoes of Minbu, but lies too deep to be profitably worked. Along the Môn River the betel-vine is cultivated. The district of Minbu contains much forest land. The chief crops are rice, millet, grain, beans, peas, sesamum and tobacco. The annual rainfall varies everywhere. In the hot months the thermometer rises to 100° F., and in December it falls to 49° F. The chief town is also called Minbu. It is situated on the Irrawaddy, which is here three miles wide with many islands and sandbanks. Pop. about 5,780. In the dry season the steamers cannot come nearer to the town than two miles. The division of Magwe consists of the districts of Minbu, Magwe, Thayetmyo, Pakókku and the Chin Hills. Its area is 29,040 square miles. Pop. about 1,557,609.

MINCH, The, Scotland, the channel off the northwest coast between the mainland and the northern part of the Outer Hebrides; it is from 25 to 45 miles wide and has a very rapid current, and on either side are numerous lochs or sea-arms penetrating inland. It is connected with the Sea of the Hebrides on the south by the Little Minch, the channel between the island of Skye and Long Island; it is from 14 to 20 miles wide.

MINCIO, mìn'chō, Italy, a river, the ancient Mincius, which flows from the south extremity of Lake Garda, near Pescheria, and after forming the lake and marshes that surround Mantua, falls into the Po eight miles below the city. Its banks are remarkably fertile, and celebrated for their beauty by Virgil, who was a native of this country. It formed an important base of operations in the wars between France and Austria. The length of its course is about 115 miles.

MINCOPIES, min-kō-piz, natives of the Andaman Islands. They are typical Negritos, averaging less than five feet in height with cephalic characteristics similar to those of the negro. Their condition is low. They live in open huts (called chongs), consisting of a roof on four stakes, and subsist on roots, wild fruit and game. In hunting they use a peculiar S-shaped bow. There are 12 tribes of Mincopies, all descended from a common stock but each with its own dialect and tribal habits. Consult Deniker, 'Races of Man' (1901); Brown, A. R., 'Notes on the Language of the Andaman Islands' (1914) and 'Aborigines of the Andaman Islands' in the *Journal of the Anthropological Society* (Vol. XI, London 1882).

MINDANAO, mên-dâ-now', Philippines, the most southeastern and second largest island of the archipelago, lying between lat. 5° 35' and 9° 50' N. and between long. 121° 53' and 126° 28' E., about 220 miles northeast of Borneo. It is bounded on the east by the Pacific Ocean and on the west by the Sulu Sea; area, 36,906 square miles; with its dependent island, 37,742 square miles.

Topography and Climate.—The outline of the island is very irregular and the coast is uneven and much indented with deep bays and inlets; the shore line is 1,592 miles and the width of the island from east to west 386 miles. The island is very mountainous, particularly in the interior, the mountain system consisting of a number of irregular ranges extending generally north and south, and as a rule approaching near the coast. The mountain formation shows the effect of earthquake and volcanic action, and there are many volcanoes, some of which are active. The principal peaks are Apo (10,312 feet), near the southeastern coast, and Malindang (8,560 feet) in the northwest. The island is drained chiefly by two large rivers, both over 200 miles long, the Grande de Mindanao (q.v.), flowing southwest and west, on the western side of the central mountain range, and the Butuán or Agusán, flowing northwest, on the eastern side of the same range. There are numerous other small streams and nine large mountain lakes. There are iron springs at Placer, in the province of Surigao; sulphur springs at Mainit, Surigao and Balingasag, Misamis, and medicinal thermal springs at Malibato. As the island is within 10° of the equator, the climate is hot and humid, but more equable than that of Luzon; rains are frequent and heavy, the annual fall being 100 inches.

Forests and Fauna.—The island is covered with forests of valuable woods for ship and house-building and furniture making; among these are the molave narra (similar to the yellow pine), teak, ebony and cypress; the gum and resin-producing trees and medicinal and dye plants also grow abundantly. Animal life is abundant in these forests; over 200 species of birds have been classified, of which 17 species are peculiar to Mindanao and Basilan; deer, wild hogs, monkeys and the haguang or colugo (q.v.) are numerous. Reptiles, including the giant lizard, iguana and large snakes, particularly the boa, also infest the forests and crocodiles the river.

Industrial Resources.—The staple, agricultural products are rice, sugar, cotton, corn, tobacco, indigo, coffee and hemp; other products of special value are cloves, nutmegs, cinnamon and other spices, betel nuts and betel peppers. The most important industry is the cultivation and shipment of hemp and forest products; large herds of cattle and horses are raised; and there is a little weaving of hemp and cotton fabrics for home use. Less than 2 per cent of the land is under cultivation. Edible birds' nests are also gathered and exported. Communication is largely by water, as there are few roads except in the immediate vicinity of the chief towns, and the towns and

villages are situated on the coast or on the large lakes and rivers. Gold is obtained in small quantities by the natives, and is doubtless abundant; coal, sulphur, copper and platinum are also reported.

People and Government.—About a third of the population of Mindanao is composed of Christianized Malays; there are also tribes of the Moro race who are Mohammedan in religion; the interior is peopled by pagan tribes and the northern and eastern coasts by Visayan Filipinos. The island was first occupied by United States troops in 1899. Civil government was provided for Mindanao and adjacent islands under the Philippine Commission in 1903, under the name of the Moro Province. In 1914 the department of Mindanao and Sulu was created, the military governor of the old Moro province giving place to a civil governor invested with wide powers and whose constructive task it will be to bring a turbulent and suspicious Mohammedan population into harmonious relations with the Christian Filipinos. There was a serious outbreak of cholera in 1915. Pop. 499,634. See PHILIPPINE ISLANDS; MOROS.

MINDANAO, Grande de, grân'dâ dâ mên-dâ-now', a large river of the island of Mindanao, Philippines. It rises in the Rangayán Mountains, flows south to the Lake of Liguasan, and passing through this lake flows northwest to Illana Bay. About 25 miles from its mouth it divides into two branches, which enter the bay about five miles apart, with a large delta between them; the north arm is the larger and more navigable; the south arm is narrow and only five feet in depth. The river is navigable for 70 miles for small vessels not drawing over four feet. Its course is mostly through a very fertile region and it drains an extensive plain with several large lakes; in length and volume it is the largest river of the Philippines. In the upper part of its course it is known also as the Pulangui.

MINDEN, Nebr., city and Kearney County seat; alt. 2,165 feet; 32m. SW. of Hastings; on the Chicago, Burlington and Quincy Railroad. It is in a fertile agricultural area producing wheat, corn, hay, livestock, poultry, and dairy products. It has a school book publishing plant and manufactures of neon signs, automobile repair tools, and butter. Pop. (1930) 1,716; (1940) 1,848.

MINDEN, Prussia, a town of Westphalia, on the left bank of the Weser, 35 miles southwest of Hanover. It is one of the oldest towns in Germany and the streets in the ancient parts are narrow and crooked. It has a fine cathedral of the 13th century, in the early pointed Gothic style, a gymnasium and an orphan hospital; manufactures of linen and cotton, tobacco, chicory, chemicals, soap, lamps, machinery, etc., and an important transit and general trade. It was made the seat of a bishopric by Charlemagne, was afterward a member of the Hanseatic League, became a possession of the Elector of Hanover and finally passed into the possession of Prussia in 1814. On 1 Aug. 1759 the French were defeated here by an Anglo-Hanoverian army during the Seven Years' War. Pop. about 27,000, predominantly Protestant.

MINDEN, Battle of. This noted action of the Seven Years' War (q.v.) was fought on Aug. 1, 1759 between the Anglo-German army commanded by Duke Ferdinand of Brunswick and the French army under Marshal Inuis Georges Brasse de Contades. The British and Hanoverian infantry signally defeated the French cavalry. However, Lord George Sackville, commander in chief of the British contingent, flatly refused to obey the order of Ferdinand to send Lord Granby's English cavalry squadrons into the fray. Consequently the Allied victory was decisive.

MINDORO, mēn-dō'rō, Philippines, an island lying south of Luzon, a little north of the center of the archipelago; length, northwest to southeast, 110 miles; width, northeast to southwest, 56 miles; area, 3,928 square miles, with dependent islands, 4,024. The island, which is oval in outline, is mountainous, the general topographical features consisting of several high broken ranges, forming an elevated plain in the interior; and from this plain sierras extend in different directions toward the coast, which is mostly low and marshy, especially on the north and east; on the west coast along Mindoro strait is prairie land. The culminating point of the mountain system is Halcón Mountain in the north (8,800 feet). There are numerous small rivers, but no general river system of main stream and tributaries. The climate is variable; the rainfall heavy and monsoons frequent; the western coast is temperate and healthful, but the northern and eastern coasts are hot.

At one time, before the decay of the Spanish monarchy, the rice yield was so abundant that Mindoro was called "the granary of the Philippines"; but the frequent attacks of Moro pirates destroyed the prosperity of the island, and the agricultural products are now unimportant, being almost entirely for home consumption. Sugar cane is being profitably exploited; rice, cocoa, tobacco, hemp, cotton, etc., are raised; the cultivation of hemp is increasing and a small amount of cotton is exported to the island of pil. In the time of the early Spanish explorers reports of great mineral wealth, especially gold, were circulated; the real mineral resources are but little known, though as far as modern exploration has gone, copper, gold and coal have been found. The island is heavily wooded and its chief commercial wealth is in forest products; the trees include cedar, ebony, mahogany, gum trees, gutta-percha, palms and dye woods. Near the principal towns wood-cutting and attan-splitting for the Manila market is the chief industry; rattan, buri, honey, forest gums, balao oil, pitch and other forest products are the chief articles of export; tortoise-shell, obtained from the small neighboring islands, and anoes cut from a single piece of wood are also exported; and there is a considerable production of sago. There are only a few roads, access inland villages being by mountain trails or river-canoes; the local trade between coastal towns is carried on mostly by native sailing raft; all exports for Manila and other islands are concentrated at ports of call for steamers.

In June 1902 civil government was extended to Mindoro and adjacent islands, and it was detached from the province of Cavité and made a subprovince of Marinduque (q.v.). The in-

habitants of the interior are wild tribes, among whom the Manguianes (about 15,000 in number) predominate; the people of the north coast are mostly Tagálogs, those of the south coast Visayans. The population including the wild tribes of the interior (1939) 131,569.

MINDOVE, MENDOG or MINDOG (Lithuanian, MINDAUGAS), first historical sovereign of Lithuania, assassinated in 1263. The son of a certain Ryngold, his genealogy is mythical and little is known of his life. He achieved the unification of the Lithuanian tribes by murdering his brothers and nephews, and extended his sway to the south and east. He was baptised a Christian in 1251 and crowned in 1253. Subsequently he relapsed into paganism. He warred with the Teutonic Knights and the Sword-bearers (Portglaives). After his death Lithuania again fell into anarchy.

MINDSZENT, town of Hungary situated about 80 miles southeast of Budapest on the Tisza River in the district of Csongrad. It is a market town in a region devoted to agriculture and cattle raising. Pop. (1941) 9,630.

MINDSZENTY, Josef, Hungarian cardinal and primate of Hungary: b. Csehimindszent, Hungary, Mar. 29, 1892. He was ordained priest on June 12, 1915, was consecrated bishop March 3, 1944, and on Oct. 2, 1945 was appointed archbishop. On Feb. 18, 1946 he was created cardinal. During the German army's occupation of his country he was imprisoned by the Nazi allies of Hungary because of his outspoken opposition to fascism. After the Communist coup d'état of May 30-31, 1947 and the rigged elections of August 31 by which the Communists secured the levers of government, the cardinal realized that he must now battle the forces of communism in defense of Christian religion and morals. On May 23, 1948 he issued a pastoral letter condemning the proposed nationalization of Hungarian schools. On June 5 the Hungarian government responded to a radio appeal of Pope Pius XII to Hungarian Catholics, urging them to resist the Bolshevization of their country, by a peremptory order to Cardinal Mindszenty to stop his "agitation" against school nationalization. The following day the cardinal instructed the Catholics of his country to boycott pro-government newspapers and radio broadcasts which he denounced for their "falsehood, deceit and terror." On June 10 he informed the government that the church would discuss an agreement only if assured that its schools, the dissolved Bishops' Society, its property and newspapers would not be molested. To this proposal the minister of education replied that the church must recognize Hungary's "institutions, including land reforms and nationalization." There was a brief lull in the conflict between the Communist government and the ecclesiastical authorities. Then, on November 27, Deputy Premier Matyas Rakosi, secretary general of the Hungarian Communist Party, issued a violent denunciation of "spies, traitors, smugglers and Fascists dressed in the robes of a cardinal." On Dec. 27, 1948 it was announced that the cardinal had been arrested in his palace at Budapest and was imprisoned. The charges alleged against him were: plotting against the government, spying, treason and blackmarket dealings in currency. Thus was

fulfilled the cardinal's prediction made in a pastoral letter of November 20 that he would soon be silenced by the government. Arrested with him were his secretary, Dr. Andras Zachar, and 12 other alleged accomplices in the crimes, including priests and laymen. All were held incommunicado. On Feb. 2, 1949, the last opposition party in Hungary, the Democratic People's Party, expired, dissolved by its head, Istvan Barankovics who fled for sanctuary to Vienna. The trial of the Hungarian primate began the next day in the Communist People's Court of Budapest with Judge Vilmos Olti presiding. The prisoner, now viewed by foreign correspondents for the first time since his incarceration, had undergone such extraordinary physical changes in little more than a month that he was scarcely recognizable. It was widely believed that he had undergone tortures at the hands of both the Hungarian and the Russian secret police in order to force him to sign self-incriminating statements for the use of the prosecution. On February 8, after three days of court proceedings, he was sentenced to life imprisonment, having been convicted of treason, trying to overthrow the republic, and foreign currency speculation. All his co-defendants were also adjudged guilty in various degrees.

MINE ACCIDENTS AND THE UNITED STATES BUREAU OF MINES.

Notwithstanding the fact that state mine inspection work was started in Pennsylvania as early as 1869 and was adopted gradually by many other mining states well before the beginning of the 20th century, the mines of the United States, and more particularly the coal mines, had established an extremely bad record for accident occurrence, particularly mine explosions. The record became increasingly worse during the first decade of the century and especially during the 5-year period, 1906-1910, inclusive. In those 5 years, there were 84 major coal mine disasters (accidents in which 5 or more persons were killed), with a total of 2,494 fatalities, resulting chiefly from explosions and fires. In one year (1907), there were 18 major coal mine disasters with a total of 919 fatalities, an average of 1½ such disasters per month. In one month (December 1907), there were 5 major coal mine explosion or fire disasters (2 in Pennsylvania and one each in Alabama, New Mexico, and West Virginia), with fatalities totaling 702 or considerably more than the 669 for the entire six years, 1942-1947, inclusive, or the 596 in the 6 years, 1943-1948, inclusive.

Before the beginning of the century, the mining industry had been insistent in its demands for the establishment of a federal department of mines, the western metal-mining people being particularly interested, chiefly for economic reasons. Relatively little progress was made, however, until the epidemic of coal mine disasters in the first decade of the century convinced the entire country that the coal mine disaster problem was one too difficult for the individual states to handle. By 1910, it was the consensus, as expressed editorially in both the public and the technical press and through numerous other agencies, that the problem was one which required vigorous action by the nation as a whole.

At congressional hearings which preceded passage of the act creating the United States Bureau of Mines in the spring of 1910, approximately 100 persons testified or filed statements; they represented practically all phases of the min-

eral industry, as well as interests or organizations of a public nature, many of which were almost entirely unconnected with the mineral industry. While numerous matters pertaining to the mining industry were presented as reasons for establishing a federal department of mines, almost everyone gave specific attention to the mine safety feature. There is no doubt that the safety problem was the dominating factor in securing passage of the act creating the Bureau of Mines. The agency began to function officially on July 1, 1910, as a unit of the Department of the Interior.

The first annual report of the director of the Bureau of Mines, issued in 1911, states:

The Bureau of Mines was established by an act of Congress (36 Stat., 369) approved May 16, 1910, and effective July 1, 1910. *The demand for special recognition and aid from the Federal Government for the mining industry had been increasing for a number of years, especially among the metal-mining interests in the Western States, and from time to time bills looking to the creation of a national bureau or department of mines have been introduced in Congress by representatives of those States. At the time of the passage of the act establishing the bureau, however, the factors that were most effective in calling attention to the advisability of action by the Government were disasters in coal mines and a growing realization of the waste of both life and resources in the varied mining and metallurgical industries of this country.*

Hence, from the earliest period of the existence of the Bureau of Mines, one of its main objectives has been the prevention of loss of life and limb, and the protection of the health of those who make available the mineral products that are one of the nation's most important sources of greatness, and which assume even greater importance in time of war. During the years that have intervened since the bureau's establishment in 1910, it has consistently and continuously conducted a campaign, primarily educational, designed to achieve the above-mentioned objectives. Educational procedures are used partly because the bureau has no legal authority to enforce suggestions or recommendations as to health, safety, or efficiency, but chiefly because it is believed that if those engaged in the mining industry are kept informed as to what can or should be done, eventually they will adopt and maintain such measures. The nationwide nature of the bureau's health and safety work permits its representatives to become better acquainted with matters pertaining to health and safety in the mines of the United States than can representatives of any other agency—private, industrial, state, or federal.

The health and safety work of the bureau is administered through field districts, and, although some changes have been made from time to time, the districting map of the bureau's Health and Safety Division showed, in 1949, that nearly all of the districts and district headquarters established in 1910 and early in 1911 were still in existence at the outbreak of World War II, and afforded an admirable framework for the administration of nationwide field activities of various kinds connected with mining and allied industries. This was especially so because all of the heads of the districts were engineers with 10, 15 or more years of experience in the work of promoting health and safety in the mineral industries. The organizational setup of the division lent itself admirably to rapid expansion to handle new agencies created to forward the interests of the United States in World War II. Three new branches aggregating nearly 400 persons were functioning effectively by 1942.

Before World War II, the field and adminis-

rative personnel of the Health and Safety Division (exclusive of clerks) totaled 70 persons, 35 of whom were engineers. This rather meager group was entrusted with all the bureau's educational and investigative field work among approximately 1,000,000 persons engaged in mining and allied industries—including coal and noncoal mining, quarrying, metallurgical plants, and the petroleum industry, as well as tunnelling. Approximately 17 persons of the Health Branch were engaged chiefly in laboratory work at the Pittsburgh (Pa.) Central Experiment Station of the bureau, and approximately 100 other persons—chemists, physicists, engineers, etc.—in the Technologic Division were also engaged in safety research laboratory or testing work at the Pittsburgh station or at the experimental mine near Bruceton, Pa.

Fundamentally, the bureau's work in health and safety is research and investigative (both field and laboratory), and educational and service (chiefly done in the field). Most of the laboratory research work is done at Pittsburgh and at nearby Bruceton, partly by employees of the Health and Safety branches of the Health and Safety Division, and partly by the Technologic Division; the field investigative work, up to the time of World War II, was done chiefly by Safety Branch employees, with a limited amount by the Health Branch and by the Technologic Division. Field investigation, as well as the educational and service work, was done principally by the employees of the Safety Branch until World War II. Since the addition of nearly 300 field employees in the Coal Mine Inspection Branch of the Health and Safety Division during and after World War II, almost that entire force has been engaged in educational and investigative field work in coal mining; most of the personnel of the Safety Branch have devoted their activities to noncoal mining. During World War II the Safety Branch had assigned to it the Mechanical Electrical Section with about 16 employees, engaged largely in the testing of electrical mine equipment, the work being done chiefly at the Pittsburgh experiment station.

The bureau's accident prevention work is almost entirely educational, information being conveyed to those engaged in mining and allied industries partly by the field workers in person; partly through publications; and, to a limited extent, by motion pictures. By far the most effective method of getting this information to the workers has been through safety courses of various kinds, supplemented by other types of contact work done by the field personnel of the Health and Safety Division. These men annually talk to, or see or are seen by, several hundred thousand workers, and do educational work of some kind in at least 3,000 mines or mining communities or plants of mining and allied industries.

Experience has taught those engaged in the bureau's accident prevention work that a procedure which is effective with some workers, or under certain conditions, may be utterly futile with others; hence, numerous types of safety training have been used. From the viewpoint of reaching individual workers, the giving of courses in first aid and mine rescue has proved one of the most effective. More than 2,000,000 persons have taken full or partial courses, using the procedure outlined in the bureau's excellent First-Aid and Mine Rescue Manuals. It has been estimated that since about 1930, at least 200 lives

have been saved annually in the mineral industries as the direct or indirect result of this one activity. Courses of accident prevention for mine workers (coal and noncoal), for mine officials, for those handling explosives, for the petroleum industry, and for numerous others, have been given to hundreds of thousands. Printed and multigraphed publications have been issued on several hundred subjects, covering almost every phase of accident occurrence and accident prevention in the mineral industries. The bureau's First-Aid Instruction Manual is known as one of the best available treatises on first-aid instruction; and approximately 2,000,000 copies of it have been issued.

Numerous other procedures are used by the bureau's personnel in their safety education work. They formulate and exhibit motion pictures on safety in the mineral industry; annually give scores of lectures on safety; form and foster safety organizations in mining communities; serve on committees of state agencies, mining institutes, technical societies, etc., engaged in safety work; assemble data on safety performance in the industry; and issue medals and certificates commemorating those safety records. These and many other activities supplement the usual mine and plant inspections, investigations, etc.

Before World War II, almost all of the field educational work was done by the approximately 70 field workers of the Safety Branch, working with an annual budget of less than \$400,000.

The Bureau of Mines has been the sole nationwide agency continually and actively forwarding the prevention of accident occurrence in the mineral industries of the United States. It has actuated other agencies in trying to remedy the disgraceful conditions concerning accident occurrence in the mines and mining plants of the United States during the first decade of the century. During much of the bureau's work, those primarily concerned gave more opposition than co-operation. Notwithstanding the obstacles, the results have been gratifying in every phase of accident occurrence in the mineral industries of the United States.

The dread explosion disaster hazard has been brought almost to an irreducible minimum. Instead of an average of 17 major coal mine disasters per year, with approximately 500 fatalities as in the period 1906–1910, inclusive, there were 6 major disasters in 1948 with a total of 49 fatalities. In 1946, there were 2 major coal mine disasters with 27 deaths; in 1939, 1 with 28 deaths; in 1934, 2 with 22 deaths; in 1933, 1 with 7 deaths; and in the 13-month period, June 2, 1938 to July 14, 1939, there was no major coal mine explosion disaster in the United States. In the month of December 1907, there were more persons killed (702) in the United States in major coal mine disasters than in the 6 years 1943–1948, inclusive (596), and this includes the year 1947 in which the Centralia, Ill. disaster occurred.

Unquestionably the Bureau of Mines has succeeded in carrying out the mandate of the people of the United States, expressed through passage of the Act of May 17, 1910, that the federal government try to do what the states had utterly failed to do; namely, ascertain the causes of coal mine disasters and indicate to the states, as well as the coal mining people, the procedures which would bring these dreadful affairs under reasonable control. Major coal mine disasters have not

been eliminated and there is good reason to believe that they never will be if the United States continues to mine coal in the quantities now required. They have been very greatly reduced both in number and in their destruction of human life and property, as is evidenced by the following figures.

The total number of major coal mine disasters in the 5-year period, 1944-1948, inclusive, was 31 or 63 per cent fewer than the 84 in the 5-year period, 1906-1910, inclusive; and the 417 fatalities from the major coal mine disasters of the 5 years, 1944-1948, inclusive, is 83 per cent fewer than the 2,494 of the 5-year period, 1906-1910, inclusive. In other words, 6 coal miners were killed in major disasters in the 5 years, 1906-1910, inclusive, for every 1 in the 5 years, 1944-1948, inclusive, and the latter period includes 1947, with its Centralia disaster. It is also interesting to note that in the 5 years, 1944-1948, inclusive, the people of the United States had about 30 per cent more coal for their various uses than they had in the 5-year period, 1906-1910, inclusive.

In the 5 years, 1906-1910, inclusive, the coal mines of the United States suffered 13,288 fatalities in the production of 2,255,000,000 tons of coal; in the 5 years 1944-1948, inclusive, there were approximately 5,525 fatalities in the production of about 3,248,000,000 tons of coal; hence, there was a reduction of 58.4 per cent in the number of fatalities in the recent 5-year period and there was an increase of 44 per cent in the tons produced. The fatality rate per million tons produced in 1906-1910, inclusive, was 5.89 and the similar rate for 1944-1948, inclusive, was 1.70; hence, the fatality rate per million tons of coal was reduced 71.1 per cent in the 1944-1948 period, as compared with the 1906-1910 period; and the people of the United States had the use of nearly 1,000,000,000 tons increased production of coal in 1944-1948, inclusive, with 7,763 fewer lives lost than in the 1906-1910 period.

In 1911, the mining industry as a whole was charged with 3,351 fatalities; careful estimates for 1948 place the total fatalities at about 1,225. And the output of the mines of the United States was far greater in 1948 than in 1911. In 1907, the coal mines of the U.S. produced approximately 147,000 tons per fatality, while the estimated production in 1948 is approximately 640,000 tons. In the period 1930-1948, many underground coal mines produced several million tons per fatality and one produced more than 7,000,000 tons without a fatality. One coal mining company had nearly 200 employees who had worked in and around coal mines more than 35 years without a lost-time accident, several of them having worked more than 50 years. One cement plant with an open-cut quarry operated over 12 years without a lost-time accident in about 3,580,000 man-hours, and produced about 7,260,000 barrels of cement during the period. One underground metal mine worked about 300 men a full year without a lost-time accident and produced about 780,000 tons of rock. One small underground coal mine worked over 30 years (from its beginning to its abandonment) without a single fatality in its aggregate production of more than 1,000,000 tons of coal. There are hundreds of other records of remarkable safety achievement in mining; these are available in the files of the Bureau of Mines and elsewhere.

Twice in the first half of the 20th century, the United States was confronted with an emergency

demanding maximum production of coal at a time when manpower was decidedly scarce. In the 3 years of World War I (1916-1918), coal production amounted to 1,920,000,000 tons, at a cost of the lives of 7,502 miners. In a similar 3-year period of stress in World War II (1944-1946), 1,910,000,000 tons of coal were made available at a loss of 3,351 lives. These two 3-year periods represent the largest production the coal industry of the U.S. has ever obtained in three consecutive years. The tonnage in both periods is essentially the same, but the number killed during the period 1944-1946, inclusive, was much less than half of the number sacrificed in the period 1916-1918 inclusive. The difference between the 7,502 killed in 1916-1918, inclusive, in mining virtually the same amount of coal as in the 1944-1946 period, when 3,351 men were killed, indicates a saving of 4,151 lives for the coal mining industry and the country at large. The saving was made at a time when the United States was confronted with the most critical shortage of manpower in its history.

The noncoal mines of the United States have also a notable record of decrease of fatal accident occurrence. In 1911, there were 695 fatalities and in 1945 approximately 112 in the noncoal mines; the fatality rate per thousand 300-day workers was 4.45 in 1911 and about 1.62 in 1945. This shows a reduction of 583 fatalities in comparing these two typical years and a decrease of 63.6 per cent in the fatality rate per thousand 300-day workers. The major disaster fire hazard in metal mines, which took an especially heavy toll of life from 1915 to 1925, has been practically eliminated.

Unquestionably, both coal and noncoal mines have done extremely well in their efforts to improve safety conditions for those engaged in mining work; this does not mean, however, that the ultimate in mine safety has been reached, since the industry still has about the highest accident rate of the major industrial occupations of the United States. However, much progress has been made and the foundation has been firmly laid for the continuance of the downward trend of mine accident occurrence, fatal and nonfatal, which started shortly after the creation of the Bureau of Mines. Mining is an inherently hazardous occupation and it is improbable that the accident rates will ever be brought as low as the average rate for the other major industries of the nation. While the irreducible minimum for mine accident occurrence is far from having been achieved, much progress has been made.

DANIEL HARRINGTON,
Former Chief, Health and Safety Division, U.S. Bureau of Mines.

MINE GAS. Many of the gases occurring in coal mines are of an explosive nature. The commonest of these is marsh gas, CH_4 , which is highly explosive when mixed with the right proportion of air. This mixture is known to miners as firedamp. Among other gases occurring in coal mines may be mentioned carbonic acid gas, CO_2 commonly known as chokedamp or blackdamp, and carbon monoxide, CO , known as whitedamp. Afterdamp is a gas found in mines after an explosion has occurred.

MINE PLANTERS. The mine planter service in time of peace is organized for instruction purposes. In time of war the vessels of

this service are assigned to the various coast defenses for service in planting mines. The vessels for this service are known as United States army mine planters, and when not assigned to coast artillery districts, coast defenses or to the Coast Artillery School, are under the control of the quartermaster-general of the army.

MINE RUN, Campaign of. During the Civil War, on 7 and 8 Nov. 1863 General Meade crossed the Rappahannock at Kelley's Ford and Rappahannock Station, and concentrated his army of 70,000 men in the vicinity of Brandy Station, General Lee, with 50,000 men, withdrawing beyond the Rapidan to an entrenched line, the left of which covered some of the fords of the river, the right being perpendicular to it and extending to Bartlett's Mill on Mine Run. On 26 November Meade began the Mine Run campaign by sending the First, Fifth and Second corps to cross the Rapidan at Culpeper Mine and Germanna fords, and the Third and Sixth corps to cross at Jacob's Mill, all five corps to converge upon the old turnpike and the plank-road near Robertson's Tavern, both leading to Orange Court House, and turn the right of Lee's position. An early start was made on the 26th, but owing to delay in some of the columns, all were halted for the night but a short distance beyond the river. The march was resumed at daylight of the 27th. The Second corps reached Robertson's Tavern at 10 A.M., to find itself in the presence of a considerable body of Ewell's corps which Lee had hastened there, and it was ordered to remain on the defensive, until the Third corps, followed by the Sixth, came up on the right. But the Third corps was delayed. Lee, on discovering Meade's movement, had promptly ordered Early, commanding Ewell's corps, to move to the right. Part of his command had reached Robertson's Tavern and confronted the Second corps, and Johnson's division was moving in the same direction when it came into collision with the Third corps, on Payne's Farm, and a battle ensued, lasting until dark. Both sides claimed the advantage, but the engagement resulted in a delay to Meade's operations, and, as he claims, the failure of his campaign. The Union loss was 125 killed, 747 wounded and 71 missing. Lee reported a Confederate loss of 545. The Second corps was severely engaged during the day, and advanced some distance beyond Robertson's Tavern. At night the First corps moved up to the support of the Second. The Fifth corps, which had supported Gregg's cavalry division in an engagement at Parker's store, on the Orange plank-road, was brought over to support the Second, and next morning the Third and Sixth corps came up on the right of the Second. On the 28th Meade advanced to the attack, but on driving in the Confederate pickets it was found that Ewell's corps had fallen back. Pursuit was made, the Second corps in advance, and after a march of two miles Ewell was found in position on the west side of Mine Run. A. P. Hill had come up and formed on Ewell's right, covering the Orange plank-road. The line was very strong, and on it were 150 guns. It was after dark when the Second, Sixth and First corps, with part of the Third, fronted this position. An examination of Lee's position convinced Meade that

there was no probability of success in an attack in his immediate front, and he determined to send General Warren, with his Second corps and a division of the Sixth, to feel for Lee's right flank and turn it if practicable. The 29th was spent in reconnoitring and demonstrations, while waiting for Warren's movement. Early in the morning of the 29th Warren started from Robertson's Tavern, crossed over to the plank-road, drove in the skirmishers of A. P. Hill's corps and late in the day came upon Hill's position across the road. Warren reported to Meade that the conditions were favorable for an attack, and personally assured him that he could carry everything before him. Meanwhile some of Sedgwick's division commanders had discovered weak points on Lee's left, no works being thrown up, and Meade ordered an attack for the morning of the 30th, the right and centre to open with artillery at 8 o'clock, at which time Warren was to make the main attack, and at 9 o'clock Sedgwick was to assault Lee's left with five divisions of the Fifth and Sixth corps. Two divisions of the Third corps were sent to Warren, thus increasing his command to six divisions of 26,000 men. The batteries on the right and centre opened a furious fire at 8 A.M. The skirmishers of the First and Third corps advanced across Mine Run and drove in those of the enemy, and Sedgwick was about to assault when Meade ordered him to desist. He had received a dispatch from Warren advising against an attack on Lee's right, as it could not succeed. During the night of the 29th Warren had made dispositions for an overwhelming assault, but on the morning of the 30th he saw on the heights before him a line of strong works thrown up over night, well filled with infantry, and heavy batteries covering the slope up which it was necessary to charge, and therefore he deemed successful attack impossible. Meade rode over to Warren, who proved unchangeable in opinion, and Meade tried to arrange for an attack later in the day, but found it impracticable. The armies remained confronting each other that day and the next, and on the night of 1 December Meade withdrew to his former position beyond the Rapidan. Lee followed part way on the 2d. The Union loss in the Mine Run campaign, 26 November to 2 December, was 173 killed, 1,099 wounded and 381 missing. The Confederate loss was 110 killed, 570 wounded and 65 missing. Consult 'Official Records' (Vol. XXIX); Humphreys, 'From Gettysburg to the Rapidan'; Pennypacker, 'Life of General Meade'; Wather, 'History of the Second Army Corps'; Powell, 'History of the Fifth Army Corps'; The Century Company's 'Battles and Leaders of the Civil War' (Vol. IV).

E. A. CARMAN.

MINE SURVEYING. See SURVEYING.

MINE-SWEEPING. Almost immediately upon the development of the mine itself came the development of measures for combating of mines. From the very first the mine was used as a weapon of offense and it became necessary to find some means of protection against it. As early as 1777, Bushnell, an American inventor, devised moving machines which were discharged in the Delaware River against British ships. These were later ridiculed in a ballad called 'The Battle of The Kegs.' Later in the

blockade of American harbors by the British in 1813, and in the Crimean War, nothing more useful seems to have been employed in the detection and destruction of mines than dragging for them with nets, etc.

During the American Civil War, however, mines began to be used on so large a scale and so effectively that it became necessary for the Northern States to adopt adequate measures for protection against them. The first idea was to creep for the cable connecting the torpedoes, in the hope that the creep would break the cable or explode the mines. Later, chains towed between two vessels were used in an attempt to seize the moorings of the mines, the latter being then raised and rendered harmless. These methods do not appear to have met with any great measure of success.

In 1863, Ericsson constructed his mine destroyer, which consisted mainly of a strong float attached to the forward part of the ship and extending well to the front of the bow. At the extreme front end of the float and several meters under the surface of the water was fixed an explosive charge of 700 pounds of powder. In front of the charge were rigged two timbers which, upon engaging an obstacle, closed upon each other as do the parts of a parallel ruler, thereby igniting the charge. The important feature of the invention was the air chamber placed directly in front of the charge. This gave way at the push of the explosion and allowed the full force to be sent forward against the obstacle, thereby protecting the float itself from any damage. A large number of these mine-catchers were produced at that time, but for some reason or other no further use appears to have been made of the invention.

Mines had been used mostly as a weapon of defense for the protection of coastal localities and the blocking of channels, until the outbreak of the Russo-Japanese War. During this war, however, it became the custom to strew broadcast great numbers of unanchored mines, and it became necessary to find a means of searching out the location of these mines and destroying them.

The oldest method of protecting warships against mines was in the use of less valuable ships as exploders. One or more of these would go ahead of the battleships, in the hope of striking and exploding enough mines to make a breach in the minefield. The exploder had to be of draught at least equal to that of the ship to be protected, and also had to be so constructed that after the explosion of the first mine the engines would still drive it ahead to the destruction of others. To meet the latter requirement, the ship had to have its engines located aft, as in the case of tank steamers. Of course, the exploder was inevitably sacrificed, so that the method was a very expensive one. Other objections were that even a number of these ships might go through a field and miss mines that would sink the ships to be protected, and that success in the exploder's mission meant sure death to her crew.

For ways and means of detecting and destroying mines during World Wars I and II see the section on *Minesweeping* in the article on SUBMARINE MINES, MINELAYING, AND MINE-SWEEPING.

MINE WORKERS OF AMERICA, United. See UNITED MINE WORKERS OF AMERICA.

MINEOLA, mīn-ē-ō'lā, village, New York, and Nassau County seat, on Long Island, eight miles east-northeast of Jamaica, Long Island, and 20 miles east of New York City. It is at the junction of the main line and Oyster Bay branch of the Long Island Rail Road. The altitude is 106 feet above sea level. To the east are the fashionable villages of Westbury and Old Westbury.

The region is largely devoted to aviation. Here is located Mitchel Air Force Base (U.S. Army) named for John Purroy Mitchel, mayor of New York from 1914-1917, who was killed in an airplane accident in 1918. Roosevelt Field is nearby. Industries include the manufacture of clothing, radio parts, food products, machinery, and wood and metal products. Mineola is also a commercial center for the surrounding potato and truck farming area. The village was incorporated in 1906 and is governed by a mayor and board of trustees. Pop. (1950) 14,831.

MINEOLA, city, Texas, in Wood County; altitude 414 feet above sea level; 80 miles east of Dallas. It is served by the Texas and Pacific, the Missouri-Kansas & Texas, and the International and Great Northern railroads. Mineola is a busy transportation, trading, and produce marketing center for the surrounding area. Manufactures include tile, lumber products, cement blocks, and mattresses.

Founded in 1873, it was incorporated in 1913, and has a mayor-alderman form of government. Pop. (1950) 3,626.

MINER, Jack (John Thomas), Canadian naturalist, author, and lecturer: b. Dover Center, near Cleveland, Ohio, April 10, 1865; d. Kingsville, Ontario, Canada, Nov. 3, 1944. In 1878 he moved to Canada with his parents who settled in Essex County, Ontario.

On his farm at Kingsville, Ontario, he established a bird sanctuary in 1904 which soon achieved world-wide fame and Miner became known as one of the chief bird conservationists of North America. In 1931, his friends, in appreciation of his pioneering work, established the Jack Miner Migratory Bird Foundation for the purpose of continuing the work of his bird sanctuary.

He lectured once or twice on conservation of bird life in every town and city of Canada with a population of 2,000 or more. He wrote: *Jack Miner on Current Topics* (1929); *Jack Miner and the Birds* (1934).

MINER, Roy Waldo, American curator: b. North Adams, Mass., Feb. 24, 1875. He was graduated from Williams College in 1897; from the General Theological Seminary in 1900; and took his Ph.D. at Columbia University in 1923. He was a master in Latin and biology at Berkeley School, 1900-1904; was associate headmaster, Kelvin School, N. Y., 1904-1905; and in the latter year became assistant curator of invertebrate zoology at the American Museum of Natural History. He was made associate curator in 1917, and in 1922 became curator of marine life in the same institution. He was a member of the International Fisheries Conference in Washington in 1909; and has participated in numerous scientific expeditions. His publications include *Animals of the Wharf Piles*, *Field Book of Sea Shore Life*, *Diving in Coral Gardens*.

The Kingdom of the Tides, A Transplanted Coral Reef.

MINER, William Harvey, American journalist and author: b. New Haven, Conn., March 1, 1877. He took a special literary course at Yale University in 1896 and was graduated at Columbian (now George Washington) University in 1899. For a time he was a staff member of the Lowell (Mass.) Mail. He traveled extensively in the Middle and Far West, in Canada and in Europe and published *George Catlin, a Memoir* (1900); *The Lewis and Clark Expedition* (1901); *Daniel Boone* (1901); *The Seafaring Club* (1903); *The Beginnings of American Science* (1906); *Savage and Chatterton* (1907); *Life of Charles Churchill* (1907); *The Iowa Indians* (1911); *History of the American Indians, North of Mexico* (1917). Died Feb. 6, 1934.

MINERAL ACIDS, Toxicology of. Poisoning by ingestion of sulphuric acid causes pain in mouth, nose, throat and epigastrium; bloody saliva; vomiting, bloody diarrhoea; feeble pulse; cold, damp surface; and collapse. Ulceration of stomach and larynx may occur and if the patient survives, a form of Bright's disease follows quickly. The antidote is any available alkali as soap, chalk, magnesia or whitewash, scraped, perhaps, from a wall. Hydrochloric acid (q.v.) causes similar though possibly less severe symptoms and recovery is more often possible. The antidotes are the same. Nitric acid (q.v.) exceeds sulphuric in the violence of the symptoms caused, with sudden death. Instead of black sloughs in the mouth, oesophagus and stomach, such as occur in sulphuric acid poisoning, in nitric acid intoxication yellow sloughs and stains are found after death. Nitromuriatic acid poisoning resembles poisoning by nitric acid in symptoms and pathological results. Similar yellow staining is found. The antidotes are alkalis. Phosphoric acid (q.v.) is not corrosive to animal tissues, though the glacial acid coagulates albumen. Its antidote is any alkali at hand, but its effects are not highly dangerous. See also **ACIDS**; **TOXICOLOGY**.

MINERAL COLORS, inorganic materials in the making of paint. They date as far back (or farther) in the history of coloring materials as organic materials, the paints used by primitive peoples for personal decoration being more commonly of this class. In Greek painting the main sources of coloring matter were carbonate of chalk for whites; red and yellow ochres; and carbon. Apparently these same colors were used in Egyptian wall-painting. The range was much widened at the beginning of the Christian era at Rome and the chemical activity of the last century has added largely to the mineral sources of colors. These may be roughly classified as follows: Whites from calcium, for example, carbonate and sulphate; from barium, for example, sulphate (natural and artificial) and tungstate; from lead, for example, carbonate, hydrocarbonate, sulphate, ammonite, tungstate; from zinc, the oxide, oxychlorine, etc.; from silicium and talc; from antimony; and from the hyponitrate of bismuth. Reds are based on iron, as sesquioxide and red ochre; on mercury; on lead, as minium; on arsenic, as arseniate of cobalt; on antimony and on gold. The greatest source of yellows is

chromic acid derivatives; next the lead colors; and then the ochres and other minor sources. Blues are derived from copper (hydrate, arseniate, carbonate), from cobalt (aluminates and silicates) and from iron (phosphates, etc.); greens from chrome (notably sesquioxide), copper, manganese, etc.; and blacks mostly from carbons. An excellent handbook of the subject is Perret, *Couleurs Minérales* (1902).

MINERAL DRESSING. See **MINING—Mineral Dressing**.

MINERAL PHOSPHATES. See **FERTILIZERS—Phosphates**.

MINERAL PIGMENTS. See **MINERAL PRODUCTION OF THE UNITED STATES**.

MINERAL POINT, Wis., city in Iowa County; alt. 944 feet; about 45m. SW. of Madison, on the Chicago, Milwaukee, St. Paul and Pacific Railroad. The great mineral deposits which gave the city its name were discovered in 1828, and boom days followed. By 1836 the population numbered 2,000. When the lead mines began to dwindle, zinc mining boomed, and when mining generally declined, the town turned to retailing, shipping, etc. Pop. (1950) 2,284.

MINERAL PRODUCTION OF THE UNITED STATES. The production of minerals, both metallic and nonmetallic, is one of the most important industries of the United States, and has been since early colonial days. An exploratory expedition sent out from England by Sir Walter Raleigh and commanded by Ralph Lane reported the discovery of iron ore in 1585 in the area that is now North Carolina, and the search for minerals, especially iron ore, was one of the functions of many of the early explorations. Attempts were made to establish the mining and smelting of iron ore at Felling Creek, Va., as early as 1619, but the first successful project was at Saugus Creek, Mass., in 1645. This date marks the beginning of an established commercial mineral production in the territory that was later to become the United States, although from the establishment of the earliest settlements, local artisans had mined and used such products as stone, sand, gravel, and clay. From these early beginnings the mineral production has grown with the passing years, at first slowly, and then more rapidly, with the bulk of the development in the past 100 years.

With the exception of products for purely local consumption (such as stone, sand, gravel, and clay), as distinguished from products for general commercial distribution, the mineral production of the United States prior to 1850 was largely confined to coal and iron. Lead had been produced on a small scale, and still smaller amounts of copper, gold and silver. But it was not until after the close of the Civil War that mineral production began the advances that pyramided so rapidly that the spectacular eventually became commonplace in the industry. By 1880, the first year for which full official records are available, the value of the total mineral production of the United States had grown to \$367,000,000, and the closing years of the 19th century saw the valuation pass the billion dollar mark—a feat first accomplished in 1899. At the time, this was considered quite an accomplishment, but pro-

MINERAL PRODUCTION OF THE UNITED STATES

duction continued to expand so rapidly that in 1917, only 18 years later, the leading state (Pennsylvania) passed the billion dollar mark by a margin of over a third. Texas joined the "billion dollar club" in 1944, and in 1947, West Virginia was bidding for admission in the near future, and California was not far behind. In the meantime, Pennsylvania had passed the two billion dollar mark, and the national total had passed 12 billions with a margin larger than the 1880 total.

Before entering into any discussion of the growing magnitude of the mineral production, attention should first be centered on the fact that there is no means of securing any exact measure of that magnitude. One can add tons of coal and of iron ore, bauxite, stone, and other similar products, and secure a figure that is a real measure of the magnitude of production. One can convert barrels of petroleum and even cubic feet of natural gas into an approximate equivalent tonnage and include these figures in the total without causing serious discrepancies. However, if one includes the corresponding tonnage equivalents of ounces of gold and silver, the totals lose all real significance as a measure of magnitude, for between a ton of gold and a ton of coal the real measure is one of value, rather than of weight. On the other hand, there are also difficulties in the use of value as a basis of comparison. Shall we take the value of iron ore at the mine, or the value of the pig iron produced from the ore? For the purpose with which we are concerned, the ore seems more logical, but when we come to copper, gold, silver, and many of the other metals, there is little basis for determining the valuation of the ore at the mine. Few such ores are sold in the open market, as most of them are treated by the producer, who sells the resultant metal, rather than the ore. In determining the values of such products, it is therefore necessary to use the market value of the recoverable metal in the ore. Since such a valuation includes, in the result, the cost of transportation and of smelting, the figures are appreciably higher than the value of the ore at the mine, but are still usable for general comparison purposes, lacking a better basis.

Another difficulty encountered in using value as a basis for comparison is that changes in the physical volume of the products are so often masked by changing prices of the product. Hence, the total value of mineral production as used in this discussion can be considered only an approximate indicator and not a true measure of the physical volume of the products concerned. Commodity prices have also made extensive advances since 1880, and the fact that the 1948 valuation is 42 times that of 1880 does not mean that the tonnage output has increased in the same proportion. In normal times, the values for successive years are determined more by volume of output than by price, but in years such as 1947 and 1948, and to a lesser degree in 1920, the values are likely to represent price advances more than increased output. Likewise, during the depression years, prices and output were both decreasing, thus intensifying the decline as expressed in dollar value. On the other hand, one must not lose sight of the fact that as demand and production increased, many production costs were lowered, and the output was going up while prices were going down.

The annual records of the total value of min-

eral production in the United States, as compiled first by the United States Geological Survey and later by the United States Bureau of Mines, from 1880 to 1948, are shown in the accompanying Table 1, with totals broken down into the three major subheads—*Metallics*, *Fuels*, and *Non-metallics*.

Table 1.—VALUE OF MINERAL PRODUCTS OF THE UNITED STATES, 1880-1948

(millions of dollars)

Year	Metallics	Fuels	Non-metallics	Total
1880....	\$190.9	\$120.2	\$56.3	\$367.5

Total....	\$66,410.0	\$130,498.3	\$38,360.5	

Careful study indicates that the development of mineral production, as indicated by total value of the products, has been four distinct economic periods. The first of these periods, beginning in earlier years not covered by the data, and extending to 1897, exhibited a general but moderate upward trend that was intensified to an appreciable degree during 1898-1913. After the sharp increase developed by World War I, the total fluctuated from year to year, partly due to varying output, and partly to changing prices, but the slope of the general trend had dropped back almost to horizontal, and turned abruptly downward during the depression years. Then, just as production was coming back to normal after the depression, output was stimulated by World War II and the sharply rising trend that had been established during the recovery from the depression was continued on through the war period, and was even somewhat accentuated during the early postwar years. This period from 1932 to 1948 shows a rate of increase in total valuation that is not paralleled in any part of the previous record.

Before leaving the subject of value of mineral production, some attention should be given to a comparison of the values contributed to the totals by each of the three major subdivisions of the mineral industry. Up to the beginning of World War I, metallics and fuels were in constant competition for first place; for a time, one would be in the lead, and then the other. Although metallics led in more years, such margins of surplus as fell to fuels were larger, so that at the end of 1914 the two valuations, totaled since 1880, were almost identical, each having 40 per cent of the grand total since 1880. However, since 1917, fuels have been definitely in the lead, due chiefly to the steady expansion of petroleum production.

Nonmetallic minerals have, in general, ranked low in value in comparison with metallics and fuels, because many of the largest tonnage items, like crushed stone, sand, and gravel, are low-priced items, but from 1921 to 1934, nonmetallics made a better showing than metallics. In 1948, nonmetallics contributed 11 per cent of the grand total of value, as against 65 per cent for fuels, and 24 per cent for metallics.

In Table 2, the principal mineral products of the United States are listed according to the state of origin, and arranged roughly in decreasing order of value of the 1947 output; also the values of the state outputs in the more important years, according to the reports of the United States Geological Survey and the Bureau of Mines. Lack of space prevents the showing of values for more than a few years; hence, the years selected are those which show the scope of the changes that have occurred—that is, 1918, the peak year of World War I; 1926, the peak year of the postwar boom period; 1932, the low year of the depression period; 1939, the last year before production was affected by the World War II; 1944, the peak year of World War II; and postwar 1947. The data for these years show the extremes of fluctuations in mineral production as affected by the trend of current events.

Mineral Products.—The following paragraphs list the various mineral products of the United States, with brief notes on major uses and sources by states of origin. In general, states are listed in the order of decreasing output as of 1947, but in some cases, 1947 data are not available, and the order is based on earlier data. Usually no attempt is made to list all states contributing to the output, but only those responsible for the major portion of the total.

Aluminum.—Metallic aluminum is recovered from bauxite of domestic and foreign origin, imports being greater than domestic output. It is used in the making of lightweight machinery, equipment and utensils; in automotive and aircraft construction; and in electrical conductors and building construction. The leading producing states are Washington, Tennessee, New York, and Oregon, the shift of production to the western states being a wartime development.

Antimony.—Metallic antimony is produced more extensively from imported ores than from domestic production, which originates chiefly in Idaho, Nevada, Washington, and Alaska. The metal is used mainly as a hardener for lead, in storage batteries, bearing metals, type metal, and numerous minor uses. Some antimony is also recovered in the smelting of antimonial lead ores. Much ore also goes into the oxide, for use in ceramic frits and enamels, paints, flame-proofing textiles, and minor uses. Smelters are located in Texas, California, and Idaho.

Arsenic.—Used in making insecticides, fungicides, drugs, chemicals, and dyes, arsenic is a byproduct recovered in the smelting of copper ores. The domestic output is largely in Montana and Utah, and must be supplemented by imports.

Asbestos.—Used as a heat and electrical insulator, and in building materials, it is mined in small quantities in several states, chiefly Vermont, Arizona, North Carolina, and Georgia, but only to the extent of about 3 per cent of the demand. The bulk of the asbestos consumed is imported, mainly from Canada.

Asphalt.—The bulk of the asphalt output is a byproduct in the refining of petroleum and is used as a paving material. Small amounts of the natural asphalts, gilsonite and wurtzilite, are mined in Utah, and considerable tonnages of bituminous rock are produced in Texas, Kentucky, and Oklahoma, with smaller amounts in several other states.

Barite.—Formerly used principally as a white pigment and filler in paints, barite became more important as a drilling mud in gas and oil wells. Smaller amounts are used in the glass and rubber industries. Domestic production is chiefly in Arkansas, Missouri, Georgia, Nevada, and Tennessee.

Bauxite.—The major use of bauxite is as an ore for the production of aluminum, with smaller amounts going into artificial abrasives and aluminum salts for industrial use. The major producing states are Arkansas, Alabama, and Georgia, but imports exceed the domestic output.

Bentonite.—Technically classed as a type of clay, bentonite is produced mainly in Wyoming, South Dakota, and Texas. Its uses are specialized, and differ widely from the usual uses of clay; these specialized applications include the bonding of foundry sand, filtering and decolorizing mineral and vegetable oils, and drilling mud for gas and oil wells, besides a number of minor uses.

Beryllium.—Used mainly in the production of alloys with copper and nickel, but chiefly copper. Domestic ores from South Dakota, New Hampshire, Connecticut, Colorado, and Maine supply only a fraction of the demand.

Bismuth.—The production of alloys with low melting points now takes a considerable proportion of the bismuth output. Supplies are largely imported, and the domestic output is mostly as a byproduct in the treatment of ores of other metals, especially lead and copper.

Boron Minerals.—Formerly obtained almost entirely from kernite, also known as rasorite, the commercial boron minerals now also include ulexite, colemanite, and boric acid, as well as dissolved borates in saline lake deposits. Borates are used extensively in ceramics, chiefly enamel coatings for iron and steel, and for certain types of glass. They are used to a lesser extent in the making of soaps; in dyeing and tanning; and as a larvacide, preservative, disinfectant, and a constituent in fertilizers. California supplies the entire domestic output, with a large surplus for export.

Bromine.—Formerly recovered only from the salt brines of wells in Michigan, Ohio, West Virginia, and California, the bulk of the bromine output is now obtained directly from sea water at plants in Texas. The major use is in the production of tetraethyl lead, the antiknock compound used in gasoline, but smaller amounts go into chemicals for industrial and medical use.

Cadmium.—Used as a protective coating for steel, in bearing metal for high speed engines, and in alloys for various other purposes, cadmium is recovered almost entirely as a byproduct from the treatment of zinc, lead and copper ores. Certain of the compounds are used as pigments.

Calcium and Magnesium Chlorides.—Used in stabilizing road surfaces, in cement mixes, in making heavy solutions for coal washing plants, and in melting

MINERAL PRODUCTION OF THE UNITED STATES

Table 2—PRINCIPAL MINERAL PRODUCTS AND VALUES OF OUTPUT FOR STATES OF THE UNITED STATES¹

State	Rank (1947)	Per cent of total U.S. value (1947)	Principal mineral products roughly in order of value (1947)	Value of principal mineral products for various years (1918-1947) (thousands of dollars)

¹ In this table iron ore, not pig iron, is taken as the basis of iron valuation. The rank of natural gas in this table (in contrast to Table 1) is based on value at wells rather than value at points of delivery.

- snow and ice on streets and roads. Production is mainly from well brines in Michigan, West Virginia, and California.
- Cement.**—Limestone and other raw mineral materials for the making of cement are available in all parts of the country, but in some locations slag from iron furnaces is used as a substitute. Cement production is highest in Pennsylvania, California, Texas, New York, Michigan, Ohio, Alabama, Missouri, and Kansas.
- Chromite.**—Used mainly as an ore for the production of chromium, but also as a refractory and a source of chromium chemicals. The supply is almost entirely imported; normally the small domestic output is usually confined to California, but there has been production in Montana, Oregon, and Alaska.
- Chromium.**—The metal is an important constituent in alloy steels, particularly of the stainless type, and in nonferrous alloys requiring high electrical resistance, high hardness, and resistance to oxidation and corrosion. (For the ore, see the article CHROMITE.)
- Clays.**—Clay for some type of use is listed in the mineral production of every state except Rhode Island. The ordinary types of clay are most widely distributed, while the special types, fire clay, kaolin and ball clay, are more restricted, in the order named. (For details, see the article on CLAY.)
- Coal.**—Coal is produced in 28 states and Alaska, but the four leading states, Pennsylvania, West Virginia, Kentucky, and Illinois, supply more than three quarters of the total, and the next four, Ohio, Indiana, Virginia, and Alabama, another 15 per cent. (See the article on COAL.)
- Coke.**—Used mainly as a fuel in the production of pig iron, as a domestic fuel, in gas manufacture, and in iron foundries; other industrial uses account for about a quarter of the total. About 90 per cent of the coke made from coal is produced in byproduct ovens, and most of the remainder in beehive ovens. Small amounts are made in gas retorts and special types of ovens. Relatively little coke is made in the distillation of petroleum or tar. Coke production is concentrated most heavily in the states consuming the product, rather than those producing the coal, and so follows the pattern of distribution of pig iron production.
- Columbium.**—Used mainly as an alloying agent in stainless steel, to improve corrosion resistance, columbium is chiefly imported. There has been a small domestic output of tantalum-columbium concentrates in New Mexico, South Dakota, North Carolina, and Virginia.
- Copper.** Used in electrical work as a conductor, and in a wide variety of alloys, of which the most important are brass and bronze. The chief producing states are Arizona, Utah, New Mexico, Montana, and Michigan.
- Diatomite.**—Used as a filter aid, filler, insulating material, and abrasive. Production is mainly in California, Oregon, Nevada, and Washington.
- Dolomite.**—Sources of dolomite are widely distributed in many states. It is used as a refractory and as a source of magnesia and magnesium.
- Emery.**—Used as an abrasive, but artificial abrasives have largely replaced emery in industry. Domestic production is confined to a deposit near Peekskill, N. Y., with smaller amounts imported.
- Feldspar.**—Used for the most part in the making of glass, pottery, and enamels, with small amounts going into soaps and cleansers, where it serves as a mild abrasive. Domestic production is spread over a dozen or more states, with North Carolina, South Dakota, Colorado, and Virginia leading. Relatively small amounts are imported.
- Fluorspar.**—Used in the manufacture of steel, cast iron, hydrofluoric acid, glass and enamels. Clear crystals are used in optical instruments. The major producing states are Illinois, Kentucky, Colorado, and New Mexico.
- Fuller's Earth.**—A specialized type of clay, with specialized applications that differ widely from the usual uses of clay. The bulk of the output is used in the filtering and decolorizing of vegetable and mineral oils, but there is an increasing demand for it as an absorbent, to take up spilled oils and other liquids. The leading producing states are Florida, Georgia, Illinois, and Texas.
- Garnet.**—Used as an abrasive, where a material harder than quartz is required. The finer crystals are used as gems. Abrasive material is found in New York, Idaho, New Hampshire, and North Carolina, with commercial production limited to the first two.
- Gem Stones.**—No precious stones are recovered commercially in the United States, though deposits of sapphires are known to exist in Montana, and of diamonds in Arkansas. A wide variety of semiprecious and ornamental stones is produced; mostly in the Rocky Mountain and Coastal areas but to some extent in the eastern states. Most important of these stones are nephrite, agate, turquoise, and variscite.
- Gold.**—Although the bulk of the gold output is absorbed by the world's monetary system, appreciable amounts are used in jewelry, the arts, and industry. The chief producing states are California, Utah, South Dakota, Alaska, Arizona, Montana, and Nevada, but a large proportion of the output is obtained as a byproduct in the treatment of ores of other metals, rather than being mined primarily as a gold ore.
- Graphite.**—While the bulk of the graphite supply is imported, domestic deposits have been worked in Alabama, Texas, Pennsylvania and Rhode Island. Graphite is used in making crucibles and other refractory shapes, lubricants, dry batteries, and lead pencils. Artificial graphite is made in large quantities in the electric furnace, but mostly for uses for which natural graphite is not applicable.
- Gravel.**—Production of gravel is widely distributed and is reported from all states, but more than half the total is produced in 10 states—California, Wisconsin, Michigan, Illinois, Ohio, Pennsylvania, Iowa, Texas, Indiana, and New York. It is used largely in building and road construction.
- Greensand.**—See MARLS.
- Grinding Pebbles.**—Used in grinding ores and other products in tube mills, grinding pebbles are produced in Minnesota, North Carolina, and Wisconsin.
- Gypsum.**—Used in making building plaster and board shapes for building construction, gypsum as plaster of paris has numerous other uses. Ranking states, in order of production, are Michigan, New York, Texas, California, Iowa, and Nevada.
- Helium.**—Used in the inflation of balloons; in arc welding and other metallurgical operations requiring an inert atmosphere; in medicine to produce a special breathing atmosphere; as a tracer gas in oil and gas reservoirs; and in the production of low temperatures. The entire world production is in the United States, from natural gas reservoirs in Texas, New Mexico, Colorado, and Kansas. Normally, commercial production is limited to Texas. Production is held as a government monopoly, due to the strategic importance of helium in wartime.
- Iodine.**—Waste oil-well brines in California furnish the domestic iodine output, which is supplemented by imports from Chile. Iodine is used in medicine, industrial chemicals, fertilizers, and foodstuffs.
- Iron Ore.**—Minnesota produces about two thirds of the total output of iron ore, followed by Michigan, Alabama, Utah, and Wisconsin. This ore is used mainly in the production of pig iron and steel.
- Kyanite Minerals.**—Used in refractories. Kyanite occurs in Virginia, California, North Carolina, and Georgia; andalusite, in California and Nevada; and sillimanite, in Georgia and South Carolina. Domestic output is limited.
- Lead.**—Used in making paint pigments, storage batteries, cable coverings, plumbing and construction supplies, solder, bearing metals, and other alloys. About 10 per cent of the domestic consumption goes into antiknock compounds for automotive gasoline. Lead ore is produced chiefly in Missouri, Idaho, Utah, Arizona, Colorado, and Oklahoma.
- Lime and Limestone.**—Large quantities of lime, made by burning limestone, are used in the building industry, and increasing amounts are going into agricultural and industrial uses. Another extensive use is in the making of cement. (Limestone used as such, and not after conversion into some other product, is covered under the heading Stone.) Limestone production is reported from 44 states, Alaska, Hawaii, and Puerto Rico, but about two thirds of the total comes from 10 states—Ohio, Pennsylvania, Illinois, Michigan, New York, Virginia, Missouri, Indiana, Iowa, and Tennessee.
- Lithium Minerals.**—Used in the production of chemical compounds for specialized industrial and scientific use. Lepidolite occurs in Colorado, South Dakota, and New Mexico; spodumene, in North Carolina, and South Dakota; and amblygonite, in South Dakota. However, the direct mineral output from these sources is exceeded by the recovery of lithium salts as a byproduct from the potash operations at Searles Lake, Calif.
- Magnesite.**—Used as a refractory in steel and other high-temperature furnaces, and as a source of magnesia and magnesium. The mining of magnesite is confined to Washington, but magnesia may also be produced from brucite, dolomite, well brines, sea water bitterns and raw sea water.
- Magnesium.**—Used in airplane construction and other applications where light weight is a controlling factor. Possible raw materials include magnesite, aluminite, brucite, natural brines, and sea water.
- Manganese.**—Used as a deoxidizer in the making of

- ordinary steels, and as a constituent in many alloy steels and nonferrous alloys. The ore supply is mainly imported, but there is a limited domestic production in Montana, New Mexico, Arkansas, Arizona, and Washington.
- Marls.**—Greensand, once used considerably in agriculture as a source of potash, is now chiefly employed as a water softener, with production limited to New Jersey. Calcareous marls are produced in Virginia, Indiana, West Virginia, and Minnesota.
- Mercury or Quicksilver.**—Used in making pharmaceuticals, disinfectants, catalysts, fulminates, and dental alloys, and in a wide variety of electrical, scientific, and industrial control apparatus. Domestic output from California, Nevada, Oregon, Idaho, Alaska, Arizona, and Texas is supplemented by imports.
- Mica.**—In sheet or film form, mica is used as an electrical insulator. Scrap mica is ground and used in roofing materials, paints, rubber, wallpaper, and plastics. The domestic output of sheet mica, in North Carolina, South Dakota, Georgia, Maine, New Hampshire, Connecticut and other minor states, covers only a fraction of the demand, most of which must be supplied from imports. The supply of ground mica from scrap is supplemented by byproduct recoveries from kaolin and feldspar operations.
- Millstones.**—Natural grindstones for flour milling have largely gone out of use, but small tonnages of millstones and chaser stones are still quarried in North Carolina, New York, and Virginia.
- Mineral Pigments.**—These include ocher, umber, sienna, and other natural pigments with colors ranging from yellow through brown and red to black, in which some form of iron oxide is the coloring agent. The chief producing states are Pennsylvania, Illinois, New Jersey, and Virginia.
- Mineral Waters.**—Waters from mineral springs are bottled and shipped in most states, but production is no longer reported.
- Molybdenum.**—Used in making alloy steels and cast irons, and in high temperature alloys for use in jet engines and turbosuperchargers. The United States output usually accounts for about 80 per cent of the world total. Recovery from primary ores mined in Colorado and New Mexico is supplemented by concentrates recovered as a byproduct in processing copper ores in Utah, New Mexico, Arizona, Nevada, and California, and from tungsten ores in California.
- Monazite.**—A source of thorium, used in making gas mantles and refractory crucibles, and of cerium for pyrophoric alloys. The thorium content has lately become a factor in the development of fissionable materials. Formerly produced in North and South Carolina, domestic monazite recovery was discontinued after 1917, and supplies were obtained from imports. In 1948, commercial production was again started, this time in Idaho.
- Natural Gas.**—Used as a fuel, as a source of natural gasoline, and as a raw material in the synthesis of industrial chemicals. Production is reported from 26 states, two thirds of which is from gas wells and one third from oil wells. About half the total output is in Texas, and another third in Louisiana, California, and Oklahoma. Of the total, two thirds is marketed, and of the remainder, about half is returned to the ground and half is lost or wasted.
- Natural Gasoline.**—Most of the natural gas output is treated before use for the recovery of the small percentage of gasoline vapor it contains.
- Nickel.**—Used in making alloy steels and cast irons, nonferrous alloys, and in electroplating. The demand is met almost entirely from imports, the domestic output being limited to byproduct recovery in the electrolytic refining of copper.
- Olivine.**—Used in refractories for high temperature furnaces, and is also a possible source of metallic magnesium. Production is confined to North Carolina.
- Peat.**—In the United States, peat is not used as a fuel, but mainly as a soil conditioner, as litter for barns and poultry yards, and as a packing material. Production has been reported from 20 states, the more important of which are Florida, New Jersey, Ohio, Illinois, Maine, and Michigan.
- Perlite.**—Used, after expanding by heat, as a lightweight aggregate, heat insulation, and poultry litter. It is produced in Arizona, Oregon, and Nevada.
- Petroleum.**—Used as a source of gasoline, kerosene, lubricating and fuel oils. Production is distributed over 23 states, with nearly 80 per cent of the total from Texas, California, Louisiana, and Oklahoma.
- Petroleum Gases.**—The butane and propane content of the distillation products of petroleum are condensed under pressure and used for domestic and industrial heating, and as a raw material in the production of synthetic rubber and chemicals.
- Phosphate Rock.**—Used directly as a constituent of fertilizers, and as a raw material for the production of superphosphates and phosphoric acid. The chief producing states are Florida, Tennessee, Idaho, and Montana, supply the domestic demand, with a considerable surplus for export.
- Pig Iron.**—Used in making cast iron and steel. The chief producing states are Pennsylvania, Ohio, Indiana, Illinois, Alabama, New York, Maryland, Michigan, and West Virginia.
- Platinum.**—Used in chemical and electrical apparatus, dental and medical equipment, jewelry and the arts. The supply is largely imported, domestic production being limited to Alaska, California, and Oregon, plus byproduct recoveries in the electrolytic refining of copper and gold.
- Potash.**—Used in making fertilizers and industrial chemicals. Although formerly practically entirely dependent on imports, the United States has built up a self-sufficient domestic production, with a moderate surplus for export. The sources differ greatly. The bulk of the output is from natural salts mined in New Mexico; the California output is from natural brines at Searles Lake; Utah also utilizes lake brines as well as alunite; in Michigan, natural-well brines have been used, and in Maryland, potash has been recovered as a byproduct from cement kiln flue dust.
- Precious Stones.**—See *Gem Stones*.
- Pumice.**—The former predominant use of pumice in cleaning and scouring powders and as a mild abrasive has become secondary to its use in lightweight concrete aggregates and acoustic plasters. Production has also shifted, from Kansas and Nebraska to California, Idaho, New Mexico, Oregon, and Washington.
- Pyrite.**—Used as a source of sulphur, for making sulphuric acid, and of iron oxide. Production centers largely in Tennessee, California, Virginia, Montana, New York, and Wisconsin, but other states have incidental byproduct recoveries in the mining of coal. The domestic output is supplemented by imports, and in addition, considerable amounts of acid are made from sulphur gases produced in the roastings of sulphur-bearing ores of copper, lead, and zinc.
- Salt.** Though more widely known for its use in the seasoning and preservation of foods, the greater portion of the salt output is a raw material for industrial processes. It is mined as rock salt or recovered by evaporation of salt-well brines or the waters of salt lakes or the sea. The chief producing states are Michigan, Ohio, New York, Louisiana, Texas, Kansas, and California, which account for about 95 per cent of the total output.
- Sand.**—Used in building and paving construction, as an abrasive, refractory, filter medium, and railroad ballast, as well as in the making of glass and of molds for casting metals. Production of some type of sand is reported from all states, but over half of the output originates in seven states—California, New York, Illinois, Ohio, Texas, Michigan, and Pennsylvania. Crushed sandstone and quartz are also used in many of the same applications as sand, especially in ceramics and abrasives.
- Selenium.**—Used, curiously enough, both as a coloring agent and as a decolorizer for glass; in making rectifiers for alternating electric current; in compounding rubber; making colored pigments; and as an addition to stainless steels and copper alloys to improve machineability. The entire output is a byproduct recovered in the electrolytic refining of copper.
- Sharpening Stones.**—Natural grindstones are quarried in Ohio and West Virginia; oilstones, in Arkansas; rubbing stones and whetstones, in Arkansas, Ohio, and Indiana; and scythe stones, in New Hampshire and Ohio.
- Silver.**—Used in coinage, jewelry, the arts, and numerous industrial applications. Silver is produced only to a limited degree from ores mined primarily for their silver content, the bulk of the output being recovered in the treatment of ores in which silver is associated with other metals, especially gold, copper, lead, and zinc. The domestic output comes mainly from Idaho, Utah, Montana, Arizona, Colorado, California, and Nevada.
- Slate.**—Used for roofing and paving, school blackboards, electrical insulation, and flagstones. Ground to granules or flour, slate is used to surface roofing materials and as a filler. Production is largely confined to Pennsylvania, Vermont, New York, Georgia, and Virginia.
- Stone, Crushed.**—Used in concrete, paving, railroad ballast, as well as specific uses for certain types of stone. Crushed limestone has uses not open to other varieties of stone, as metallurgical flux, soil conditioner, and in the production of cement, lime, alkalis, calcium carbide, glass, and sugar. Production is widely scattered, and varies greatly with the type of rock.
- Stone, Dimension.**—The chief building stones used in

the United States, and the states from which the bulk of the output comes are: Limestone—Indiana, Texas, and Wisconsin; Granite—Georgia, Vermont, Maryland, and Pennsylvania; Sandstone—Ohio, Pennsylvania, and New York; Marble—Georgia and Tennessee; Basalt—Pennsylvania.

Strontium Minerals.—Used in pyrotechnics, especially signal flares and fireworks, to produce a red flame. There is a small domestic production in California, Colorado, New Mexico, and Texas, but the bulk of the supply is imported.

Sulphur.—Used in the production of sulphuric acid and other chemicals, as well as in fertilizers, insecticides, pulp and paper, explosives, dyes and coal-tar products, rubber, paint and varnish. The bulk of the output is crude sulphur, from Texas and Louisiana, but small amounts of sulphur ores have been mined in California, Colorado, Nevada, and Utah. The domestic supply exceeds the consumption demand, and a considerable proportion of the output is exported.

Talc.—Used in the paint, rubber, roofing, ceramic, and paper industries, as well as in toilet preparations and insecticides. Ground soapstone, an impure form of talc, and the closely related mineral pyrophyllite may be substituted for talc in many of its uses. The chief producing states are New York, North Carolina, California, Vermont, and Georgia.

Tantalum. Used as a "getter" in radio and radar tubes; as a catalyst in the production of synthetic rubber; as a constituent in superhard cutting tools; in corrosion-resistant chemical equipment; and in surgical instruments and supplies. There has been a limited production in New Mexico, South Dakota, North Carolina, and Virginia, but most of the supply is imported.

Tin.—Used in making tin plate, solder, bearing metals, bronzes and other alloys, tin coatings, foil, collapsible tubes, and numerous minor uses. There are no commercial deposits of tin ore in the United States, but there have been sporadic small outputs, mainly from Alaska. War conditions led to the establishment of a tin smelter at Texas City, Texas, using ores mainly from Bolivia, and small amounts of metal have been produced in other plants.

Titanium Ores.—Ilmenite is used mainly for the production of titanium dioxide for use in paints, and rutile for welding rod coatings; both are used in the production of ferroalloys and carbides. In addition to extensive imports, ilmenite is produced in New York, Florida, Virginia, and North Carolina, and rutile in Florida and Virginia.

Topaz.—Used industrially in refractories and as a thinner in open hearth slags. It is mined in South Carolina.

Tripoli.—Used principally as an abrasive or filler. It is mined in Missouri, Illinois, and Pennsylvania. The variety known as rottenstone occurs only in Pennsylvania.

Tube Mill Liners.—Used as a lining in tube mills for the grinding of ores and other products. Production is mainly in California, Minnesota, North Carolina, Texas, Washington, and Wisconsin.

Tungsten.—Used in the production of high-speed alloy-cutting steels and hard carbides, electric light filaments, contact points in electrical equipment, and other minor applications. Wolframite and scheelite are the more important ores. Concentrates from North Carolina, and from Nevada, California, Colorado, Idaho, and other western states are supplemented by imports.

Uranium.—Formerly used as a source of coloring agents for ceramic glazes, and to a minor degree in alloys, uranium has become best known as the source of material for atomic fission. In the United States, the metal is usually associated with ores of vanadium, in Colorado, Utah, and New Mexico.

Vanadium.—Used as an alloying agent in alloy steels and cast irons, as a deoxidizer and degasifier in steels, and as a catalyst. Domestic mine production in Colorado, New Mexico, Utah, and Arizona is supplemented by byproduct recoveries from phosphate rock mined in Idaho, and from imports from Peru.

Vermiculite.—Used as a heat and sound insulator, and as an admixture in concrete and plaster to produce porosity and light weight, as well as insulation. It is mined chiefly in Montana, South Carolina, Wyoming, Colorado, and North Carolina.

Wollastonite.—Used in thermal insulation, pottery glazes, and as filler in paints, rubber, and linoleum. It is mined only in New York.

Zinc.—Used in galvanizing and the making of brass and die-casting alloys. Ore production is widely distributed, with extensive outputs in 18 states from New Jersey down to Tennessee in the east, and extending to the west coast, with Idaho, New Jersey, Arizona, and Oklahoma in the lead. About 80 per

cent of the metal content is converted to metal, the remainder going mainly into oxide and lithopone. Of the metal recovery, about two thirds is smelted and one third electrolytic. The leading smelting states are Pennsylvania, Montana, Illinois, and Oklahoma.

Zirconium.—The larger part of the zirconium consumption is in refractories and ceramics, only about one third of the total going into metal or alloys. Domestic production is limited to Florida, and equal or greater amounts are imported.

G. A. ROUSH,
The Mineral Industry.

MINERAL TALLOW, also called hatchette, a yellowish-white, soft and inodorous mineral wax, or tallow, that melts at 115° to 170° Fahrenheit. It is composed of about 86 per cent carbon and 14 per cent hydrogen. The substance is closely related to ozocerite. It is found in Wales, Scotland, Moravia, Austria, Germany and Siberia.

MINERAL WATERS, a term used to designate such waters as have as constituents an unusual proportion of medicinal minerals. Mineral waters have been used as remedial agents from the earliest days of Greece and Rome. There were sulphurous thermal springs at Tiberius, which are still used by invalids from all parts of Syria, in cases of tumor, rheumatism, gout and other diseases. There are also warm springs at Calirrhoe, near the Red Sea, which are mentioned by Josephus as having been tried by Herod in his sickness. The Romans discovered the thermal springs in Italy, and the springs in other parts of Europe—Baden-Baden, Aix-la-Chapelle, the Spa in Belgium, and others. Pliny mentions mineral springs in various parts of Europe.

Classification.—No classification of mineral waters based upon their chemical composition can be strictly exact, because many springs are intermediate between well-characterized groups. The following classification is regarded as the most comprehensive:

The first general division is as to thermal or non-thermal. Waters which issue from the ground at a temperature above 70° Fahrenheit belong in the first class; those whose temperature is below 70° to the second class.

Four divisions are made as to the chemical constituents of the several waters: (1) the alkaline; (2) the alkaline-saline; (3) the saline, and (4) the acid. The *alkaline* waters are those which have an alkaline reaction and contain carbonic acid or bicarbonic acid ions in predominating quantities; or boric or silicic acid ions in predominating quantities, so that their alkalinity is evidently due to the presence of borates or silicates. The *saline* waters are those having an alkaline or neutral reaction and contain sulphuric, muriatic or nitric acid ions in predominant quantities. The *alkaline-saline* waters come between the two groups just described: they have an alkaline reaction and contain sulphuric, muriatic or nitric acid ions along with carbonic or bicarbonic acid ions; or they contain sulphuric, muriatic or nitric acid ions along with boric acid or silicic acid ions—both classes being present by predominating constituents.

Mineral waters are also grouped as to their gaseous constituents: (1) non-gaseous; (2) carbon-dioxidated—containing carbon dioxide gas; (3) sulphuretted—containing hydrogen sulphide gas; (4) azotized—containing nitro-

gen gas; (5) carbureted—containing methane gas, and (6) oxygenated—containing oxygen gas.

The scheme proposed by the United States Bureau of Chemistry for the exact classified descriptions of mineral waters is as follows:

Thermal or Nonthermal	Sodic Lithic Potassic Calcic Magnesic Ferruginous Aluminous	Carbonated or Bicarbonated
		Borated Silicated
		Sulphated Muriated Nitrated
		Sulphated Muriated Nitrated
		Sulphated Muriated

The description of a sample mineral water might read according to this schedule, "a non-thermal, calcic, bicarbonated, alkaline water"; or "a thermal, sodic, borated and carbonated, alkaline water"—and be exactly classified.

Geologists agree that the dissolved mineral substances in the water are obtained from the rocks through which the water has flowed. There is, therefore, undoubtedly more or less relation between mineral springs and the geological structure of a region. Waters which contain carbonic acid are greatly increased in solvent powers in the presence of lime, magnesia, iron, and even the rather insoluble silica. Many of the mineral waters, however, must be treated to remove excess minerals or salts before being used.

Physical Characteristics.—Although they sometimes have a greenish, opalescent hue due to their density, mineral waters are usually clear. Occasionally mineral waters are whitish, a condition due to suspended sulphur or suspended calcium carbonate; sometimes they are slightly bluish because of suspended slate or clay. A reddish tint may be due either to a suspension of particles of red oxide of iron or to the presence of minute algae.

Waters containing sulphureted hydrogen or particles of free sulphur have a most penetrating taste and smell. Mineral waters sometimes taste extremely bitter because of the presence of sodium or magnesium sulphate or magnesium chloride. Alkaline waters, which have a decidedly smooth feel, have a characteristic alkaline taste, while saline waters taste of ordinary table salt. Ferruginous waters have a definite styptic taste.

Of the thermal waters, those between 70° and 98° Fahrenheit are called tepid, while all exceeding the latter temperature are classified as hot springs. The following examples give the Fahrenheit degrees of temperatures found in different thermal springs: Warm Springs, Ga., 70° to 90°; Lebanon Warm Springs, N. Y., 75°; Hot Springs, Va., 110°; Las Vegas Springs, N. Mex., 110° to 140°; Hot Springs, Ark., 76° to 157°; San Bernardino, Calif., 108° to 172°; and Steamboat Geyser Springs, Calif., 212° with the water escaping as steam.

Therapeutic Action.—While often beneficial in cases of chronic disorders or in convalescence, the taking of mineral waters is certainly no panacea. In the past, widespread distrust has arisen of the use of mineral waters because of the extravagant claims which have so often been made by ruthless promoters of commercial waters

and resorts. As a result the waters were often indiscriminately used and frequently did more harm than good. Mineral waters should only be taken under the orders of a competent physician

Alkaline

Alkaline-saline

Saline

Acid

Arsenic
Bromic

Siliceous
Boric
Lithic
Ferruginous
etc.

Non-gaseous
Carbondioxated
Sulphureted
Azotized
Carbureted
Oxygenated

for a particular purpose and during a specific length of time.

The therapeutic action of mineral waters depends, in the first place, upon their chemical composition and to some degree upon their pressure and temperature. But other circumstances, also, such as the general physical environment, elevation, climate, and mean temperature of the region of the springs have an important bearing upon the success of the treatment. In addition the habits and the temperament of the individual patient and the pathology of his particular ailment must be taken into consideration. Certainly, too, one of the more important—if not the most important—aspects of such treatment is the change in environment and pace of living that goes with a period of stay at a mineral-spring resort. The effects upon each individual are both constitutional and psychological, and a course of water beneficial to one person might be highly injurious to another.

The dosage of mineral waters, naturally varies from spring to spring and from patient to patient, but relatively large quantities are usually most effective, hot waters are generally more beneficial than cold, and for the greatest effect waters are usually taken on an empty stomach. Light exercise is often prescribed, and a regulated diet is advised. Since the "water cure" should be continued for a sufficient length of time to give the particular waters a fair trial, it is usually felt that from six to twelve weeks are necessary.

In some cases bathing is of even greater importance as a remedial agent than is drinking. Here again the type of bath and the length of time in the bath vary from spring to spring and from patient to patient, and the directions of the physician should be strictly adhered to. Bathing stimulates the circulation of the blood and has an important tonic effect. Some gases dissolve in the waters and some of the trace elements such as boron, bromine, and iodine, are absorbed directly through the skin.

Certain mineral springs contain radioactive mineral waters generally arising from the presence of radon or radium emanations. Though probably beneficial in some pathological conditions such as certain types of arthritic affliction the dangers in improper usage are very great. The dosage used should always be prescribed by a physician.

Alkaline Waters.—Simple alkaline acidulous waters are composed of carbonic acid and the carbonates, bicarbonates, borates, or silicates of alkali metals or alkaline earths. Important springs of this class are the thermal springs of Las Vegas, N. Mex., and the cold springs of

Sharon, N. Y. These waters are useful in certain forms of indigestion, jaundice, gallstones, gout, and chronic catarrh of the respiratory organs. Muriated alkaline acidulous waters, which differ from the preceding, contain a considerable quantity of sodium chloride. They are useful in chronic catarrhal conditions of the bronchial tubes, the stomach, and the intestines. Alkaline saline waters containing sulphate and bicarbonate of soda, such as the warm springs of Karlsbad (Karlovy Vary), Bohemia, Czechoslovakia, are of value to patients suffering from habitual constipation.

Bitter Waters.—The chief contents of these waters are sodium chloride and magnesium and sodium sulphate. Well-known springs of this class are those at Kissingen, Bavaria; Cherry Rock, Gloucestershire; and Mount Clemens, Mich. These waters act as purgatives and diuretics.

Muriated Waters.—Simple muriated waters contain a moderate quantity of sodium chloride or common salt. Important springs in this class are those in Germany at Wiesbaden and Baden-Baden, which are hot, and at Homburg, which are cold. Of the muriated saline springs at Saratoga, N. Y., some are chalybeate, others, sulphurous or iodinous; all of them are rich in carbonic acid gas. These waters are chiefly employed in cases of gout, rheumatism, and scrofula. Muriated lithia waters contain lithium and sodium chloride.

Earthy Waters.—These waters contain sulphate and carbonate of lime. The waters of Nildungen, Germany, are diuretic and also used for chronic catarrh of the bladder. The baths of Leuk, Switzerland, are chiefly used in chronic skin diseases.

Mild Thermal Waters.—Waters of this type contain only a small amount of saline constituents. Of the springs of this class, Hot Springs, Ark., and Hot Springs, Va., are very important. Their most striking effects are to stimulate the skin and excite the nervous system. They are especially used in chronic rheumatism, chronic gout, and diseases of the skin.

Chalybeate Waters.—Simple acidulous chalybeates contain carbonic acid and ferrous bicarbonate; carbonate, sulphate, and chloride of sodium are frequently present and may help in the cure. Although the quantity of iron present is generally very small, these waters are very valuable in cases of anemia. Two examples of chalybeate springs are the Chalybeate Mineral Springs, Mo., and the Chalybeate Springs, Ga. The largest number of mineral springs in the New England region are of the chalybeate class.

Sulphurous Waters.—These waters contain hydrogen sulphide or metallic sulphides (sulphurets), or both. Important sulphurous therms are those of Aix-la-Chapelle, Germany; Baden, Austria; and Barèges, France. There are hundreds of these sulphurous springs in the United States, including Richardson Mineral Springs, Calif., and White Sulphur Springs, W. Va. These waters are used in skin diseases, gout, and rheumatism.

American Mineral Waters.—In the United States, Rock Spring at Saratoga, N. Y., like many other springs, was known among the Indians. Here friendly Mohawk Indians brought Sir William Johnson in 1767 to bathe in the waters. Virginia Hot Springs was visited as early as 1720 by white men, and a tavern was

built there in 1766. White Sulphur Springs, W. Va., was first used by white men in 1778.

Particularly in the late 19th century the spots for taking mineral water became greatly in fashion with elaborate facilities set up to amuse the patrons, the waters usually being but an accessory to the social life carried on there. In general, however, American mineral springs have been much less extensively developed than those of Europe; furthermore, scientific research into the properties of these waters has been neglected in this country, though such research has had a definite place in European medicine. The State of New York, which purchased the spring area of Saratoga Springs making it a state reservation, however, did set up a research institute in balneology there in 1935.

The majority of the commercial springs of the United States are located in the older parts of the country east of the Mississippi. It has been estimated that there are about 8,800 mineral springs in the United States in about 2,700 separate areas of which over 400 are used commercially. Wyoming, California, Virginia, Texas, Missouri, Colorado, and New York have the greatest number of springs. New York leads in the commercial exploitation of mineral waters. In the South, Kentucky, Tennessee, and Arkansas are the chief producers of mineral waters. In 1921, Arkansas Hot Springs, believed by some to have been the "Fountain of Youth" which Ponce de Leon was seeking, was made a national park.

In the United States the production of imitation mineral waters, made by the addition of salts or carbon dioxide gas to plain water, is, like the bottling of natural waters for drinking and medicinal purposes, a thriving industry.

MINERAL WELLS, city, Texas, is located in Palo Pinto County, north central Texas, about 45 miles west of Fort Worth, at an altitude of 925 feet. Served by the Weatherford, Mineral Wells and Northwestern Railroad, Pioneer Air Lines, and federal highways, it is essentially a health and pleasure resort. The popular mineral springs in the vicinity attract thousands of visitors annually, and each year more than 1,000,000 gallons of water are shipped. In the midst of a grain and livestock area, the chief industries of Mineral Wells are dairying and the manufacture of brick, ceramics, and silk products. Hexagon House, erected in 1897, is an architectural curiosity. The city was founded in 1880 and incorporated in 1891. Pop. (1950) 7,801.

MINERAL WOOL, also known as slag wool, rock wool, silicate cotton, or cotton fiber, is a product of molten slag or rock which has been subjected to a steam or air blast. The result of this process is a light, fluffy, vitreous fiber, useful as a non-conductor. It was first manufactured on a sizable scale in Germany in the early 1870's. In 1875 some mineral wool was made at the Greenwood iron furnace in Orange County, N. Y.; the industry

was firmly established by 1885, but its product, made from slag and called slag wool, was soon in competition with rock wool, a similar fiber made from rocks and lacking the small percentage of sulphur that sometimes formed injurious sulphuric acid in the slag product when it came in contact with water. In 1951 over 10,000 people were engaged in the production of mineral wool from slag, rock, and glass. The total value of the product in that year was estimated at \$134,128,000, of which about 1½ million dollars' worth was exported. It remains one of the best practical non-inflammable coatings and is a non-conductor of heat. As a lining for floors it has the additional advantage of being soundproof. Rock, glass, or desulphurized slag wool are often used to encase steam pipes.

MINERALOGY, mĭn-ĕr-ăĭl'ô-jĭ, is the science which deals with minerals. It is especially concerned with their chemical composition and their physical characteristics, including the crystal form and structure. Mineralogy considers the origin and occurrence of minerals in the earth's crust, their geographical distribution and their utilization.

The science is closely related to several others, such as geology, chemistry, physics, and mathematics. The rocks studied by the geologist are made up of minerals. Their identification and classification depend upon their mineral composition. The study of the crystal forms and atomic patterns of minerals is a branch of solid geometry. Chemical methods must be used to establish the composition of minerals, and many chemical tests are used in their identification. The processes of mineral formation and alteration are chemical reactions. Important discoveries in physics, especially in optics, have been made through the study and use of mineral crystals. The recovery of minerals from the earth involves mining engineering, while the extraction of useful metals and compounds involves metallurgical and chemical engineering.

A mineral is a homogeneous substance with a composition which may be expressed by a chemical formula, and which occurs in nature and is not the direct product of life. Most minerals are crystalline. Many minerals may be duplicated by man, but are then termed synthetic or artificial, as synthetic ruby and sapphire, and artificial ice. The term mineral is not restricted to terrestrial objects, but is also applied to the components of meteorites, which in general are similar to minerals found on earth.

Among the members of the mineral kingdom which do not fully qualify as minerals are asphalt and petroleum, because they are complex mixtures, and volcanic glass, formed when lava cools too quickly to allow individual mineral constituents to crystallize. A pearl is the direct product of an organism and does not change after formation, hence is not called a mineral. Shells, which definitely belong in the animal kingdom, may lose their organic material, and be broken, compacted, and cemented to form limestone, which is composed of calcite, a mineral. Likewise, vegetation may form peat, and then soft coal, hard coal, and sometimes graphite. The last is definitely a mineral. The coals and certain other natural hydrocarbons clearly belong to the mineral kingdom, but because of variable compositions do not fully qualify as minerals.

Mineralogy as a science is comparatively

modern. While the ancients utilized a very considerable number of minerals, some for the metals they contained, others as pigments, ornaments, charms and talismans, and still others in medicine and the arts, they knew little as to their composition. They classified them, but in an unscientific way. There is still extant part of a work *On Stones*, written by Theophrastus before 287 B.C., while Pliny in his great work on natural history, in the year 77 A.D., devoted five books to "earths, metals, stones, and gems."

As chemical knowledge increased, the compositions of minerals were gradually determined and became the basis of classification. The recognition of the importance of the crystal form in mineral determination followed the invention of the reflecting goniometer by William Hyde Wollaston in 1812. This made possible a study of the relation of crystal form to chemical composition in groups of isomorphous minerals. With the development of modern optics and the recognition of the unique optical properties of crystals, there developed techniques for mineral identification by the determination of their optical properties. X-ray methods make possible the determination of the atomic positions in minerals.

Thus the modern classification and description of a mineral includes not only the chemical composition and ordinary physical properties, but also the crystallographic and optical constants, and the data concerning the size of the unit cell and the location of the individual atoms.

Mineralogy may be conveniently considered under the following headings:

Crystallography	Crystal Structure
Physical Mineralogy	Formation and Occurrence
Chemical Mineralogy	Uses
Optical Mineralogy	Descriptive Mineralogy
	Determinative Mineralogy

Crystallography.—This is a limited phase of solid geometry, being restricted to those geometrical forms which result from crystal growth. Since the crystal form is of great value in identifying minerals, the subject has been developed largely by mineralogists, and has its own nomenclature, its own type of projections and drawing, and its own methods of calculation. See CRYSTALLOGRAPHY; and CHEMICAL CRYSTALLOGRAPHY.

Physical Mineralogy.—Physical mineralogy considers the physical properties of minerals. Some of these are directly related to the crystal structure, and are discussed separately in the articles on CRYSTALLOGRAPHY, and CLEAVAGE. Other physical properties, which are either not dependent on or not so closely related to crystal structure, are here discussed.

Luster, as used in the mineralogical sense, is difficult to define precisely. It includes the degree of brilliancy, as indicated by the use of such terms as dull, shining and splendid, but is more concerned with the kind of brilliancy. For mineral descriptions, luster is divided into metallic and nonmetallic. The former is further described as iron black, steel gray, tin white, golden yellow etc. The nonmetallic lusters include vitreous, adamantine, pearly, resinous, silky, waxy, greasy, pitchy, etc.

Color depends upon the ability of a mineral to absorb in different proportions the various wave lengths which make up the incident light. A white or colorless substance transmits or reflects all colors equally.

Some minerals have a constant color, such as gold, malachite and sulphur, and are said to be

idiochromatic. The color in this case is inherent in the substance itself, and is always evident unless the mineral is so admixed with impurities that the color is diluted or masked. Other minerals may be colorless or white when pure, but show colors when impurities are present. These are said to be allochromatic. The color may be due to dissolved impurities, as in the case of ruby and sapphire, or to colored inclusions. For example, quartz may be red or yellow, due to disseminated particles of iron oxide, or green, due to scales of chlorite.

Other color or optical effects are known as play of colors, opalescence, tarnish, dichroism, asterism, etc.

Streak is the color of the fine powder of the mineral. It is usually obtained by rubbing the mineral on a piece of unglazed porcelain. If the mineral is softer than the porcelain, it leaves a streak whose color is readily apparent. In some cases the streak is markedly different from the color of the original specimen. Thus hematite and goethite, both occurring in black fibrous masses, give red-brown and yellow-brown streaks, respectively, and may be easily distinguished. Minerals too hard to rub off on the streak plate are said to have colorless streaks.

Hardness is defined by the mineralogist as resistance to scratching or abrasion. A harder mineral will scratch a softer one. An arbitrary scale of minerals was devised by the mineralogist Friedrich Mohs, and is used to designate degrees of hardness. It consists of ten minerals, beginning with (1) talc (softest); (2) gypsum; (3) calcite; (4) fluorite; (5) apatite; (6) feldspar; (7) quartz; (8) topaz; (9) corundum; (10) diamond (hardest). Each mineral in the scale will scratch all of the preceding ones, hence there is a progressive increase in hardness. However, this increase is not uniform. There is an especially large gap between (9) and (10). Moreover, no mathematical ratio is implied. A mineral with a hardness of four is not twice as hard as one with a hardness of two. The hardness is not expressed in specific units, but merely by comparison with the hardness of certain minerals selected as standards.

If two minerals both scratch each other, or if neither scratches the other, they have the same hardness. A mineral may be intermediate between two adjacent minerals in the scale. For example, if a mineral will scratch calcite (3), but is scratched by fluorite (4), it is said to have a hardness of $3\frac{1}{2}$. No fractional values other than $\frac{1}{2}$ are used. The approximate hardness can be determined by reference to other standards if the minerals of the scale are not available. For example, the fingernail is $2\frac{1}{2}$; a copper coin is 3; window glass, $5\frac{1}{2}$; hard steel file, 6 $\frac{1}{2}$. The hardness of a crystal varies with different directions. Although the diamond is said to have a hardness of 10, some directions are harder than others. It is only because of this variation that it is possible to use diamond powder to grind and polish diamonds. Harder directions in the powder will act on softer directions of the stone being shaped. Usually these variations in hardness for a given mineral are small in comparison with the divisions of the scale. Thus both the hardest and softest directions of calcite are considered as hardness 3. The mineral kyanite is an exception. It occurs in long bladed crystals, and across the blades the hardness is 7; parallel to them it is 4.

Specific gravity is defined as the weight

of a substance compared with the weight of an equal volume of distilled water at 4°C. It is numerically equal to density, if the latter is expressed in grams per cubic centimeter. The specific gravity of a pure crystallized substance is practically constant, but as indicated in the later section on Chemical Mineralogy, most minerals contain at least traces of other substances and hence may have variable specific gravities.

Various methods are used to measure specific gravity. Many are based on the fact that when an object is immersed in water it weighs less than when weighed in air. The loss in weight is equal to the weight of the water it displaces. Obviously it displaces its own volume of water, hence by definition specific gravity =

$$\frac{\text{wt. in air}}{\text{wt. of equal volume of water}} = \frac{\text{wt. in air}}{\text{loss of wt. in water}}$$

There are various other properties which may be of value in mineral identification. The fracture surface is described by such terms as even, uneven, conchoidal, splintery and hackly. Substances may be described as elastic or as flexible. Tenacity is expressed as brittle, sectile, malleable, ductile or tough. The feel is described as smooth, rough, slippery or soapy. A few minerals have a characteristic taste or odor. Although many minerals will respond to a powerful electromagnetic field, only a few will be attracted by a simple horseshoe magnet.

When minerals do not occur in crystals they are said to be massive. Even without the crystal form there are many characteristic appearances which may be helpful in identification. Minerals may occur in fine or coarse granular aggregates. They may be in needles or fibers, which may be interlaced, parallel, or in radiating or divergent groups. They may be in small rounded particles or in larger rounded masses, termed in order of increasing size, oolitic, pisolitic, botryoidal, mammillary and reniform. Numerous other descriptive terms are used for various structural features, including columnar, tabular, foliated, platy, spongy, cellular, arborescent and dendritic.

Variations in physical properties without any basic change in composition or structure give rise to what are known as varieties of a mineral. The mineral quartz has several varieties based on color, as rose quartz, citrine, amethyst, and carnelian. Ruby and sapphire are colored varieties of the mineral corundum. Gypsum, when occurring in white, fine-grained form, is called alabaster, while a fibrous form is satin spar. Calcite occurring in sharp scalenohedral crystals is known as dog-tooth spar. Brilliant black hematite is specular iron ore, while the red earthy type is called red ochre.

Chemical Mineralogy.—A few minerals occur as elements, such as sulphur, copper, silver and gold, but the great majority are chemical compounds. The chemical composition of a mineral is its most important feature as far as classification is concerned, and is of prime importance in identification. Standard chemical procedures are used in mineral analysis. The results of such an analysis for the mineral beryl show how the formula is calculated.

	Percentage composition	Molecular weights		Ratio
BeO	14.01	25.02	=	0.560 3
Al ₂ O ₃	19.26	101.94	=	0.189 1
SiO ₂	66.37	60.06	=	1.105 6

The formula may thus be written $3\text{BeO} \cdot \text{Al}_2\text{O}_3 \cdot 6\text{SiO}_2$, or $\text{Be}_3\text{Al}_2\text{Si}_6\text{O}_{21}$.

In addition to the regular chemical methods for making a complete analysis, many qualitative tests for particular elements are useful in mineral identification. The so-called "blowpipe methods" include colored sublimate on charcoal and plaster tablets, colored heads made by dissolving minute amounts of the mineral in molten drops of borax and other salts, and colored flames produced by the volatilization of certain compounds or elements.

The chemical classification of minerals is described in section (8) *Descriptive Mineralogy*. Within the major divisions, whenever possible, minerals are placed in isomorphous groups, which are based on analogous chemical composition and similar crystal forms. An example of isomorphism is the well known calcite group, which consists of the minerals calcite, magnesite, siderite, rhodochrosite and smithsonite. They all crystallize in the same symmetry class, all have high double refraction, and all have rhombohedral cleavage. In a series of this kind, if the atomic dimensions are close, it is possible for one element to proxy for another in the structure. This is known as isomorphous replacement. Thus in siderite, FeCO_3 , any proportion of the iron (Fe) atoms may be replaced by manganese (Mn) atoms, giving a continuous solid solution series from pure FeCO_3 to MnCO_3 . For intermediate members the formulas may be written as $(\text{Fe}, \text{Mn})\text{CO}_3$ or $(\text{Mn}, \text{Fe})\text{CO}_3$, depending upon which element predominates.

Optical Mineralogy.—Crystallized substances have unique optical properties. With the exception of those in the cubic system, all are double refracting, that is, in passing through them ordinary light is broken up into two plane polarized rays which travel with different velocities and are refracted at different angles. Cubic substances have only one index of refraction, but hexagonal and tetragonal substances have two indices, and those in the remaining systems, orthorhombic, monoclinic and triclinic, have three indices of refraction. The determination of these indices alone may be sufficient for identification. Such determination can be made even on microscopic grains, by use of the petrographic microscope, which differs from the ordinary microscope by its use of plane polarized light. Because of the different velocities with which the rays travel, various interference colors and figures may also be obtained, and make possible a complete method of identification.

Opaque ore minerals may be studied by the use of reflected light with the microscope. Variations in color, reflectivity and response to various etching agents provide a means of identification of opaque minerals. This field is known as mineralogy.

Crystal Structure.—The determination of the actual atomic arrangement in a mineral by X-ray methods may be of importance in several ways. (a) In minerals with complex compositions the exact formula may be impossible to deduce without a knowledge of the structure. (b) The structure offers a more precise way of establishing isomorphism. Thus a long used classification of the barite group included CaSO_4 , SrSO_4 , BaSO_4 and PbSO_4 . However, the arrangement of the Ca and the SO_4 group in CaSO_4 is quite different from that in the others, and it is not isomorphous with them. (c) A knowledge of the structure

may make possible a correlation between the atomic positions and certain physical properties. (d) An X-ray powder diffraction photograph, even when not utilized in deducing the atomic arrangement, is a precise and indisputable method of mineral identification. It can be used on an extremely small amount of material, and has the advantage of not consuming the sample, as does a chemical analysis.

Formation and Occurrence.—The processes by which minerals are formed follow the same laws which govern reactions in the laboratory. However, there are important differences in degree with respect to pressure, temperature, and time. Man so far has not produced simultaneously the temperatures and pressures which are required for certain types of mineral formation, nor does he have available the almost unlimited time which nature has used to produce some minerals.

The origin of some minerals is very obvious, as in the simple deposition of rock salt and gypsum from evaporating sea water, as has occurred in past geological periods. In other cases the origin is complex and not entirely understood. The possible methods of formation may be summarized as follows:

Formation from Gases: Sublimation.—The most common example of this process is the formation of snowflakes from water vapor. Direct deposition from hot gases may occur in connection with volcanic activity. A related process, known as pneumatolysis, refers to the interaction of two gases, or that of a gas with the country rock adjacent to igneous intrusions.

Formation from Liquids.—These liquids may be either molten rock, magmatic water, or ground water. Molten rock reaching the earth's surface is called lava, while beneath the surface it is known as magma. A magma is formed by the melting of previously existing rocks at moderate depths. The resulting liquid tends to migrate toward the earth's surface. If it reaches the surface as a lava flow or volcanic eruption, the resulting "extrusive" rocks are fine grained or glassy, because of the rapid cooling. If the magma does not reach the surface, cooling may be very slow, resulting in coarser grained "intrusive" rocks. Certain characteristic minerals, including feldspars, quartz, pyroxenes, amphiboles and micas make up the great bulk of these igneous rocks, while a number of so-called accessory minerals may be present in minor amounts. The composition of the magma corresponds to that of the rocks which produced it. It contains, even at a high temperature, certain volatile constituents such as water, chlorine, fluorine, sulphur and boron compounds called mineralizers. These are retained in the magma because of the high pressure, and materially affect the fluidity and the chemical activity of the magma. They do not enter appreciably into the major crystallization products of the magma, and eventually form a residue, which is a hot concentrated aqueous solution called magmatic water, in contrast to the cool and dilute water solutions at or near the earth's surface known as ground water. The magmatic water produces important mineral deposits known as pegmatite dikes and plays an important part in the production of many ore deposits. The dissolved gases in the magma and in the magmatic water are involved in the pneumatolytic reactions mentioned under sublimation.

Ground water is the surface water in oceans, lakes and streams, as well as that in the porous

strata near the surface of the earth. Many characteristic reactions are brought about by the action of ground water. Minerals are dissolved, transported, altered and redeposited, and new minerals may be formed. Some common methods of this type of formation are (1) evaporation of ocean water to form salt; (2) decrease in temperature and pressure of water from geysers and hot springs, allowing their mineral content to be deposited; (3) bacterial action, and the action of organisms which extract mineral matter from the water and then secrete it to form shells and skeletons which may ultimately give rise to deposits of limestone, chalk, or tripolite; (4) the action of ground water containing CO_2 in dissolving limestone to form channels and caverns, and the reverse of this process, in which the dissolved material may again be deposited to form stalactites, stalagmites and other cave and stream deposits. Many other chemical reactions occur in ground water, including oxidation, reduction, hydration and carbonation.

Formation by Metamorphism.—This includes the production of new minerals or new varieties of old ones, chiefly through the action of heat and pressure, but the presence of water and other mineralizers may be important. In the movements of the earth's crust resulting in warping and folding of rock strata, various changes occur in which pressure is the predominating factor. These include the change from soft to hard coal, and the recrystallization of limestone to form marble. This process is known as regional or dynamic metamorphism, and may occur over large areas. When a large body of molten rock, magma, is working its way upward through the earth's crust, marked changes may occur in the country rock adjacent to the intrusion. This is known as local or contact metamorphism. Heat and pressure are both important, as well as the chemical action of mineralizers in the magma.

Occurrence of Minerals.—Minerals may occur in large rock formations, such as beds of salt, gypsum and limestone. One mineral may be disseminated in another. Minerals may be deposited in cracks and fissures to form veins and in a similar way cavities may be filled to form geodes. The occurrences of calcite in various types of cave deposits is well known. When mineral fragments are transported by water, sorting may occur, giving rise to placer deposits of the heavier, more durable constituents and stream and beach deposits of sand, which may be composed almost entirely of quartz, or may contain concentrations of other minerals as well.

Uses.—The ore minerals which furnish our metals are of enormous importance, but many non-metallic minerals are likewise essential to our civilization.

A great number of the raw materials of chemistry and industry are directly of mineral origin. And of course, all vegetable and animal products are derived indirectly from soil and water, both of the mineral kingdom. Some minerals are used in their original state, as building materials like limestone, marble, granite, sand and gravel. Others go directly into ceramic products, such as pottery, porcelain and glass. Others are processed into cements, plasters, plastics, artificial abrasives, fertilizers, pigments, etc. Chemistry finds important uses for sulphur, for sodium and chlorine derived from salt, for phos-

phates, borax, and many others. Numerous organic compounds are derived from coal and petroleum. Sources are not limited to mineral deposits. Salt has always been obtained in warm climates by evaporation of sea water, and the modern production of bromine and the light metal magnesium is from this same source. One important element, nitrogen, is obtained only in small amounts from mineral sources—the greater proportion is obtained from the atmosphere. See also MINERAL PRODUCTION OF THE UNITED STATES.

Descriptive Mineralogy.—This branch of mineralogy sums up the results of the study of minerals, as already outlined, into orderly form for each mineral species, and classifies the different species so that related minerals will be grouped together. The classification for inorganic compounds is as follows:

1. Elements
2. Sulphides and sulpho minerals
3. Oxides and hydrated oxides
4. Haloids
5. Nitrates, carbonates and borates
6. Sulphates, chromates, molybdates and tungstates
7. Phosphates, arsenates, and vanadates
8. Silicates

Within these major divisions, the chemical composition and crystal form are used to group those minerals which are isomorphous, or which are most similar.

Determinative Mineralogy.—Determinative mineralogy deals with the identification of minerals. When a new mineral is found, a chemical analysis must be made to establish its formula, the crystallographic and optical data must be determined, and the various physical properties noted. These data constitute the description of the mineral. Previously described minerals, however, are usually identified by much simpler methods. Sight recognition may be possible if there is some obvious feature, such as a unique color, definite crystal form, recognizable cleavage or characteristic structure. With experience in handling and testing minerals, it becomes possible to identify many minerals in this way. The more general methods of determinative mineralogy make use of tables in which the minerals are arranged in some systematic order. Two or more major divisions are used, based on some easily determined property. These are divided into smaller groups by using a second property, and these in turn are subdivided, and so on. By noting these same properties on an unknown mineral, it is placed first in the proper major division, and then successively in the smaller and smaller groups. Finally the possibilities are restricted to such a small number of minerals that the individual differences between the members are readily recognized, and the final decision can be made. Obviously, the mineral in question must be among those listed in the table.

Tables of this kind may be based solely on (1) physical properties; or (2) a combination of chemical tests and physical properties. In addition to these, there are special tables based on (3) optical properties; (4) mineralogical tests; and (5) X-ray data.

Physical Property Tables.—Most of the tables used are modifications of the original tables prepared by Albin Weisbach in 1866. One set in common use has two major divisions based on (1) metallic luster; and (2) nonmetallic luster. Each of these is divided into five color groups, and each color group subdivided according to streak.

In each of these smallest groups the minerals are arranged in order of increasing hardness. Another set of tables likewise makes the initial division into metallic and nonmetallic lusters, with the latter subdivided into (a) streak colored; and (b) streak colorless. Further subdivision is according to hardness, combined with the presence or absence of a prominent cleavage. Some tables begin with divisions based on streak, followed by subdivision into color groups.

Chemical and Physical Tables.—The chemical tests are chiefly those called "blowpipe tests" as described in the section on *Chemical Mineralogy*. Most tables of this kind are modifications of Franz von Kobell's tables, first published in 1833. The initial division is into minerals with metallic and nonmetallic lusters. The former are divided into (a) fusible, with specific tests for As, Sb and S; and (b) infusible, with tests for Fe and Mn. The nonmetallics are divided into (a) volatile or combustible; (b) fusible, with subdivisions: (1) Metal globules when fused on charcoal with soda; (2) Magnetic after heating in reducing flame; (3), Those not included in (1) and (2), separated according to behavior in HCl, alkaline reaction after intense ignition, solubility in water, etc. (c) Infusible, with subdivisions similar to (b-3). Final identification in many cases is made by specific tests for elements or radicals. As an example, a specimen of olivine would be placed successively in the following divisions and subdivisions:

Nonmetallic luster.
Infusible.
Dissolves in HCl, leaving gelatinous residue of silica on evaporation.
Gives test for Mg.
Contains no water.
Gives test for Fe. Therefore olivine.

This identification is confirmed by the green glassy granular appearance of the specimen, which is typical of olivine.

Optical Properties.—The determination of the optical properties is very important in the identification of very small crystals and fine-grained material. Substances are classified either as (1) isotropic (with one index of refraction); or (2) anisotropic, including (a) uniaxial (two refractive indices); and (b) biaxial (three refractive indices). The uniaxial and biaxial groups are further divided according to their positive or negative character. Tables are available with divisions, corresponding to these groups, in which the minerals are arranged in order of increasing refractive indices. Additional optical observations can be made, such as color, pleochroism, optic angle, extinction angle, dispersion, and the orientation of the optical directions with respect to crystallographic directions.

Mineralogical Tests.—For opaque minerals, the microscopic examination of polished surfaces with reflected light is very useful in identification. Minerals may have a distinctive color or varying shades of gray which can be compared with standards. Various reagents applied as tiny drops may produce effervescence, staining, a precipitate, or reveal a structure or texture. There are determinative tables for opaque minerals based on such tests.

X-Ray Identification.—X-rays can be reflected from the internal atomic planes of crystallized substances, and various X-ray methods have been developed for determining the arrangement of the atoms. The so-called "powder method" not only furnishes data from which the crystal structure

may be deduced, but also provides an extremely useful method of identification. An X-ray powder photograph consists of a pattern of lines whose positions and intensities are dependent upon the atomic arrangement. To the extent that no two different substances may have identical atomic arrangements, no two substances may have identical X-ray powder patterns. Positive identification of a mineral may be made by measuring the positions and intensities of the lines of its powder photograph, and checking the results against published data for known materials.

MINER'S INCH. See HYDROLOGY; WEIGHTS AND MEASURES—Unit Standards.

MINERSVILLE, borough, Pennsylvania, in Schuylkill County; altitude 697 feet; on the west branch of the Schuylkill River; 4 miles west of Pottsville; on the Pennsylvania and Reading railroads. Thomas Reed, the first settler, built a tavern, sawmill and distillery here in 1793. Situated in the hard coal region, its chief industries are connected with mining and shipping coal. There are also machine shops and garment factories. Pop. (1950) 7,783.

MINERVA, mī-nēr'vā, village, Ohio, on the line between Stark and Carroll counties, 15 miles east-southeast of Canton. It is served by the New York Central, Pennsylvania, and New York, Chicago and St. Louis railroads. Manufactures include dinner ware, electric switches and signaling devices. The village was founded in 1835. Pop. (1950) 3,280.

MINERVA, one of the chief Roman divinities, identified with and having similar attributes to the Greek Athena. Her name, probably derived from the same root as *mens* (mind), suggests her characteristic as the personification of the power of the intellect. With her father Jupiter and Juno she was worshiped as the triad of the Capitoline divinities. A virgin goddess, her sacrifices were calves which had not yet borne the yoke. She was reputed the inventor of numbers and musical instruments, especially wind instruments, and was patroness of all the arts and trades. At her five-day festival (March 9-23), called *Quinquatrus* because it began five days after the ides of March, she was invoked by all who would excel in any art or craft, as painting, poetry, teaching, spinning, and weaving. She was also patroness of warriors, teaching them cunning, prudence, courage, and perseverance. Hence she is portrayed panoplied with helmet, shield and armor.

MINERVINO MURGE, mē-nār-vē'nò nōōr'jā, commune, Italy, in Bari Province, Apulia, 40 miles west of Bari. Fruits, vegetables, and olive oil are produced here. Pop. (1936) 8,604.

MINES AND MINING, Military. In all periods of the history of warfare, particularly in siege operations and the somewhat similar operations in trench warfare, recourse has been had to the use and construction of subterranean passages, either as a means of penetrating the lines of the enemy, or to avoid a dangerous advance under fire at the surface, or for the destruction of a hostile position by the use of explosives, or to prevent on the part of the enemy undertakings such as those already described. These operations constitute military mining, and the charge of explosives set off under a position of the enemy is known as a mine. While any of the devices and methods employed in commercial mining may be used in appropriate military situations, military mining is dominated by the consideration of simplicity—for complicated tools cannot be brought up to the battle line—speed, and inconspicuousness. In addition, by far the greater part of the work is done in soil which is sufficiently soft to present relatively little difficulty to excavation, but which manifests a constant tendency to cave in. This tendency is accentuated by the continual disturbance of the soil by artillery fire and the countermines of the enemy. Accord-

ingly the reinforcement of the walls of his excavation is generally among the chief problems of the military miner. The methods used are much the same, whether the excavation is a vertical shaft or an approximately horizontal gallery. They fall into two general classes. In one, casings are inserted as the work progresses. These consist of four lengths of stout planking surrounding the excavation. Two opposite lengths are provided with mortises, and the other two with tenons. In the other type of mining, longitudinal planks known as sheathing are held in place by frames of strong timber.

Galleries are divided into great or grand galleries (6 feet high by 3½ feet); half galleries (4½ feet by 3 feet); branches (3½ feet by 2½ feet); and small branches (2½ feet by 2 feet). The smaller galleries are often excavated by earth augers; the larger ones by ordinary excavating tools reduced in size so as to be adapted to use in a confined space. An especial boring tool known as a "wombat" was devised by the Australians during World War I (1914-1918), and used with great success. It was worked by hand. The direction of galleries is determined by the ordinary surveying instruments used on the surface, due allowance being made for the unreliability of the compass under ground. The targets are of course slits through which an artificial light shines. The azimuth is transferred from the top to the bottom of a shaft by means of a pair of plumb lines, which are oriented by compass and map above ground. Ventilation is essential, and is secured by various mechanical means, or in a system of galleries with two or more outlets, by a fire near the upper end of a shaft. In difficult places, air may be pumped in by a hose. Respirators may be worn in case of emergency. Drainage is secured by sloping the floors of the galleries and supplying them with gutters. If it is not possible to make all the galleries slope toward the entrance, a sump is dug from which the water is pumped or carried in buckets. The lighting of galleries is often a difficult problem, on account of the nearness of explosives and the difficulties of ventilation. Electric lights are often used. Where it is possible, daylight is reflected into the gallery by mirrors or white surfaces, and the walls are whitewashed. The disposal of the excavated earth is often a difficult problem. It is usually taken away in sacks or relays of wheelbarrows. Sometimes, small narrow-gauge railways have been used.

The mine chamber is nearly cubical, or of the shape of a cylinder with an altitude twice its radius. It is often simply the end of a gallery or shaft. The charge is usually some high explosive such as dynamite or trinitrotoluol. It is set off by a detonator and primer, usually fired by electricity, though a powder fuse may be used. The charge is tamped by obliterating from 6 to 10 feet of the passage leading up to the chamber.

The explosion of a mine produces a compression of the surrounding soil which will blow in any gallery within a certain radius. It also causes a pit or crater to be excavated in the surrounding soil, provided the chamber is sufficiently near the surface. A mine which does not break the surface is known as a camouflet. In a normal mine, the depth of the charge beneath the surface is equal to the radius of the crater at the surface of the ground.

Mines dug from the surface are known as land mines, or if the crater is filled with stones, etc., so as to form a crude mortar, as fougasses. Land mines are only permissible in ground obviously prepared for defense. They may be set off by devices under the control of some operator, or automatically by triggers or other such means.

The tactics of mining depend on the opposition of mines by countermines. It is always necessary to supplement one's own effort to attain his objective by an effort to frustrate the plans of the enemy. The only way by which reliable information of the progress of the enemy can be attained is by listening either directly, or with the aid of geophones. Men are trained for this purpose, and stationed in galleries called listeners, placed sufficiently near to one another to prevent a hostile gallery from being pushed between them without being heard.

It is generally better in mining operations to come into actual contact with the countermines than to fire too soon. The best place to attack a hostile gallery is from the side, as then a greater length of gallery is destroyed.

Mines are sometimes used to form craters to take the place of trenches in an advance. A row of such craters serves not only as a parallel on the surface, but as a starting point for new mines.

Galleries are usually started as near the hostile lines as possible, i.e., from advanced saps. In fortresses, concrete-lined permanent galleries often serve as a beginning for countermine galleries in case of siege.

The first historic example of an *offensive* mine in warfare dates back to 430 B.C., when Servilius, besieging the Etruscans in Fidenae, dug an underground gallery through which his troops entered the heart of the city and captured it. Philip II of Macedonia, in the 4th century A.D., introduced the use of the *defensive* mine. In early times, it frequently happened that the besieged, aware of the mining operations against them, would sink shafts to meet the mined galleries. Through these shafts they then poured water, boiling pitch, red-hot sand or whatever refuse was at hand. Another favorite counterdevice was to fill a ditch with a smoldering wood fire whose smoke could be forced back into the attacker's underground tunnel. Under these ancient conditions, mine attacks had but one fixed objective, the destruction of a fortification or town which was the keystone of a given military position. In trench warfare of modern days, the object is to force the enemy back along a considerable front.

In the Crimean War, mining was extensively employed. At the siege of Sebastopol, over five miles of galleries were driven by the opposing armies in 10 months of underground warfare. In the American Civil War, the "crater" at Petersburg, Va., was an example of the effect of mining warfare, even though it proved to be without military value in this particular instance. In the Russo-Japanese War, at the siege of Port Arthur, underground operations played a prominent part, and it was here that modern high explosives were used for the first time in mine warfare.

From the close of the Russo-Japanese War until the outbreak of World War I in 1914, little attention was paid to instruction in mine warfare. This attitude reflected European opin-

ion of the times that, should the great powers go to war, everything would be settled by one short, decisive campaign. However, it did not work out that way since both sides began entrenching after the first Battle of the Marne. Eventually two great opposing trench systems swept from the English Channel to the Swiss border. The first intimation the Allies had that mining operations were to be reckoned with came in December 1914, when German mines were exploded in a planned attack in a number of sectors extending from Lorraine to Flanders. Soon both sides were using special mining troops, recruited from the ranks of civilian coal miners. Schools were established for officers and men. During 1916, the most active year in mining operations, 750 mines were exploded by the British and 696 by the Germans. By 1917, the British had gained control of the underground situation, and on June 7, 1917, they put on the greatest military mining operation in the history of warfare, when, at Messines Ridge, 500,000 pounds of explosives were discharged along 4,500 yards of front. This climaxed World War I mining operations which declined almost to zero after this event.

During the Spanish civil war mining and countermining were employed by the opposing forces in the siege of Madrid (1936-1938). However, in the immediately succeeding World War II (1939-1945) mining of the type developed during World War I was rarely used in either the European or Asiatic theaters. In France the previously built Maginot Line system and the Metz fortifications with their underground mines and galleries were utilized; but traditional mining operations were invalidated by the brief periods of siege warfare. Skillful use of natural caves by the Japanese was countered by air and artillery bombardment of the entrances and spraying by liquid fire. ROBERT S. THOMAS,
Associate Military Historian, Army War College.

MINGHETTI, mēng-gāt'tè, Marco, Italian statesman and writer: b. Bologna, Italy, Nov. 8, 1818; d. Rome, Dec. 10, 1886. Minghetti began his public career in 1846 by establishing a liberal journal, *Il Felsineo*, in Bologna. In 1847 he was called to Rome by Pius IX to become a member of the Consulta delle Finanze and in 1848 he became minister of public works. In 1859 he became Cavour's secretary of state for foreign affairs. On Cavour's death in 1861 he was regarded as the ablest representative in the Italian Chamber. In 1863 he became prime minister. He left office in 1864. In 1868 he was ambassador to London. He was ambassador to Vienna in 1870-1873; and from 1873 to 1876 again head of the cabinet. Minghetti's writings include *Della economia Pubblica* (1859); *La Chiesa e lo Stato* (1878); *Opuscoli letterari ed economici* (1872); and *Discorsi parlamentari* (1888-1890).

Minghetti was also a student of the fine arts, lectured on Dante and Raphael and wrote a book, *Le donne italiane nelle belle arte al secolo XV e XVI* (1877) and a biography of Raphael (1885).

MINGO JUNCTION, mīng'gō, town, Ohio, in Jefferson County; altitude 662 feet; on the Ohio River; 17 miles north of Wheeling, W. Va.

on the Pennsylvania; the Pittsburgh and West Virginia; the New York Central and St. Louis railroads. It has steamboat connections. It is included in Steubenville township. Huge steel works are situated here. Farming, dairying, and fruit growing are leading industries. Coal is found in the vicinity. A Mingo Indian village formerly stood on the site. Pop. (1950) 4,464.

MINGRELIA, mĭn-grĕ'ĭ-ă; mĭng-grĕ'yă, region, Georgian Soviet Socialist Republic, bordering on the Black Sea. In ancient times the district was known as Colchis, famous in Greek mythology as the home of Medea and the Golden Fleece, the goal of the Argonauts. To the Greeks, the province was famous as the seat of Dioscurias, (modern Sukhumi) a colony of Miletus, noted for its wines and fruits.

MINIATURE PAINTING (from the Latin *minium*, "red lead"), a painting on a very small scale. The word has its origin in the practice of embellishing books, in which the principal pigment used was red lead. Hence the Low Latin verb "miniare," to color with red lead, was applied to the art, and those who practiced it came to be known as "miniatori" (See MANUSCRIPTS, ILLUMINATED). Eventually the word was applied to all works of art of "miniature" size. Its principal meaning today is that of a very small portrait painting.

The early artists painted on vellum, and used body colors, for example, colors mixed with white or other opaque pigments and this was continued until the 17th century when thin leaves of ivory were substituted. Ivory was adapted to richer and more varied coloring; transparent colors were employed on faces and hands, while opaque ones were used for other textures. Another technique was that in oil on thin copper. From the use of miniature on boxes, watches, jewelry, etc., enamel came into favor too.

Illuminated manuscripts often contained portraits of authors or owners; suitable persons were represented on manuscript diplomas and other such documents. Late illuminators like Hans Muelich (1516-1573) and Giulio Clovio (1498-1578) have painted portrait miniatures. But most of the early work of this kind was done by great portraitists like Hans Holbein the Younger (1497?-1543), Lucas Cranach (1472-1553), Agnolo Bronzino (1502-1572); and great portraitists ever since occasionally have worked in miniature scale.

In England the tradition started by Holbein was continued by Nicholas Hilliard (1537-1619) who wrote a treatise on the *Art of Limning*, (ed. P. Norman, *Walpole Society*, 1911-1912) and Isaac Oliver (1556-1617). The transition to a new style, influenced by Sir Anthony van Dyck is made by John Hoskins the Elder (1620-1664); the style is fully developed by the brothers Cooper, Alexander (1605?-1660) and Samuel (1609-1672) by whom we have the likeness of Oliver Cromwell. Then follow Lawrence Crosse (1650?-1724) and Bernard Lens (1682-1740). A new impetus came with the prince of English miniature painting, Richard Cosway (1724?-1821) who combined English sentiment with French refinement. Followers of his were: Andrew Plimer (1763-1837) and John Smart (1741?-1811); a rival, who preferred a more sober style, was the court painter George Engleheart (1752-1829). Into early Victorian times reach the Scot, Andrew

Robertson (1777-1845) and the court miniaturist of Queen Victoria, Sir William Charles Ross (1794-1860).

The *United States* is best represented by the portrait painters, John Singleton Copley, Gilbert Stuart, and James Peale. Edward Greene Malbone (1777-1807), however, was the first great American miniaturist. Charles Fraser (1782-1860) and Jonathan Trumbull, his contemporaries, and later George Freeman (died 1906) deserve mention.

In *France*, one of the earliest examples is the selfportrait by Jean Fouquet (1416?-1480), in enamel, and this technique remained in favor there and elsewhere: Léonard Limosin the Elder, at Limoges (1505?-1575/77); Jean Petitot of Geneva (1607-1691) and his son, Jean Louis Petitot (1653-1699) who both also worked in England, and many others in the 17th and 18th centuries. Small portraiture, almost miniature-like was practiced in the 16th century in the workshops of the Clouet family and Corneille de Lyon. Typical of the 17th century miniaturist is Louis Du Guernier the Elder (1614-1659). Among the many miniaturists of the 18th century must be mentioned: Jean Baptiste Massé (1687-1767), Ignace Jean Victor Campana (died 1786), Hubert Drouais (1699-1767) and, the greatest of them, the Swede Pierre Adolphe Hall (1739-1793). The finest flowering of the art came in the period from Louis XVI to the Restoration, with Jean Baptiste Isabey (1767-1855), one of the most famous miniaturists of all ages, and his contemporaries J. B. J. Augustin (1759-1832), Jean Urbain Guérin (1760-1836), Ferdinando Quaglia (1780-1853), Jean Baptiste Singry (1782-1824), Louis Sicard (Sicardy, 1746-1825), and François Dumont (1751-1831).

In *Germany* and *Austria* the art was practiced by Ismael Israel Mengs (1688-1764), Martinus II Mytens (1695-1770), J. H. Hurter (1734-1799), active also in England, and above all the Viennese Heinrich Friedrich Füger (1751-1818) who followed English taste. Popular was Moritz Michael Daffinger (1790-1849).

In *Italy* only Rosalba Carriera (1675-1757) gained international fame.

The *Netherlands*, just as Italy, produced too many great portraitists to leave much room for this minor art, which was practiced by lesser men, for example P. Fruytiers (1607?-1660), and J. B. van Deynum (1620-1668).

Sweden, besides Pierre Adolphe Hall, had many good miniaturists—Arvid Karlsten (1647-1718), who also was a medalist; Erik Utterhjelms (1662-1717); the learned Elias Brenner (1647-1717), who wrote a Latin treatise on the technique (Stockholm 1680); Nils Lafrensen, father and son (1698-1756; 1737-1807) who were famous in Paris; and J. A. Gillberg (1769-1845).

In *Russia* many foreigners were active: the two Swiss H. F. G. Viollier (1750-1829) and N. Soret (1759-1830), the Italian D. Bossi (1765-1853) and others.

Except for miniatures in oil which mostly look like regular portraits reduced in size, miniature painting has a distinct style, which is characterized by a brilliant coloring in a light key, suggested by the technique, and by a minute execution of highest precision, required by the scale. The taste of the late 17th, 18th, and the early 19th centuries were susceptible to such qualities; and this accounts for the flowering of the art at this time. Such periods of refinement could

savor to the fullest the elegance, preciousness, and intimacy of this art; miniatures, often in precious settings on boxes, etc., then played a more vital part in every day life.

The invention of photography meant the end of miniature portraiture as a well defined art. It still was practiced, but either became a slave to photographic likeness, losing all style, or went to the other extreme by indulging in stylistic experiments not suited to the medium and purpose.

Miniature portraits in low relief, in wax (often elaborately colored), terracotta, Wedgwood ware, on coins and medals are akin to the painted ones, as are countless small portrait drawings, in black on parchment (for example, Vischer the Younger, Haarlem, (1618/29-1658/62) or in red and black on paper (Louis Carrogues Carmoulet, 1717-1806), and similar engravings (Charles Nicholas Cochin, 1715-1790).

In miniature scale, in the same techniques, many other subjects were painted: devotional subjects and mythologies (Joseph Werner II, 1637-1710; K. G. Klingstet of Riga, 1657-1734; Pierre Antoine Baudouin, 1723-1769); landscapes (Hans Bol, 1534-1593); animals and flowers, often as scientific illustrations (Maria Sybilla Merian, 1647-1717; Catherine Perrot, c.1680, from whom there is also a treatise on the technique); battle scene (Louis Nicholas van Blarenberghe, 1716?-1794); copies after famous pictures (S. F. Dinglinger, 1739-1791).

A special branch of miniature painting, technically related to enamel, is that on porcelain which developed during the 18th century in such factories as Meissen, Sèvres, Chelsea, and Capo dimonte. Tableware was decorated with miniature landscapes, pastoral and other scenes, flowers, birds, etc.; a great deal of imagination was spent on porcelain snuff boxes. Towards the end of the century and in the beginning of the 19th these decorations became increasingly like real miniature pictures, and on cups, for example, even portraits became the fashion. In the *Near East*, particularly in Persia and in India, portrait miniatures are found beginning with the 16th century. They have their origin in the rich secular book illustration of these countries and they were actually painted by the great miniaturists themselves. It is not always quite easy, however, to tell the borderline between illustration and portraiture, especially in Persia. Among the known painters there Ali Rizā Abbāsi (first half 17th century) should be remembered, to him are ascribed some of the finest examples known. In greater numbers portrait miniatures existed at the court of the Mogul emperors in India (16th-18th centuries), particularly those of the emperors themselves. They are true portraits and differ little in general character from their Western contemporaries.

MINIMUM THERMOMETER. See THERMOMETER.

MINIMUM WAGE, the lowest wage paid to workers by their employers permitted by legislative authority. In the modern concept of the term, the minimum wage is intended to be not merely commensurate with the bare cost of living but sufficient to ensure a fair measure of comfort and well-being in terms of the general standard of living. It is always difficult to decide what should be a fair minimum wage, because the cost of food, housing, fuel, and clothing differs widely in various countries and often in sections of a particular country. In general, living costs are lower in rural than in urban districts; also in the less industrialized nations than in those where industrialization is further advanced.

The growth of modern capitalism in the 18th and early 19th centuries, with its economic ruling concept of *laissez faire* and opposition to traditional governmental controls over commerce and industry, witnessed a like rejection of legislative authority to determine wage scales. Such authority had been a governmental prerogative at least since medieval times. France enacted a minimum wage law as early as 1270, while England enacted maximum wage laws in 1357 and 1536. The English laws, after being long inoperative, were finally repealed in 1813.

From early in the 19th century trade union policy has favored minimum wage standards, and trade agreements made between unions and employers have contained stipulations as to the minimum wage to be paid the workers.

The modern statutory minimum wage movement had its origin in Belgium in 1855 when the Belgian government in making contracts with private concerns for public works constructions inserted the so-called "fair wages clause," requiring that the contractor's workmen should receive at least the rate of wages usual in private trade agreements or paid by reputable employers. During succeeding decades the Belgian example was followed by other governments; but not until the last decade of the 19th century did any government extend the protection of minimum wage laws to the great mass of labor in private employment.

In 1894 New Zealand enacted a law requiring compulsory governmental conciliation or arbitration for settlement of industrial disputes, in effect giving the government authority to determine the minimum wage rate. Two years later the Australian state of Victoria passed the first legislative minimum wage act of modern times applicable to private employment. Similar acts were soon passed by other Australian states and New Zealand. In 1910 England adopted a minimum wage program. France, in 1915 and 1928, enacted minimum wage bills applying to home workers in the clothing industry. The discussion of minimum wage standards at the annual conferences of the International Labor Office in 1927 and 1928 focused world attention on the problem of underpaid workers in every industrialized country.

The United States.—The enactment of minimum wage legislation by states of the United States, like most other American labor legislation, followed an English precedent; minimum wage legislation by the states also long preceded federal legislation. Massachusetts, so often a pioneer in humanitarian causes, was the first state to enact legislation applicable to women and children, in 1912. Within the next twenty

years 14 other states, the District of Columbia, and Puerto Rico enacted similar laws. However, further extension of such legislation was checked when the constitutionality of the enactments was successfully challenged. Thus, the act passed by Congress in 1918 to govern wages paid to women and children in the District of Columbia was declared unconstitutional by the Supreme Court in 1923. New York's minimum wage law was likewise held unconstitutional by a Supreme Court decision of 1936. But a year later the Supreme Court reversed itself and declared a Washington State minimum wage law to be constitutional. The change of attitude of the court reflected the change from a conservative to a liberal majority of justices which occurred through new appointments in the first Roosevelt administration.

Although Congress in 1892 had established wage and hour standards applicable to employees engaged in work for the United States, it was not until 1931, with the passage of the Bacon-Davis Act, that it exercised any authority to establish wage standards for employees engaged in contract work for the government. The first attempt to regulate wage and hour standards for private employment was made by the National Industrial Recovery Act (NIRA) of 1933; but its far-reaching delegation of legislative power was clearly in violation of the Constitution, and its main provisions were nullified by a Supreme Court decision of 1935. The Walsh-Healey Act of 1936, providing terms for public contracts, in addition to limiting the work day to eight hours and the work week to 40 hours, stipulated that all persons employed by the contractor should be paid not less than the minimum wage prevailing in similar work.

The Wage-Hour Act of 1938, sponsored by President Roosevelt, established a 25-cents-an-hour minimum wage for the first year, with increase to 30 cents for the following six years and, after Oct. 24, 1945, 40 cents an hour (unless the Wage and Hour Administrator prescribed a lower minimum, but not less than 30 cents). The Fair Labor Standards Act of 1938 limited its application to businesses engaged in interstate commerce.

Amendments to the Fair Labor Standards Act in 1949 raised the minimum hourly wage to 75 cents. In 1955, Democrats and Republicans compromised on a further increase to \$1.00, effective March 1, 1956.

MINING, the removal of valuable mineral products from the earth. While in its narrower sense mining includes only the actual operations of releasing the mineral from its surroundings and raising it to the surface, the broad field of mining encompasses all procedures from the search for the deposit through the delineation and exploitation to the treatment of the product, on the surface of the earth, until it is in such physical condition or degree of purity that it may command a suitable market price. If such treatment extends to the point that the mineral loses its identity as a chemical compound, as in smelting or leaching, it has passed from the realm of mining into that of metallurgy. Mining operations are treated here in the following order: prospecting, exploration, development, mine plant, exploitation, mineral dressing, administration. The geology of ore deposits is discussed with prospecting and exploration.

PROSPECTING

Prospecting is the search for a new mineral deposit, and may include preliminary exploration. Intelligent prospecting is based on a knowledge of the geologic modes of occurrence of minerals. These modes are: (1) by weathering and erosion, either in place or transported; (2) by concentration in bodies of water on the earth's surface, by either organic growth in place, chemical precipitation, evaporation, or sedimentation; (3) by deposition from circulating ground waters, either from rock masses containing minor percentages of valuable mineral, or from those rich enough to be worth mining; (4) by deposition from heated waters rising from the interior of the earth; (5) by alteration of the original rock (country rock) due to the great heat of intruded molten materials and chemical reaction with those materials; (6) by segregation of the valuable materials in the molten rock (magma) of an intrusive, either in the main body of the intruded mass, or in fissures in the country rock into which the more fluid constituents of the magma (and thus the last to solidify) may be forced. Valuable deposits have been formed by each of these methods. Examples of those produced by weathering may be found in the rich iron ores of the Lake Superior district and the gold placers of California; most salt beds and all coal fields were concentrations in water on the surface; the lead and zinc ores of the Mississippi Valley are usually considered to have been formed by circulating ground water, as were the enriched ores of copper mines in Arizona at Ray, Miami, and Bisbee, among others; rising heated waters formed the mercury deposits of Spain and the gold-bearing veins in the Black Hills of South Dakota; contact metamorphism resulted in the primary copper ores at Bisbee, Arizona, and the iron deposits at Cornwall, Pennsylvania; the titanium-bearing iron ores at Lake Sanford in New York and the nickel deposits at Sudbury, Ontario, may have been formed by magmatic segregation.

Prospecting was formerly carried out by individuals or very small groups, usually men of no training and often little experience in mining, called sourdoughs, searching for valuable minerals in the sands and gravels of stream beds or for outcrops, or surface exposures, of the solid mineral. Much prospecting is still done in this way, not infrequently by men with little formal training in geology, but the trend in surface prospecting is for large mining companies to send parties headed by geologists into promising areas. One method of prospecting is by studying the coarse and fine stream gravels, concentrating the heavier materials in the fine sands by "panning," or washing in a shallow iron pan. By careful manipulation, even very fine particles of gold and platinum can be retained in the pan while much larger grains of sand are washed over the edge. Materials less dense than gold, such as silver, copper, and most metal-bearing ore minerals, can be retained in the pan if the particles are not too much smaller than the sand grains. If valuable mineral is found, the party works upstream, testing each branch on the upper side of each junction to determine from whence the material came. When the desired mineral is no longer found the party works downstream, testing at close intervals until the valuable mineral again appears. From this point the ore particles, or

float, are traced up the slope of the valley wall by sinking pits in the soil at intervals from the stream, the soil from each pit being tested intermittently until float is obtained, then a new pit is dug higher up the slope. The series of pits is continued until one is dug to bedrock without finding float. If the soil is not too deep, a trench is now dug to bedrock between the last two pits to find the deposit; where the cover is too deep, intermediate pits may be dug, or a tunnel driven between the pits. While this procedure is simple and appears to lead directly to the source of the float, the infinite variety of relationships possible between topography and underground structure often impedes the search. The source of the California placers made famous in 1849 was sought for years before it was found.

Another surface method is to examine outcrops instead of or in addition to tracing float. In Northern Rhodesia an area to be prospected was laid out in parallel strips. The European geologist walked the baseline of each strip, paralleled by natives carrying hammers. Every exposed rock was sampled, and each sample was brought immediately to the geologist. Promising outcrops were studied in detail, and a major copper deposit was discovered. Intelligent evaluation of outcrops can indicate the wisdom of further exploration when valuable minerals are not actually found in the exposed rock or are in quantities too small to appear worthy of consideration.

Geophysical prospecting methods can indicate the presence of an ore-body or of a sub-surface structure favorable for the formation of an oil or gas deposit when there is no surface indication. Probably the first such method was the use of a magnetic needle similar to a compass needle but mounted on a horizontal axis. This dip-needle gives practically uniform readings in most areas, but dips more or less steeply over the various parts of a deposit of magnetic iron ore. Compass needles, too, are deflected from their normal position by such deposits, and sensitive instruments called magnetometers now indicate even slight variations of the horizontal and vertical components of the earth's magnetic field. As all substances are susceptible to magnetism to a varying degree, any variation of composition and structure underground may have a magnetic effect at the surface.

Another surface manifestation of lack of uniformity underground results from a body of greater or less density than the surrounding rocks. A large body of ore of specific gravity 4.6 in rocks averaging about 2.9 would increase the pull of the earth on any body located above it, at the surface, or would exert a sidewise pull on a plumb line located off to one side, in accordance with the formula $F = g \frac{m_1 m_2}{r^2}$, where F

is the force of attraction, g the constant of gravitation, m_1 and m_2 the masses of the two bodies being considered, and r the distance between their centers of gravity. Because the mass of the earth is tremendous compared to that of even a very large body of dense material, the effect on gravity of mineral deposits is on the order of magnitude of one part in a million. Gravitational surveys can be conducted with a torsion balance, a pendulum apparatus, or a gravimeter, of which there are several types. The torsion balance has been little used in the United States since the middle 1930's.

Minerals differ in their electrical conductivity and in their dielectric constant, or ability to store electrical charge. Some, under favorable circumstances, will actually generate a current of electricity due to chemical reaction with ground water, in a manner similar to the operation of a battery. Measurements of resistance or of current flow (natural or impressed) may indicate underground deposits. Coal beds, for instance, easily carry currents, while quartz veins offer high resistance to their passage. The dielectric constant of a deposit influences the passage of radio-frequency waves; this principle was applied in detectors for non-magnetic land mines during World War II.

The speed of elastic waves in rocks is a function of their elastic properties, which differ with different kinds of rocks and are affected by discontinuities such as bedding planes. If a charge of dynamite is exploded on the surface, a wave will proceed outward from the point through the surface soil just as waves spread from a pebble dropped in a pool. This wave will be detected and recorded by a seismograph some distance away. However, if there is a stratum of rock a short distance below the surface, it will transmit a wave to the instrument more rapidly than the surface wave is carried. Use of waves in this manner is known as refraction, and it has been much used in the past to locate salt domes, on the flanks of which oil deposits are sometimes found. Currently, reflection shooting is more commonly used. This method is based on the principle that as a wave moves downward through sedimentary rocks a portion of the energy is reflected from each succeeding stratum in much the same way as a window-pane reflects part of the rays of the sun while transmitting the remainder. Inclination of the beds from the point of the explosion upward or downward toward the location of a series of seismographs will cause a differing relationship between the times of arrival of the various reflected waves. This difference recorded by the seismographs indicates the underground structure which caused it. Structure favorable to the accumulation of oil indicates the possibility of sinking a producing well.

There are other geophysical methods of prospecting, which do not enjoy the wide application of those just described. None of these methods provides a positive indication of the presence of oil, gas or metallic ore, but merely the possibility of finding a deposit after careful surface or underground prospecting. —

EXPLORATION

The determination of the extent and quality of a deposit is termed exploration. A property at this stage is referred to as a prospect because of the prospective future income. If a bed, seam, or vein extends to the surface, its extent, where the soil is reasonably shallow, is determined by digging a series of trenches across it at suitable intervals. Pits or shallow shafts are used where the cover is deeper, with short tunnels or cross cuts driven out on the surface of the bedrock to determine the limits. The actual extent of the deposit within the country rock is best determined by a combination of vertical, inclined, and horizontal workings, most driven along the boundary between ore and rock, but some entirely in ore, to determine its width and to connect various galleries for convenient access. Workings are also driven in barren rock to make

contact with other bodies of ore known or suspected to be nearby, or to find a continuation of the body being explored where it has pinched out or else been cut off by displacement along a fault.

A less exact method of delineation, but much cheaper, is by using drills. Bedded deposits lying near the surface may be explored cheaply by use of a well drill, which can drill vertically downward only. Of more universal application is the core drill with a diamond-set bit, which drills at any angle, can be set up in a restricted space, and is obtainable with a gasoline motor for surface work, or a compressed-air motor for surface or underground use. The cores obtained give an excellent picture of the composition of the rocks drilled. Because the holes are not

majority of the capital investment in the mine. When practicable, they may be driven in the ore body to provide some return on the investment; but, since they must not weaken the rock structure to such a degree that the lives of the workers are endangered or the maximum recovery of ore may not be realized due to early collapse, this practice is not so wide-spread as might be expected. Where adequate capital is available, it is often more economical to do practically all of the development in the country rock, particularly if the deposit is weak structurally. On the other hand, in flat bedded deposits, such as coal, the practice is to do all development in the valuable seam if it is thick enough. In such cases the development work often shows a profit.

Fig. 1. Development workings in metal mines.

straight, but wander considerably from the original direction line, the picture of the structure obtained by careful plotting of the drill core composition on vertical and horizontal projections is not strictly accurate, and proper interpretation requires experience and a sound knowledge of geology. With very thin and irregular deposits, such as thin veins of the precious metals, this method of exploration is especially unreliable, as it may indicate too high a quantity of metal by following the softer material of a rich veinlet, or it can completely miss the valuable parts of the ore body, giving no indication of their presence.

To enable more exact plotting, instruments have been devised for surveying boreholes with a high degree of accuracy. A recent development is a camera which takes a series of 360 degree photographs of the interior of a three inch diameter borehole, thus making a record of the entire interior.

DEVELOPMENT

Development is the driving of those workings necessary to remove the ore from the deposit (Fig. 1). Most exploratory galleries are later used in the exploitation; thus, a mine is referred to as being in the "exploration and development stage" because the exploration workings being driven are part of the development plan. These openings must provide means for the miners with their tools and supplies to enter the working places where the mineral will be mined, they must make possible the easy removal of the mineral to the surface, and they must be so planned that fresh air can be brought into the workings while foul air and water are separately removed from the mine. While filling these conditions, the development workings must also be planned with a view to economy, as they usually represent the

Principal access to a deposit may be through a horizontal opening, such as a drift in coal mining or an adit in metal mining, where the deposit is above the valley bottom. If the mineral is found below drainage, a vertical or inclined shaft may be sunk to the desired depth before horizontal workings are driven. Shafts must be planned to provide compartments for hoisting ore; for hoisting and lowering men, equipment, and supplies; for compressed-air, fresh-water, and mine-water pipes, power cables, and telephone and hoisting-signal wires; for ladderway for inspection, repair, and emergency escapeway; and for fresh or used air when the shaft is used for ventilation. Vertical shafts are easier to sink and maintain; hoisting in them is much safer and more rapid than in inclined shafts. Their chief disadvantage is that when the dip angle between the ore body and the horizontal is much less than ninety degrees, it is necessary to drive long horizontal openings from the shaft to the ore body. Under such circumstances it is often more economical to sink the main shaft part of the distance, drive a main haulage level toward the ore body, and sink a blind shaft, called a winze, from there to the lower levels.

Shafts are sunk in rock by drilling a round of holes, usually with compressed-air hammer drills, loading with a high explosive which is blasted after the working crew is withdrawn from the shaft, and removing the broken rock by hand- or power-shoveling into buckets and hoisting to the surface. The sides are supported by a framework (called timbering) of wood, steel, or reinforced concrete, or by a full lining of one of these materials, of brick or stone masonry, or of cast iron sections. The degree of support required is dependent on the rock; firm, solid rock requires little support, and in shallow shafts the

main purpose of the timbering is to guide the cages or skips used for hoisting and to support the ladder, pipes, and cables; in weak or fractured rock more support is required; and in sand, loose earth, quicksand, or rock carrying large quantities of water, full linings are needed. The difficulties of sinking the shaft are proportional to the amount of support required. Badly fractured rock or dry sand may have to be solidified by pumping in a thin cement-and-sand slurry ahead of the actual excavation process; this grouted rock must then be drilled and blasted. Quicksand can be frozen and removed like rock, or a drop-shaft of steel or concrete may be constructed on the surface and allowed to sink to bedrock as a bucket excavator removes the sand inside the casing. If large boulders are encountered it may be necessary to convert the drop-shaft into a caisson to permit men working under air pressure to drill and blast the boulders.

The shaft cross-section may be rectangular, circular, elliptical, or rectangular with rounded ends. Rectangular shafts are most easily divided into compartments, while circular shafts offer the most resistance to crushing, require the least lining material for a given size opening, and, in the case of a ventilating shaft, give the highest air-flow capacity for the amount of material excavated. Elliptical and rounded-end rectangle shafts are compromises.

Horizontal development openings in coal mines are called entries; in metal mines those parallel to the main trend of the ore body are known as drifts (or drives in parts of the British Commonwealth), and those not parallel are crosscuts. A series of drifts and crosscuts at one elevation used as the means of access to the ore body from the shaft is a level; a series not connected directly to the shaft, used to facilitate the removal of the ore, is a sublevel; a level at which ore is collected from several levels and hauled to the shaft is a main haulage level.

FIG. 2. Room-and-pillar mining.

Drifts and crosscuts, like shafts, are driven by drilling and blasting. The muck is then loaded into cars by hand or mechanical shovels. The workings are inclined toward the shaft so any water will drain to the sump; the slope is usually planned so it is as easy to haul a loaded car down grade as it is to haul an empty one up. Where these workings are driven in the country rock they are made as small as is suitable for the use planned for them, to reduce the cost and simplify the problem of roof support. In coal mines the entries are usually as wide as they can be made and still remain open over long periods, because by so doing greater ventilating capacity is obtained and more coal is mined in the operation for each dollar of cost.

In development for open-pit mining the deposit

must be cleared of vegetation and top-soil, and access roads prepared. If the deposit is on a hillside the sloping rock surface must be excavated into a series of benches wide enough for drills, power shovels, and trucks or ore cars to work and not interfere with each other.

MINE PLANT

The mine plant includes all of the structures and machines used around the mine. See also MINING MACHINERY AND MILLING MACHINERY.

Electric power for a mine is obtained from commercial producers when available, otherwise it is generated on the site by steam, gasoline, or diesel driven generators. The power is frequently transmitted underground at high voltage by cables in the shaft or lowered through boreholes, with underground transformer stations for reduction to operating voltages. Direct current is especially popular in coal mines because variable-speed motors are used on locomotives, coal drills, undercutters, and loading machines. Rectification is performed underground or on the surface by vacuum-tube rectifiers, motor-generator sets, or rotary convertors; the rectifiers are becoming increasingly popular, and have the advantage for coal mines that there is less danger of igniting explosive mixtures of mine gases.

Compressed air is not commonly used in coal mining, but in metal mines it is the customary source of power for rock drills, loading machines, and scraper hoists, and sometimes for locomotives and for the hoist engines at underground hoisting stations. Compressor stations may be located at the surface, but underground compressors, driven by high-voltage motors, have the advantage of shorter piping systems and consequently reduced distribution losses.

Ventilation is provided by either centrifugal or axial-flow (propeller) fans. The latter type, brought to a high degree of efficiency about 1936, has become increasingly popular for that reason. All fan installations should be designed to permit reversing the air current in case of fire or explosion on the intake airway.

Coal mine fans are required by most state laws to be outside the mine because of the danger of gas or coal-dust explosions. At drift mines they usually operate exhausting, and fresh air enters along the haulage entries. At shaft mines good practice makes the hoisting shaft an intake, and the fan operates exhausting at a separate ventilation shaft; at large mines, however, economical ventilation requires additional inlets, and thus blowing fans also are used.

Most metal mines require less air than coal mines because explosive gases are quite rare; this condition also permits underground fan installations and the use of the main shaft as a return airway, which contributes to the comfort of the men working at the shaft bottom in cold climates. Large quantities of conditioned air are required for cooling in hot, deep mines such as those of the Rand in South Africa. Air is distributed in metal mines by making levels alternately intake and return, or by providing special galleries to carry the used air to the upcast shaft.

Transportation includes horizontal movement, or haulage, and vertical movement, or hoisting.

In small and medium-size open-pit mines truck haulage is the rule, diesel trucks holding from 15 to 30 tons being preferred. In the largest pits, rail transportation is used for ore and rock haulage and trucks are used for service.

Rail haulage in coal mines, formerly universal, is being replaced at the working face by shuttle cars, self-propelled cars with conveyor bottoms for unloading, and by room and gathering conveyors, which may be of the belt, flight, or shaking type. For main haulage, rail transport with cars up to 30 tons capacity is still of major im-

FIG. 3. Bord-and-pillar mining.

portance, but in many cases it is losing ground to belt conveyors where short hauls are involved, and in coal seams that are inclined at angles too steep for rail haulage, or where the coal lies near enough to the surface to make the use of an incline with a belt conveyor more economical than hoisting cars in a vertical shaft.

In most other underground mines rail haulage is used. Cars vary in size usually from $1\frac{1}{2}$ to $7\frac{1}{2}$ tons or larger. In thick horizontal deposits, such as limestone and salt, diesel or electric trucks are often used.

Cages may be constructed to tilt, dumping the car at the surface with minimum delay.

Hoisting engines are usually driven by steam or electric power, although gasoline hoists are commonly used during exploration, and air hoists at underground stations. The hoisting rope, made of the finest grade of steel, is wound, in most cases in a single layer, on a smooth or grooved drum which may be cylindrical, conical, or a combination to share the low first cost of the cylinder with the operating economy which is attained with the cone. The cone also requires a smaller motor for the same hoisting capacity. Two drums are mounted on one shaft, and the weight of the empty skip or cage descending in one shaft compartment helps to raise the load in the other. If only one cage is used a counter-balance is desirable. Tapered ropes reduce dead load at deep shafts, but are not used in the United States. Hoisting load may be equalized in other ways. The simplest method, which provides perfect equalization, is to use a tail rope connected to the bottoms of the two cages working in balance and riding under a large sheave in sliding bearings at the shaft bottom. Another method is to use a flat rope winding on a reel, which in effect is similar to a conical drum; the rope may be tapered. These practices have never found wide acceptance.

Some electric hoists have been made semi-automatic in operation. The motor is started by the man who fills the skips underground, and is stopped automatically when the skip is dumped, after controlled periods of acceleration, high speed deceleration, and low dumping speed.

FIG. 4. Open stopes: A, overhand stope; B, underhand stope (a, manway and timber chute; b, pillar; c, stull; d, ore loading gate).

Mine cars can be hauled up inclined shafts singly or in groups, or their contents dumped into bins and loaded into special cars permanently fastened to the hoisting rope. With vertical shafts the cars are raised in cages of one to four decks, or else the ore is hoisted in skips, which are large buckets equipped with shoes to ride on guide timbers in the shaft and designed to dump automatically at the surface. Because of the reduced dead weight, skips are widely used, especially for hoisting from deep mines, but they are not often used at coal mines because the extra handling breaks up the large coal, which usually brings a higher price. Skips are sometimes suspended below a cage of conventional design, permitting the same unit to serve for ore, men, and materials; this practice increases the dead load and is avoided where possible.

Headframes are constructed over hoisting shafts to support the sheaves over which the hoisting ropes travel, the vertical and dumping guides for cages and skips, and the ore receiving bin, and to provide a cover to prevent people and objects from falling down the shaft. They may be made of wood, but are usually of steel because of greater strength, longer life, and elimination of fire hazard. Reinforced concrete has been used also.

Other structures found at the surface of most mines include: office building, change house, maintenance shops, warehouse, assay laboratory, crushing plant, concentrator, and explosives magazine.

Pumping stations are located near the shaft at the bottom level, and at intermediate levels when it is possible to gather sufficient water there

for economical pump operation, or when excessive depths or other considerations made pumping in several stages advisable.

Mine pumps have varied widely in design, but most new installations use electrically driven centrifugal pumps unless the quantities involved are small and the vertical lift is high. Multistage pumps are used for high lifts. Water is collected in sumps, either below the level of the pump room, or behind dams and at the same or higher elevation. Pumps are usually controlled automatically.

EXPLOITATION

Exploitation is the removal of valuable mineral from the earth. The methods used vary widely with the nature and value of the deposit, and are so varied that only a few representative types can be described here.

Placers.—Deposits of sand or gravel containing valuable mineral particles are known as placers. Gold bearing placers, if rich enough, can be mined by hand shoveling, using pans, rockers, or sluices for concentrating. For larger-scale work the gravel is washed into sluices by heavy streams of water from hydraulic giants, or is mined by power shovels loading into cars or trucks. Deposits are mined by dredges when they are flooded or a lake can be made by damming a stream; the dredge contains the concentrating equipment, and deposits the barren gravel behind it as it progresses through the deposit.

Open-pit Methods.—These are used where deposits are of reasonable lateral extent and are not covered too deeply with overburden, or where they lie on a hillside. When benches have been developed blastholes are drilled, usually by churn drills vertically downward, from 15 to 50 feet in from the edge of the bench; in other cases compressed air drills are used, and both vertical and either horizontal or inclined holes are made. The broken ore is loaded into cars or trucks by

As the pits become deeper haulage becomes more difficult, and sometimes it is necessary to blast the ore into funnel-topped raises leading to an underground haulage system. These raises are called mill holes, or, because of the danger involved, glory holes. This method cannot be used if the ore tends to pack.

Stripping, or course stacking, is a special type of open-cut mining applied to extensive thin horizontal beds such as coal. In this process a wide strip of the coal or other mineral is exposed by removing the overburden, after blasting if necessary, with either dipper shovels or drag-line excavators. These machines have long booms, and bucket capacities of as much as 45 cubic yards. Part of the exposed coal is mined out by blasting, then loading with smaller shovels, and the stripping shovels, moving on the portion of the bed still exposed, uncover to the original width, stacking the removed waste in the space left as the coal was mined. Thus, no waste need be hauled away. This type of mining has been highly developed in Europe, where a wide variety of specialized excavators have appeared.

Room-and-Pillar.—This type of mining and its many variations are used in relatively thin beds which lie horizontal or at slight to moderate dips, such as coal, salt, and limestone beds. Rooms are driven parallel with pillars between; when the rooms are completed the pillars may be robbed and the overlying rock allowed to cave, if the work can be done with safety (Fig. 2). In strong formations such as limestone the pillars take a more-or-less circular cross-section and are relatively far apart; if the rock is mineral-bearing the pillars are left in barren rock where possible, and the pillar pattern is less regular. In coal and other weak materials the pillars are larger and closer together. Bord-and-pillar systems (Fig. 3) are used where the coal is very weak; after the narrow bords are

Fig. 5. Flat-backed stope.

electric or diesel shovels. Loose rock is scaled down from the face by the shovel bucket if the benches are not too far apart; 40 feet is a common spacing which permits this type of scaling, although 225 foot benches have been used, requiring hand scaling by men working on safety ropes. Common dipper sizes are $\frac{3}{4}$ to 5 cubic yards. Bulldozers pile the scattered ore for the shovels, and clear roads for the trucks to prevent tire damage which can become prohibitively costly.

driven, the pillars are mined so the roof caves along a straight line, relieving the pressure on them.

In mining coal and other soft materials the seam is usually undercut by machine, and the mineral is then drilled and blasted. Attempts to mine coal by machines which break it free of the seam without using any type of explosive were attracting widespread attention in the United States in the late 1940's. In Europe such machines had been developed earlier and had gained

considerable success, largely because they are better suited to the longwall methods used there in preference to the room-and-pillar systems which are almost universal in the United States. See also COAL.

Longwall Mining.—Coal is mined by this method which is characterized by a continuous face without pillars extending around the entry shaft. In advancing work the mining goes outward from the shaft, and the roof is allowed to settle slowly onto a pack built up of waste rock from the mining operation. In retreating operations the roof is allowed to subside onto the floor or such waste rock as may be produced. A flexible roof is almost a prerequisite for this type of mining, but it has been carried out under brittle roofs by causing the rock to cave at some distance from the face while supporting it over the working area.

Where hand methods of mining are used the face is undercut and roof pressure is allowed to break the coal, making drilling and blasting unnecessary and giving a large quantity of lump coal. Where machine methods are used a plan of the workings resembles a more-or-less regular polygon, the sides of which, sometimes 1,000 feet or more in length, are ideal for continuous mining machines, which break down the coal and deliver it onto a conveyor laid along the face.

Stoping.—The removal of mineral by driving, by drilling and blasting a series of horizontal workings steplike in ascending (overhand) or descending (underhand) sequence is called stoping. This method of exploitation is used in ore bodies of relatively steep dip or of considerable thickness. The deposit is divided into stopes by pillars, and each stope is worked by one of the various stoping procedures.

Fig. 6. Rill stope.

Open stopes (Fig. 4) are more frequently used in thin veins. Their name comes from the lack of complete timber support or rock fill to maintain the workings, which rely on the pillars only or on a few timbers, called stulls, across the stope to prevent collapse. In relatively horizontal beds the work resembles room-and-pillar mining, but because of the thickness of the bed it is not mined in one cut from top to bottom, but is taken in several layers. In steep veins the miners lay planks on the stulls to provide a platform in overhand stoping.

Timbered stopes are those in which large quantities of timber are used to prevent caving. Open stopes with many stulls grade into stilled stopes, a type of timbered stope. In thicker ore bodies timber support is given by the use of square sets which are assembled to fill the opening with a cubic lattice, the vertical posts resting

on a square grid of girts and caps. The system may be modified to give triangular frames for greater strength. Both stilled stopes and square-set stopes may be left open if the ground will hold, or may be filled as the work progresses, or on completion of the stope, with crushed rock or with fine waste from the concentration plant.

Filled stopes include both filled timbered stopes and stopes which are filled as they are mined without appreciable timbering. The latter are always mined overhand, with the miners standing on the fill, onto which the ore is blasted. In flat-backed stopes (Fig. 5) the broken ore is then mucked into wooden chutes leading to car-loading points, by shoveling or by use of drag scrapers, the chutes are then extended, and more fill is brought in. In rill stopes (Fig. 6) the ore slides on the waste to the loading chute. If the ore is rich, boards may be placed over the fill before blasting to prevent loss; in other cases, where waste and ore are cheaply separated at the concentrator, a layer of waste is scraped into the chutes with the ore. After a stope is completely mined and filled all pillars are sometimes mined out and filled in turn.

Rock fill may be quarried at the surface, sorted out of the ore underground, or mined out of the barren rock underground.

Shrinkage stopes are overhand stopes in strong ground in which the broken ore is allowed to accumulate, enough being drawn off after each blast to give the miners room to work as they stand on the ore. When the stope has been completely mined the ore is drawn off; the stope may then be filled or left open.

Top slicing is a stoping method used in ore bodies relatively large in all directions, so named because slices are taken from the top of the ore body.

The principle of this method is shown in Fig. 7. First a raise is driven containing a manway, timber chute, and ore chute from the haulage level to the top of the ore body. From this point drifts are advanced to the ends of the stope, which frequently are the ends of the ore body, and crosscuts are run from the drift ends to the contact between ore and country rock. If the stope is very long, ore chutes may be raised to the drift at intervals. As the work advances, heavy plank is laid on the floor, posts are set up on the planks, and cap timbers are laid on the posts to support the top. As a crosscut is completed, a new one is driven beside it, and is timbered as it is advanced. The ore is shovelled or scraped to the ore chutes, and the posts on the far side of the first crosscut are pulled or blasted down, allowing the top to cave in on a mat of timbers. Crosscuts are driven successively toward the center of the stope, and as the slice nears completion a new slice is started by driving drifts immediately below; several slices may be worked at one time, the workings of each one being nearer the central raise than those of the next lower slice. The workings are covered with an ever-increasing layer of tangled timbers.

Sub-level caving is a modification of top-slicing in which the drifts and crosscuts of successive slices are driven under a few feet of ore, which is made to cave by pulling out the vertical posts and caps supporting it. This method requires less drilling and blasting and less timber than top-slicing.

Block-caving is a stoping system in which the ore is divided into blocks, 100-250 feet wide, 100-

Fig. 7. Top slicing: a, posts ready for blasting; b, completed crosscut; c, crosscut being driven; d, completed drift; e, drift being driven; f, newdrift.

400 feet long, and 30-600 feet high. An example is shown in Fig. 8. These blocks may be loosened from the surrounding pillars or country rock by driving shrinkage stopes at intervals up the sides and ends. The ore must be of such a soft nature that it will cave of its own weight into a network of hoppers prepared under the block, and will break into small pieces as it passes from the hoppers downward through finger raises into merging chutes (transfer raises) leading to the loading pockets as much as 130 feet below the bottom of the block. Caving may be started by driving drifts or cross-cuts directly over the centers of the hoppers, then drilling the pillars between the drifts and blasting them out. Caving proceeds until the caved ore, which occupies more space than the solid ore, fills the opening and supports the hanging block. As ore is drawn into cars many feet below, more ore caves into the space provided. This is a very economical method of mining, but, like most other types, requires a special combination of natural conditions in the deposit.

Blocks may be filled with cap rock which caves as the ore supporting it is withdrawn, or rock fill may be introduced. Pillars between blocks are mined after the fill has had several months to become stabilized.

Fig. 8. Block caving system.

All of these methods of exploitation are modified to suit the conditions of the individual deposit, and combinations of methods are used wherever greater safety or economy can be obtained by so doing.

MINERAL DRESSING

The product of a mine may, and usually does require treatment to put it into proper condition for use by the immediate consumer. Coal must have slate and bone removed to prevent formation of ash and clinker, and it must be sized so it will burn properly in the furnace of the consumer. Rock must be crushed and sized for various uses. Metalliferous ores as mined are in most cases of too low grade to be treated economically at the smelting plant; discarding of waste at a mineral dressing plant, or mill, in the vicinity of the mine saves not only the extra smelting cost, but also the freight charges which would have to be paid on the discarded material if it were not removed.

Mineral dressing operations consist primarily of comminution, or severance, to release the particles of valuable mineral from the waste material and concentration, or separation, to divide the broken material into valuable and worthless fractions. The first of these operations is carried out in crushing and grinding machines, frequently aided by sizing machines to prevent excessive breakage of the material. Concentration is carried out by hand sorting and by a variety of machines which separate the different minerals because of their varying physical properties. Color, luster, specific gravity, and magnetism were the properties of importance in concentration until the beginning of the 20th century, but in the succeeding fifty years such properties as electrical conductivity, elasticity, friction, friability, and surface characteristics that cause substances to be wetted by a fluid or to remain dry have been made the basis of machines and processes for concentration. See also MINING, MACHINERY AND MILLING MACHINERY.

Besides the comminuting, concentrating, and

sizing machinery mentioned, there must be other equipment in the mill for transporting and storing the ore in process, for removing excess water, or even drying it, and for taking samples at critical points in the process. The coarse and fine waste products must be removed from the plant and stored, usually permanently; fine waste frequently is a source of stream pollution and may thus cause expensive litigation. Where possible this material is used for mine fill, but often the milling processes do not remove all of the valuable mineral from the ore, and the waste, or tailing, is placed in temporary storage for a few years or several decades until discovery of a more efficient concentration process makes it possible to extract more of the valuable mineral at a profit.

MINING ADMINISTRATION

Organization.—A mine may be owned or operated, or both owned and operated, by an individual, a partnership, or a corporation. Many manufacturing companies own and operate the mines which supply their raw materials; these are called captive mines. A mining industry faces a peculiar set of financial problems due to the fact that its assets, in the form of mineral deposits, are constantly diminishing, even though the known deposits, or reserves, may be enlarged by new discoveries on the property. Furthermore, many deposits of large extent and apparent value cannot be mined economically because of unfavorable geologic conditions, or because no system of mineral preparation has been developed to separate the constituents of the ore without excessive cost.

A mining company usually operates one property under a manager who directs the operations of the mine and preparation plant. A maintenance department keeps the equipment in operating condition, the elaborateness of the shop facilities increasing with the size of the operation and the remoteness from sources of supply. Headed by an electrical and a mechanical engineer, this department should include a timber and carpenter shop, a blacksmith shop, machine shop, electrical shop, vehicle maintenance shop, and steam, water, and power plants. The accountant often has charge of purchasing and the warehouse. Usually the company has its own doctors, nurses, and hospital. A town and stores may be constructed and owned by the company, but the trend is to dispose of all such holdings. An engineering department including mining engineers, geologists, surveyors, samplers, assayers, and mineral preparation engineers provides technical guidance for the manager and the operating departments. This department may design all structures and many machines for the special conditions prevailing at the property. See also MINING ENGINEERING.

Because mining depletes the natural resources of the country, special laws are enacted to control it. See also MINING LAWS. The special hazards of mining have caused the passage of laws in most states to provide for minimum safety standards, and mines are subject in addition to laws governing industry in general. The accounting system, besides offering ready information to be used in cost analysis to improve operating efficiency, must supply all data required for compliance with these laws.

Mine Safety.—This important factor in mining has received increasing attention since early

in the 20th century, and substantial progress has been made in reducing fatal and lost-time accidents. While the public eye is quickly focused on spectacular mine disasters such as coal mine explosions and mine fires in which occasionally one hundred or more men are killed at one time, the total number killed in small accidents in any year is far greater and warrants proportionally more attention to the means of reducing the frequency, both in number of accidents or fatalities per man-day worked, and in the number per unit of production.

Progress in mine safety is attained by continuous attention to accident preventatives, such as the proper selection, training, and discipline of workers; the provision of a plant with proper arrangement, safety devices and warning signs; the wise use of incentives to work safely, such as competitions and bonuses; and, above all, a true "safety-mindedness" on the part of management, reflected in ardent support of the program. A safety engineer of mature judgment, respected by his colleagues, and with authority to enforce his decisions can do much to plan and execute an effective safety program.

Closely allied to safety is the health of the miner. Hazards peculiar to the industry or of greater-than-average severity when encountered in mining are numerous. Because of the dark and sometimes damp working places and the abrupt changes of temperature when entering or leaving the mine, pneumonia, rheumatism, and tuberculosis are more common than in many other industries. The extended workings foster laxness in sanitary precautions, and thus hookworm disease and typhoid fever may be spread.

Where free silica is encountered in the rock, silicosis, a laceration of the lung tissue, is caused by inhaling very fine particles of quartz. The illness can be fatal unless detected in time and its advancement checked by change of occupation; at one time it caused more fatalities than all types of mining accidents. The hazard is reduced by use of wet drilling methods and by wearing respirators, and medical research is developing improved methods of treatment. In lead mines where the carbonate occurs, lead poisoning may result from inhalation or swallowing. Mercury poisoning is a great hazard where cinnabar is mined, and ores containing arsenic are also dangerous.

Gases occurring in mines present a dual hazard of poisoning and explosions. Carbon monoxide, dangerous in concentrations of 3/100 of 1 per cent or more, depending on the period of exposure, is formed by blasting, mine fires, and explosions. It is difficult to detect, and canaries or mice were long carried into mines for this purpose, since, being more easily affected than humans by the gas, their distress or collapse gave warning of danger. Nitrogen trioxide and tetraoxide, which are formed when dynamite burns instead of detonating, are poisonous gases which have caused a number of deaths. Hydrogen sulphide, more deadly than carbon monoxide, is fortunately seldom encountered in mines.

In coal mines and some metal mines methane (firedamp) is encountered; this gas forms explosive mixtures in air when it makes up from 5.0 per cent to 13.9 per cent of the mixture. Explosion of a small pocket of methane can stir up fine coal dust and ignite it, causing the explosion to extend through a large part or all of the mine with loss of many lives and much

property. Coal dust suspended in the air may ignite when gas is not present, but it is believed that most explosions were started by ignition of gas, and that almost all severe ones developed into dust explosions. The most severe mine explosion on record occurred in France on March 10, 1906, when 1,110 persons were killed at Courrières. In each of five other disasters 300 or more persons were killed.

During the years 1902 through 1918 there were 25 major explosions (100 or more fatalities) in coal mines throughout the world, killing 5,717 persons. Their frequency caused widespread agitation for corrective legislation, which caused a great improvement in mining safety statistics, both in the number of explosions and the number and severity of other accidents. In the United States, for instance, the fatality rate has been reduced from 1.93 per million man hours in 1911 to 0.90 in 1950, and from 5.00 per million short tons of coal mined to 1.15, in the same period. In 1951 there were 791 fatalities in the coal mines of the United States, of which 367 were due to falls of coal or rock from the roof or face, 158 were caused by major explosions (5 or more men killed) 5 by minor explosions, 119 in haulage accidents, 67 by miscellaneous underground accidents, and 75 on the surface or in strip mines. It should be noted that the chief cause of fatalities is falls of coal or rock; prevention of this type of accident is largely a question of care on the part of the individual miner and, to a lesser degree, of his immediate supervisor.

General Aspects.—Successful operation of a mining enterprise requires a careful blending of many skills under experienced technical supervision and wise fiscal management; a large measure of good fortune is also necessary, as only a small percentage of mining ventures pay off the money invested in them and show a profit. A study of precious metal mining companies organized in Ontario between 1907 and 1941 indicated that less than 1 per cent were likely to pay a fair return on the investment. The proportion of successful ventures is much higher in coal mining, where the extent and value of the bed can be accurately determined at relatively low cost, a deposit can usually be purchased close to markets or to established transportation systems, and the costs of mining can be predicted with reasonable accuracy, with less chance of unexpected natural conditions causing excessive expenses.

The choice of methods offered in mining is wide in most cases. Where natural conditions are favorable the right selection may lead to outstanding success, but the wrong one can cause financial ruin or loss of life. Many fortunes have been made in mining, and the development of the industry has resulted from the willingness of men to risk everything in the hope of great financial success.

Any industrial economy must rely on a firm mining industry to supply its raw materials. Coal and iron in abundance are the primary essentials, followed closely by oil, copper, and the more common non-ferrous metals. Even a mineral for which the demand is only slight, however, is essential to modern industry, and a supply of almost every known commercial mineral must be available, within the country or by importing, to maintain the world of today. See also MINING ENGINEERING.

ERNEST M. SPOKES,
Associate Professor of Mining Engineering,
University of Kentucky.

MINING ENGINEERING, that branch of engineering which pertains to the operations of extracting useful minerals from the deposits in which they occur. While no distinct line can be drawn between the fields occupied by mining and mining engineering, the former may be termed an industrial art and the latter an applied science. The present article will be confined to a consideration of the qualifications, professional duties, and training of the mining engineer; the subjects relating to mining as an art, namely, the modes of searching or prospecting for mineral deposits, the various systems or methods of working mines, and the details of the operations, connected therewith, are dealt with under the head of MINING.

The province of the mining engineer comprises the testing and valuing of mineral deposits, the planning and execution of the various mining works required to reach the deposit—such as tunneling, shaft-sinking, etc.—the choice and application of a suitable method of opening the mine and bringing the ore to the surface, the selection of means of preparing the mineral product for sale, and, lastly, the installation of the necessary surface and underground plant. In addition, therefore, to a knowledge of the theory and practice of the various kinds and methods of mining, the successful pursuit of the profession demands not only a training in mathematics, mechanics, physics, and other fundamental subjects which underlie all engineering education, but also an intimate acquaintance with certain of the natural sciences, particularly geology, mineralogy, and chemistry, and many of the principles of civil, mechanical, and electrical engineering. In a well-planned course of professional instruction the scientific studies would preferably come first, but the engineer lacks a comprehensive understanding of his profession until to these he adds a knowledge of the actual practice of mining, ore dressing, and extractive metallurgy. The functions of the mining engineer cannot be defined in precise terms, largely because of the infinite variety of local conditions which may be encountered, and the differing physical, mineralogical, and chemical characteristics of the ore deposits themselves. (See also ORE DEPOSITS.)

There has been a great tendency toward specialization in mining. As the professional field has broadened, no one man can hope successfully to cover it all. Quite a sharp distinction exists, for example, between metal mining and coal mining. The modes of deposition of coal and of the metalliferous ores, the geological and physical conditions, and the accepted systems of mining are so different that the engineering

of collieries has become largely a specialty. So again among the metals themselves, Engineers may be led to specialize in the direction of iron, or lead and zinc, or copper, or gold and silver mining. This latter differentiation is not the result of any fundamental diversity in the methods of developing and working the mines, but is due rather to differences in the scale of operation, the physical characteristics of the deposits themselves, the treatment of the ores of the various metals, and their final disposition. It frequently happens that the dressing, or concentration, and even the smelting or other process for the reduction of the ore are carried on at or near the mine itself and under the same general management. The mining engineer, therefore, must be something of a metallurgist also, and, though not necessarily highly skilled in this direction, he should at least be able to decide upon and select the plant and process appropriate to the character of the ore, and to supervise its erection and operation. But this applies to the mining and treatment of the non-ferrous metals. The metallurgy of iron and steel forms far too large a field to be included in the range of work of the mining engineer. It requires a special training.

Several more or less conventional distinctions are made as to the particular branch of work in which a mining engineer may specialize. He may devote himself to examining, valuing, and reporting on mines, being engaged for such work by intending sellers or buyers; he may serve in the capacity of consulting engineer for one or more mining companies; or in doing a general business he may be retained by his clients in an advisory capacity similar to that occupied by a counsellor-at-law, leaving to others the actual execution of the work or the carrying out of the policy determined upon. On the other hand, a mining engineer who becomes identified with the management of the affairs of a particular company must be a successful organizer and businessman; he must possess the ability to make favorable contracts for work, the purchase of material, and disposal of product, to control men, and not only to plan work, but to know how it should be executed to attain the best economic results. He often combines with his purely professional functions the duties of superintendent or manager, and the smaller the property, the greater usually is the variety of responsibility devolving upon the engineer. When in charge of a small or temporarily non-paying mine, especially one situated in a remote region, the engineer may be compelled to serve simultaneously in the capacities of superintendent, foreman, assayer, and bookkeeper. He must know enough of chemistry and of civil, mechanical, and electrical engineering to exercise intelligent control in matters relating to these branches, and he should have at least a general knowledge of mining law.

Formerly, the profession of mining engineering was less complex and exacting in its requirements than more recently. An inspection of the course of study prescribed in mining schools of good standing will show how largely the education of a student in mining engineering lies in the direction of subjects not relating specifically to the art of mining itself. The great advances made since 1870 in scientific and technical lines have brought with them constantly increasing responsibilities. Since that date, manual labor

has been largely replaced by mechanical appliances, and the engineer must be alert in availing himself of the innovations which have been introduced in endless variety; the use of compressed air for rock drills, hoists, and other machinery, the ever-widening applications of electricity in the automatic control of machinery and for power, the various machines for loading ore and coal which have appeared, numerous continuous-type mining machines designed for coal, but with possible application to other soft minerals, the drilling of blast holes by shaped explosive charges and by jet-piercing with blow torches, the use of internal combustion engines, the numerous improvements in machines and processes for the concentration and reduction of ores, the increase in knowledge of the relations of geology to the deposition of ores; all these constitute new tools in the hands of the mining engineer, but they unite also in demanding a broader and more severe training.

Mining and hoisting large quantities of ore from great depths, that is, vertical depths of, say, more than 5,000 feet, are among the most serious problems confronting the mining engineer. Depths of as much as 7,000 feet have been already attained in several mining districts, notably in the state of Mysore in India and the Witwatersrand in South Africa, where mining is conducted more than 9,000 feet below the surface. The prosecution of work at such depths involves the solution of rather intricate problems. One of these is the support of the workings to prevent rock bursts, which are failures of the rock with explosive violence due to the tremendous pressure. A second is the providing of large quantities of conditioned air to the hot and frequently humid workings. Another is the proper design of hoisting equipment and controlling apparatus for the safe, economical, and rapid transportation of hundreds of men, large tonnages of ore, and a variety of equipment and supplies at speeds as high as 5,000 feet per minute in some cases; the difficulties involved include the varying weight of the rope itself as it winds upon its drum, a weight which often greatly exceeds that of the ore raised at each hoisting operation. A high degree of mechanical skill and knowledge is demanded for the effective solution of these and other problems. Consult discussions on hoisting from great depths which appeared during 1902 and 1903 in *Engineering and Mining Journal*, New York, and in the transactions of the Institution of Mining and Metallurgy, London, and of the South African Association of Engineers.

In all branches of his work the mining engineer of the present day finds himself compelled to introduce every new method and appliance that promises some saving in the cost of production. This is the result of many factors: wages have increased greatly, in the United States, for instance, from up to \$2 per day in 1873 to approximately \$14 in 1951; the prices of some metals have dropped greatly in that period—for example, the New York price of silver went from \$1.30 to \$.90 per ounce; the rich ores of many other metals have been exhausted to such a degree and current demands are so great that it is necessary to mine low-grade ores which, in spite of higher prices, in some cases are profitably mined only because of government subsidies. Furthermore, as the more easily accessible mineral deposits are exhausted the mining engineer is called on to practice his profession farther afield, often in regions

remote from centers of population. Here he may be confronted with new problems arising from the lack of transport facilities, distance from source of supplies and materials, labor insufficient in quantity and poor in quality, and adverse and unhealthy climatic conditions.

Engineering has progressed from dealing merely with design of machines and processes to include the development of their most efficient utilization by careful management. This is attained, firstly, by the successful application of management-labor practices to insure productive attitudes on the part of the workers and, as a result, obviate low production rates and strikes; and, secondly, by careful time-and-motion study of the relationships between men, machines, and working places to prevent loss of operating time while one group of workers or a machine and its operator are waiting for another group or machine to complete one stage of an operating cycle. Much emphasis is being placed on labor relations, and engineers, as management representatives, must take the forefront in careful handling of delicate situations and in daily maintenance of good relations. The mining engineer must frequently plan and execute his own time-and-motion studies, usually to attain lower costs, but often to assemble data justifying proposed changes in equipment, mine layout, or operating methods. This is especially true in the modern coal mine, where expensive machines for undercutting, drilling, and loading and hauling away the broken coal after blasting must move from one working place to another with a minimum of mutual interference.

Mining is an essentially hazardous occupation. The mining engineer is charged with elimination or mitigation of the hazards by the judicious use of safety policies covering worker selection and education, safety devices, rules, competition, awards and punishments, accident investigations, and inspection for and correction of hazardous conditions. It has been observed that the safety record of a mining operation is a direct reflection of the attitude of the management toward safety, and an engineer without a forthright and positive interest in the elimination of accidents can expect to have a poor record.

That function of the mining engineer which relates to examining and reporting on mining properties is both delicate and difficult, and calls for the highest degree of professional efficiency and integrity. In brief, the examination of a mine includes a study of the local conditions, topographical, geological, and economic, and of the mineral deposit itself; the mineralogical character, quality, quantity, and grade of the ore, and its value per ton; an estimate of the cost per ton of mining the ore and the net profit which reasonably may be expected; and, lastly, the probable life of the mine. Upon these factors depends the market value of the property. In determining the quantity and grade of the ore, the deposit, as revealed by the development work already done, must be carefully and systematically tested. This is done by taking a series of samples in a manner which will enable the engineer to obtain a true average of such ore as can be examined and measured with sufficient accuracy and definiteness to warrant confidence in the results obtained. Besides the ore which can be actually measured and sampled, the engineer may often be warranted in taking into consideration the quantity of ore which in the future will probably

be rendered available by further development of the mine. In balancing such probabilities or possibilities, he must be guided mainly by geological and mineralogical analogies deduced from his previously acquired knowledge and experience. It may be added that the circumstances under which mine examinations are made are often rendered difficult and embarrassing where the perpetration of fraudulent practices by interested persons may be attempted for the purpose of misrepresenting or concealing the true condition of the mine; records of cost and of the value and amount of previous production may be falsified, or the samples taken by the engineer tampered with. Constant vigilance is required to guard against such contingencies.

With the development of the mining industry and the wider adoption of mechanical appliances and engineering methods in connection with mining operations, the demand for trained engineers has steadily increased to such a degree that probably no field of engineering affords better opportunities for a young man. Formerly, the so-called "practical" man monopolized most of the positions of responsibility and emolument, but the educated engineer has made his way to a degree that has produced an active demand for his services. Mining companies have found that the greater breadth of view resulting from a sound technical education has a direct money value. The trained engineer is acquainted with what is being done in his profession in other regions or countries. He keeps himself informed as to the experiments and discoveries made by others, is quick to utilize improved and more economical methods, and knows not only what to do, but also what to avoid. His competitor who lacks this knowledge, having at his command only what has come within his own personal experience, is in danger of failure if circumstances bring him face to face with new conditions and with problems the prompt and efficient solution of which must be based on a familiarity with the principles of engineering practice. It must be remembered that the young graduate of a mining school is not yet an engineer; he has been grounded in the fundamentals of his profession, has absorbed a multitude of facts relating to its practice, and his powers of observation have been cultivated; but before he is fitted to deal successfully with the diverse problems which sooner or later will confront him, he must in most cases patiently continue his education in the field for some years after graduation. His first employment is likely to be that of miner's helper, chemist, assayer, draftsman, surveyor, or assistant to one of the heads of department in the mine or works. How fast he advances will depend on his native energy and ability and the efficiency of his preparatory training. Not all young men are fitted by nature to become successful mining engineers. If the student has no aptitude for such a pursuit, the sooner he finds it out, the better both for himself and his instructors. The curriculum of the school, therefore, should be so planned as to eliminate inefficient students as early in the course as possible.

In the making of an engineer, circumstances and opportunity are important. A well-known engineer and instructor has said: "A man without school education may make a remarkable engineer; but it may have taken him years to get his training and at the end of the time there may be whole regions of knowledge utterly unknown

to him; in other words, he is liable to be a one-sided man without a broad outlook upon other fields than his own. The school cannot teach him everything, but it can give him the keys to the storehouses which he may need to draw from in after life." A graduate of a good mining school has this advantage over his uneducated competitor: that he is better able to avail himself of the opportunities presented to him.

MINING SCHOOLS: UNITED STATES AND CANADA

The need of technical schools especially equipped for preparing young men for the profession of mining engineering was long ago recognized in Europe, and some of the institutions here established have exerted through their graduates a marked and beneficial influence upon the mining industry of the world. Previous to 1865, mining practice in the United States was based chiefly upon European methods, and the earliest work prosecuted on a large scale in this country—for example, at the Comstock mines, Nevada—was in great measure planned and managed by American engineers who had received their education in Europe. The influence of the Continental institutions also made itself felt in the organization of the older American mining schools. The first School of Mines in the United States was founded in 1863 under the auspices of Columbia College, New York. Since then, mining schools have been established in many parts of the country, the total number being now (1952) about 33. The majority of them, however, are small, with limited equipments and teaching forces. The leading mining schools of the United States are the School of Mines of Columbia University, the College of Mining of the University of California, the State School of Mines of Colorado, the Michigan College of Mines, the School of Mines of the University of Minnesota, and the schools at Rolla, Missouri, Lehigh University, and Lafayette College. The courses of study leading to the degree of mining engineer generally occupy four years but exhibit quite wide variations in plan and scope. Some of the best of the schools have rigidly prescribed courses; others offer a range of elective subjects, comprised in more or less interdependent groups. Specialization has also appeared in subdividing the mining curricula of the various schools. Metallurgical engineering curricula have taken over the field of extractive metallurgy, and mineral preparation engineering is beginning to be heard of as a field of specialization which may eventually remove this type of work from the normal scope of operations of both mining and metallurgical engineers, as petroleum engineering has taken the production of oil and gas from the mining engineer. Prospecting and exploration are fast becoming the province of mining geologists and geophysicists, to the gradual exclusion of the mining engineer. The basic field of mining engineering is sometimes subdivided into coal mining and metal mining options, and in some schools the instruction is given in only one or the other of these fields. The trend to specialization is currently being ardently opposed by many prominent men of broad experience in the field of mining engineering and engineering education, who contend that to specialize in a four-year course gives the student too narrow a basis in fundamental science and reduces the quality of his education from college or university level to

that of a trade school. They contend that specialization should be reserved for the fifth year, in work for the master's degree.

Without attempting a comparison of the curricula of these schools, a condensed statement of the ground that should be covered by a well organized School of Mines may here be given, with the total semester-credit-hours of work to be taken in each department indicated:

Mathematics (15): college algebra, solid trigonometry, analytical geometry, calculus
Chemistry (16): general inorganic, qualitative and quantitative analysis, fuels analysis, wet and fire assaying
Physics (12): general engineering physics, thermodynamics
Geology (16): engineering and economic geology; descriptive, determinative, and optical mineralogy, petrology
Engineering fundamentals (12): engineering drawing, descriptive geometry, applied mechanics
Mining engineering (32): mine surveying, fundamental mining operations, mining systems, mining equipment, mine plant design, ventilation, drainage, mining administration, mineral valuations, mine safety, mineral beneficiation
Inspection trips (3 weeks minimum): mines, preparation plants, smelters
Surveying field work (6 weeks minimum): precise control, topographical, and underground surveys
Metallurgical engineering (6): characteristics and applications of metals, principles of extractive metallurgy
Civil engineering (10): general and railroad surveying, hydraulics, structural design
Electrical engineering (6): electrical machinery, mine power control and distribution
Mechanical engineering (3): machine design
Military science (8): basic training
English (9): grammar, composition, public speaking, report writing
Economics (6): principles, business management
Other humanities (9): a coordinated program in one field such as history, government, economic geography, industrial relations.

The above program provides for eight semesters in residence and two summer courses. An additional three weeks or more could well be spent on geological work in the field. The training in humanities should be directed toward a better understanding of the political, social, and economic problems of foreign nations which supply the United States with substantial amounts of strategic materials, as increasing numbers of technically trained men are going into the government services for foreign work in mineral economics.

Requirements for admission to the best American mining schools include two years of algebra, plane and solid geometry, plane trigonometry, elementary chemistry and physics, up to four years each of high school English and history or government, and two years of a modern foreign language in some cases.

The extensive mining industry of Canada has led to the establishment of mining engineering curricula in a number of colleges and universities, including Nova Scotia Technical College, Laval University, McGill University, the University of Toronto, and the University of Alberta. While Canadian schools usually confer the degree after a four year course as do American schools, their curricula generally differ from their American counterparts in relying more on the pre-college training in mathematics and physics, and in placing more stress on philosophical considerations and on the benefits of practical experience with critical observation and reporting while at work.

Another distinguishing feature of Canadian mining schools is the planned transfer of students who have diplomas in engineering from certain colleges into a shortened curriculum at the university granting the bachelor's degree. These differences are indicative of British and Continental influences on Canadian educational philosophy as compared with American theories.

ROBERT PEELE,

Late Professor of Mining, Columbia University
Revised by

ERNEST M. SPOKES,

Associate Professor of Mining Engineering, University of Kentucky.

MINING LAWS OF THE UNITED STATES. These laws safeguard the rights of prospectors while searching for mines and, after minerals have been discovered, assure them of title, provided that all legal requirements have been complied with. No more than a brief summary of salient aspects of these laws can be given for general information. Mining statutes change from time to time as exigencies demand; therefore specific mining problems call for special consideration by qualified authorities familiar with local conditions. Failure to follow prescribed procedures incurs the danger of loss or forfeiture of rights to the property.

Sources of Mining Laws.—The influence of French and Spanish laws upon American mining jurisprudence is marked because most of the domain in the states and territories subject to federal mining laws was originally acquired by treaty or purchase from France and Mexico both of which countries had had their own codes of mining law in operation. In the old ante-revolution British grants of property are found traces of the principles of the common law whereby, in general, minerals were the landlord's property and went with the surface. The principles of common law in the United States establish for the owner of the surface *prima facie* title to minerals beneath it, until evidence to the contrary has been adduced. Separate and distinct title to minerals may, however, arise through acts of Congress or of any state, or through transfer by the individual who once owned both surface and minerals.

In regard to colonial grants, there was generally reserved to the sovereign a certain fixed proportion of the gold and silver discovered. Interesting evidence of the antiquity of these rights is found in the charter granted to Sir Walter Raleigh (1584) by Elizabeth, queen of England, which embodied this proviso: "Reserving always to us, our heirs and successors, for all services, duties, and demands, the fifth part of all the ore of gold and silver that may be from time to time and at all times after such discovery, subduing, and possessing, be there gotten and obtained." With few exceptions reservations of this nature occur in all subsequent grants. These precedents were followed by the United States in its

first dealing with public lands. Prior to 1845 the general policy of the United States was to reserve mineral lands from sale absolutely. As far as was known, these lands in the then-called Northwest or Indian territory contained lead, iron, copper, and zinc. This area is now embraced by Michigan, Wisconsin, Illinois, Iowa, Missouri, and Minnesota.

Federal Leasing System.—The legislative policy for the leasing of mineral lands in the United States originated with the law passed by Congress March 3, 1807, which provided "that the several lead mines in the Indiana territory . . . shall be reserved for the future disposal of the United States; and any grant which may hereafter be made for a tract of land containing a lead mine which had been discovered previous to the purchase of such tract from the United States shall be considered fraudulent and null, and the President of the United States shall be and is hereby authorized to lease any lead mine which has been or may hereafter be discovered in the Indiana territory for a term not exceeding five years." Under the supervision of the War Department leases, first of three miles, and later of one mile square, were given which bound the lessees to diligently work the mines and return to the United States six per cent of all ores raised. This system worked well for a time, but after 1834, for good reason, miners and smelters refused to make further payments, and the government was unable to collect them. So much trouble was involved that in 1847 it was decided to end that system and sell mineral land outright without reserves of lead or other metal. The act of 1847 laid the foundation of a more substantial prosperity.

Mexican Grants.—The peace treaty with Mexico, proclaimed July 4, 1848, added to the national domain more than 500,000 square miles including California, Nevada, Utah, Arizona (except Gadsden Purchase of 1853) New Mexico, west of the Rio Grande, and north of Gadsden Purchase, Colorado, west of the Rocky Mountains, and southwest part of Wyoming. The Gadsden Purchase (q.v.) added 45,532 square miles to the public domain forming part of the present states of Arizona, and New Mexico. Under the treaty, all property theretofore belonging to Mexico within defined limits, passed to the United States which government undertook to protect valid rights acquired under Mexican rule.

In California, a board of land commissioners was appointed to whom all persons claiming lands by virtue of any right granted by the Spanish or Mexican government were required to present their claims. Such claimants had the right to appeal to federal courts. By the acts of July 22, 1854; Feb. 28, 1861; and Feb. 24, 1863, the surveyors-general of New Mexico, Colorado, and Arizona, were required to report to the Department of the Interior upon all private land claims within their jurisdictions. All rights and claims to lands arising out of Mexican grants presumably have been finally settled by judiciary decree.

Source of the Public Domain.—The national government acquired no property rights within the present boundaries of the 13 original states, nor in the States of Vermont, Kentucky, Maine, and West Virginia, hence no question of apex rights or other questions of federal procedure or titles arise therein. The first acquisition of national domain which became subject to disposal of Congress was by cessions of territory claimed

by seven of the original states. These cessions, over a period of 20 years (1781 to 1802) brought all that territory now comprising Tennessee, Illinois, Indiana, Ohio, Michigan, Wisconsin, and parts of Alabama, Mississippi, and Minnesota within the jurisdiction of the federal government.

In 1803 was added to the national domain the territory known as the Louisiana Purchase, and in 1867, the territory of Alaska. In 1898 all lands in the Hawaiian Islands, covered by the treaty of cession, which belonged to the republic as distinguished from private lands, also became subject to the disposal of Congress the same as the other public lands although the land laws of the Hawaiian republic existing at the time of the treaty continued in force. These laws do not provide for sale, or other disposition of lands classified as mineral. In Puerto Rico, ceded to the United States by Spain, its lands are subject to disposal under territorial laws of that island. Thus it is indicated that federal statutes regarding public domain do not apply to all territory controlled by the United States.

Principles of Construction of Mining Laws.

—Two fundamental principles form the basis of all mining laws: (1) the right of mine operators to secure an indefeasible title to their property provided that specified conditions are complied with; (2) the right of the state or other landlord to certain rents, royalties, or taxes on the profits of mining property, and to reasonable performance of effective work so that invested capital shall not be idle. These principles are essentially common to the laws of all countries although in individual cases subject to modification to suit local conditions.

Classes of Mining Laws.—There are two classes of mining laws: (1) the "concession" system whereby the state or private owner of mining property may grant leases or concessions to others under stipulated restrictions; (2) the "claim" system. This originated when adventurers rushed in and staked out claims in newly discovered gold producing areas. At the beginning of this wild rush there was locally no law to restrain, and no court to punish an offender for trespass, misdemeanor, larceny, or murder. The miner whose rights were invaded or whose property was taken, had neither court nor authority to which he could resort for the protection of his rights, or redress his wrongs. The tide of immigration carried on its crest men of learning and integrity; but it also swept before it the derelicts of society—criminals fleeing from punishment past or prospective. For self-protection the law-abiding prospectors organized themselves into local communities acting with the direction and authority of constituted bodies exercising power to preserve and to punish offenders. The communities were known as Mining Districts. The "claim" system was, therefore, necessary to determine at once the conditions under which the miner was permitted to work and hold the property. And it is necessary by law to ensure proper working of the claims. These two classes of mining laws are basic.

Theory of United States Mining Laws.—Mining in the United States is not a "public utility"; it is a private industry such as other economic industries. The government does not concern itself with mining lands, nor with mining, after it parts with title. No royalties are reserved, and no governmental supervision is attempted. Upon issuance of the deed of the

government, mining land becomes private property subject to the same laws as other real property. The government of the United States has never engaged in mining operations although to do so is within its sovereign power. Nor is there any provision in United States laws for the location of mining claims in privately owned lands; public mineral lands only may be located and entered under the mining laws.

By act of Congress March 3, 1849, the Department of the Interior was given authority to administer public lands. Prior to 1866, it was the policy of the United States government to reserve the minerals in all lands sold or granted to individuals, states, or railways and other corporations. Except in special cases, it was the uniform policy of the government to reserve mineral lands from sale or grant in all cases. With regard to railroad grants non-mineral lands only were to be granted; but discovery of mineral character after title has legally passed does not invalidate title, because issuance of patent to the land implies that it has been examined by the land department and found to be non-mineral in character, and establishes vested rights which can not be attacked. See also article PUBLIC LANDS.

First General Mining Act.—The first general statute by which title could be acquired to any public mineral lands within what are known as the mining states and territories was the law of July 26, 1866. Although this act has since been largely superseded or repealed by subsequent legislation it is said to have established three beneficent principles: "(1) that all mineral lands of the public domain should be free and open to exploration and occupation; (2) that rights acquired in these lands under local rules, with the apparent acquiescence of the government, should be recognized and confirmed; (3) that titles to at least certain classes of mineral deposits or lands containing them might be ultimately obtained."

Mining Act of 1872.—The famous "Apex Law," which is "an act to promote the development of the mining resources of the United States." It was passed by Congress May 10, 1872. In accordance with its provisions the vast majority of mining claims in the territory to which it applies have been located. With a few additions and amendments, it is the law under which federal mining rights are now acquired. This law is now incorporated in the *United States Code Annotated*, Title XXX, chapter 2, generally available in any public law library. Following is a brief digest:

Reservation of Mineral Lands from Sale.

—Unless otherwise expressly directed by law all lands valuable for minerals shall be reserved from sale.

Valuable Mineral Deposits Open to Location.

—All valuable mineral deposits in surveyed and unsurveyed United States lands shall be open to exploration and purchase under stipulated conditions.

Length and Width of Lode Claim.—Discovery is essential to location. The act provides explicit detailed directions whereby mining claims shall be governed as to length by the customs, regulations, and laws in force at the date of their location; and limitations of footage along the vein or lode and extent on each side, etc. No location may be made until the discovery of the vein or lode within the limits of the claim is lo-

cated; end lines of each claim must be paralled to each other.

Proof of Citizenship, or an affidavit in regard thereto, is required of all claimants.

Extralateral and Intralimital Rights.—Regulations governing exclusive right of possession of all the surface included within the end lines of locations and of all veins, lodes and ledges, throughout their depth, the apex of which lies inside surface lines extended downward vertically, although they may depart from the perpendicular so as to extend outside the vertical side lines of surface locations, subject to definite restrictions and regulations.

Tunnel Rights—Length of Tunnels.—Rights of possession of all veins or lodes within prescribed limits from the face of tunnels and stipulations in regard thereto, and conditions governing validity of claims by others.

Mining-district Regulations by Miners.—The right of miners to make regulations subject to restrictive conditions regarding annual labor on claims pending issue of patents, and requirements of minimum labor expenditures, etc., and expenditures on tunnels.

Patent Proceedings.—The procedure for obtaining a patent for any land claimed and located for valuable deposits entails observance of many detailed requirements such as the filing of a plat and field notes clearly indicating all boundaries of the claims, and the filing of affidavits; the publicizing of the same for a stated period; evidence of the expenditure of a minimum sum for labor, etc. If no adverse claim is filed and all requirements have been complied with it may be assumed that the applicant is entitled to a patent upon payment of five dollars an acre, and that no adverse claim exists.

Adverse Claims, Filing of, and Suit upon.—Adverse claimants are required to file under oath full details of the nature of claims; and all proceedings regarding the issuance of patents related thereto are stayed until the controversy has been settled by a court of competent jurisdiction. Adverse claimants must commence proceedings within a given period; failure to do so constitutes a waiver of claim. After the rendering of the judgment formal procedures under the act must be observed.

Claims on Surveyed and Unsurveyed Lands.—Vein or lode claims upon surveyed lands must designate location with reference to the lines of the public survey; but claims upon unsurveyed lands require adjustments according to statutory regulations by the United States supervisor of surveys.

Placer Locations, Claims, and Patents in Regard Thereto.—Requirements covering all details as to forms of deposit, subdivisions of claims, group entries, patents for lodes within placers, adverse claims and possession, which call for detailed consideration, are fully stipulated in the Code.

Further statutory requirements regarding mineral surveyors, expenses and fees, affidavits, crossloads and uniting veins, patents for millsites, homesteads upon mineral lands, exceptions in various states, water rights, etc., are fully provided in chapter 2, Title XXX, of the *United States Code Annotated*.

NOTE.—The foregoing curtailed digest is merely indicative of the extent and nature of the *Code Annotated* which should be studied in detail before effective application to any mining problem or question.

Mining Laws Extended to Non-Mineral Lands.—Reference to the following chapters and sections of the *United States Code*, Title XXX, having no bearing on the Apex Law, but applying to federal mineral lands, may be of interest. Chapter 3 of Title XXX refers to "Land Containing Coal, Phosphates, Petroleum, Oil, Oil Shale, Gas, Sodium, Potassium, etc., and Building Stone." Sub-titles of chapter 3 are given hereunder:

Entry on coal lands in general, sections 71-77.

Entry under Non-mineral Land Laws of coal lands, with reservation of coal to United States, sections 81-90.

Entry under Mining Laws of lands containing petroleum, or other mineral oils or gas, sections 101-104.

Homestead entry of lands in Utah withdrawn or classified as oil lands, sections 111-113.

Agricultural entry of lands withdrawn or classified as containing phosphate, nitrate, potash, oil, gas or asphaltic minerals, sections 121-123.

Locations under Placer Mining Laws of lands containing phosphate rock, section 131.

Permits to prospect for chlorides, sulphates, carbonates, borates, silicates or nitrates of potassium, sections 141-152.

Entry of building stone or saline lands under Placer Mining Laws, sections 161-162.

Disposal of lands in Alabama as agricultural lands, sections 171-172.

Leases and prospecting permits, subdivision 1, general provisions; sections 181-194, subdivision 2, coal; sections 201-208, subdivision 3, phosphates; sections 211-214, subdivision 4, oil and gas; sections 221-236, subdivision 5, oil shale; section 241, subdivision 6, Alaska oil proviso; section 251, subdivision 7, sodium.

NOTE.—All references in chapter 3 apply only to United States lands and the entry upon the same.

The Bureau of Mines.—In chapter 1, of Title XXX of the *United States Code Annotated*, subtitle "The Bureau of Mines," sections 1-11, are governmental rules and regulations concerning the Bureau of Mines, establishment, director, experts and other employees.

Withdrawals of Public Lands.—The president may, at any time in his discretion, temporarily withdraw from settlement, location, sale or entry, any of the public lands of the United States, including Alaska, and reserve the same for water-power sites, irrigation, classification of lands, or other public purposes to be specified . . . all lands withdrawn under provision of the act shall at all times be open to exploration, discovery, occupation and purchase under the mining laws "so far as the same apply to metalliferous minerals."

Regulations of the Land Department.—Supervision of mineral lands was transferred to the General Land Office of the Department of the Interior when it was established March 3, 1849. This department has judicial powers to hear and determine claims to public lands. There are two classes of claims: lode claims and placer claims.

Lode Claims—Dimensions.—Lode claims may have a maximum length of 1,500 feet, a maximum width of 600 feet, not exceeding 300 feet on each side of the vein at the surface. The law of 1872 governs exterior boundaries of claims and other conditions regarding lode claims such as initiation of title, location notice, perpetuation of possessory title, method of procuring patent, etc.

Placer Claims.—Discovery of valuable mineral in place is necessary before location of a placer claim. The price fixed by law for placer claims is \$2.50 per acre. Proceedings to obtain patents for placer claims are similar to those for obtaining patents for vein or lode claims except where a placer claim is upon surveyed lands, and conforms to legal subdivisions when

no further survey or plat will be necessary. The law provides explicit directions regarding the making and filing of placer applications.

Mining Laws of Western Mining States and Alaska.—The states of Arizona, Colorado, California, Idaho, Montana, Nevada, New Mexico, North Dakota, Oregon, South Dakota, Utah, Washington, Wyoming, and Alaska have all adopted laws for the working of mines under authority of Section 43 of the *United States Code Annotated*. There are constant changes in these statutes; specific data on the mining laws governing these states call for special research. For a general survey of the nature of the special mining laws of the states mentioned a comprehensive view may be obtained through study of the California acts, as now contained in the *California Civil Code* of 1937, and amended through the 52d Session of the California legislature of 1937. Inasmuch as California is a typical mining state, a brief capitulation of the California Mining Act follows. Subsequent reference to the mining laws of other states is by title only.

Lode Claims, How Located.—Any qualified discoverer of a vein, or lode of quartz, or other rock in place, bearing gold, silver, cinnabar, lead, tin, copper, or other valuable deposit, may locate a claim upon such vein or lode by defining the boundaries of the claim; and by posting a notice at the point of discovery containing the names of the lode or claim and the locator; the number of linear feet claimed in length and width, the date of location; and a description by reference to some natural object as will identify the claim located.

Boundaries and Extent of Lode Claims.—In no case may the claim extend more than 1,500 feet along the course of the vein or lode, nor more than 300 feet on either side. Within 60 days after the location of the claim the locator must erect post markers as prescribed.

Record of Location.—A true copy of the notice of location must be given the recorder of the county in which the claim is situated.

Placer Claim, Location of.—The procedure is similar to that stipulated in regard to lode claims provided, that where the United States survey has been extended over the land embraced in the location, the claim may be taken by legal subdivisions, and no other reference than those of the survey is required, and the boundaries need not be staked or monumented.

Discovery Shaft.—Within 90 days after date of the location the locator shall sink a discovery shaft to a minimum depth of 10 feet exposing the deposit upon which the discovery and location is based, or drive a tunnel, adit, or open cut at the discovery point to at least 10 feet below the surface, exposing the deposit.

Placer Locations, Work on.—On all locations containing more than 20 acres, the locator shall within 90 days after date of location perform at least one dollar's worth of work for each acre in the claim.

Relocation of Lodes or Placers.—The same procedure as with an original location is required, except that the relocater may either sink a new shaft as required by law to expose the deposit upon which the location is based, or drive a new tunnel, adit, or open cut to at least 10 feet below the surface, or the relocater may sink the original shaft 10 feet deeper, or drive the original tunnel, adit, or open cut 10 feet farther.

Tunnel Right, Location of.—Locator of a

tunnel right or location is required to post a notice at the face or point of commencement of the tunnel, which must contain the name of the locator; date of location; proposed direction of tunnel; description with reference to some natural object as will identify the claim or tunnel right.

Boundaries of Tunnel Location.—Boundary lines of the tunnel by stakes or monuments are required from the point of commencement of the tunnel to the terminus.

Record of Tunnel Location.—A true copy of the notice of location must be given the recorder of the county in which the claim is situated within 30 days after posting notice.

Amended Notice of Location.—Subject to stipulated conditions the locator may file an additional notice should his original location have been defective, erroneous, or in non-compliance with the law.

Prima Facie Evidence of Record of Survey.—Under stipulated conditions a certificate of the surveyor setting forth that the survey was made by him; the name of the claim and the location thereof; and that the description incorporated in the declaratory statement is sufficient to identify; such survey and certificate become a part of the record, and are *prima facie* evidence of the facts therein contained.

Millsite, Location Thereof.—Persons qualified by law may locate not more than five acres of non-mineral land as a millsite.

Record of Location of Millsite.—The locator of a millsite, claim, or location is required within 30 days to record a true copy of his location notice with the county recorder.

Annual Labor Required.—To hold possession of a mining claim the amount of work done or improvements made must be of a value not less than \$100 annually.

Record of Proof of Annual Labor.—An affidavit setting forth the value of labor or improvements made, and other formal requirements, must be recorded and duly certified by the county recorder. Such affidavit shall be *prima facie* evidence of the performance of such labor.

Forfeiture to Co-owners; Contribution by Delinquent Co-owners.—Complete details of the requirements of law in regard thereto are given in Section 1 426o of the *California Civil Code*, together with penalties for noncompliance therewith.

Records to Be Received in Evidence.—The record of any location of a mining claim, millsite, or tunnel right, in the office of the county recorder shall be received in evidence, and have the same force and effect in the courts of the state as the original notice.

Copies of Record as Evidence.—Copies of the records of all instruments recorded and certified by the recorder may be read in evidence under circumstances and rules as provided by law.

Effect of Act on Mining Districts.—The provisions of the act shall not be construed as affecting or abolishing any mining district or the rules thereof within the State of California.

Failure to comply with the requirements of Sections 1 426, 1 426a, 1 426da, 1 426db, or 1 426dc of the *Code* shall render locations null and void, and no portion of the area within such location shall be subject to relocation by the same locator for a period of three years from the date of such voidance.

Failure to perform development work of the character required by law disqualifies locators

from relocating the ground in the original location or claim for a period of three years.

The foregoing curtailed capitulation of the leading features of the *California Civil Code*, 1937, derives from one of the more recent expressions of state legislation on the subject of the location of mine claims, upon the public domain, within the particular states. Further details regarding California mining laws are contained in the laws of that state of 1927, 1929, 1931, 1933, and 1935. Other laws have been and will be passed from time to time but the foregoing covers the most important of the California mining acts. Special provisions for the location and sale or lease of state mineral lands have also been passed by California, Michigan, Minnesota, Nevada, Texas, New York, Wisconsin, and some other states.

Exceptions to statutory requirements of federal mining laws are stipulated in the statutes and codes of Arizona (1928); Colorado (1933); Idaho (1932); Montana (1935); Nevada (1929); New Mexico (1929); North Dakota (1913); Oregon (1930); South Dakota (1929); Utah (1933); Washington (1932); Wyoming (1931); Alaska (1933).

CURTAILED SUMMARY OF UNITED STATES LAWS

How Mining Rights May be Acquired.—

The conditions of the right of possession are: (1) *discovery*, (2) *development*. In all of the mining states, except California and Utah, a certain amount of development work is essential to the completion of the location. In addition to this preliminary work, \$100-worth annually of labor and improvement is required by national law as a condition to perpetuation of possessory title. The nature of the work required to be done varies in different states. Further essential requirements as to "posting of notice," "marketing of location," and "recording of notice" of location, in each case are governed by local or state regulations.

How Mining Rights May be Lost.—Forfeiture of a mining claim may be caused by failure to fulfill any of the acts required by the laws for maintenance of possession. Abandonment also results in loss of mining rights although under certain conditions resumption of work in good faith before initiation of possessory rights by others operates to prevent forfeiture.

Patent Proceedings.—Patent is the deed or grant of the United States conveying the title authorized to be given by the mining or other land laws. It establishes the character of the land which it conveys, and is conclusive evidence of performance of all necessary steps leading to its issuance. Exclusive jurisdiction over the disposition of lands of the public domain under the law lies with the Land Department under the supervision of the Department of the Interior. To obtain a patent for mining land from the United States it is first necessary to make application to the district surveyor general for a survey. Stipulated requirements must be complied with regarding names of claimants, locations; names of the mining district, state and county in which claims are located; and the name of the surveyor to whom the order is to be issued.

Where placer claims are upon surveyed lands, and conform to legal subdivisions, no further survey or plat is required. If a known lode exists within the placer it must be described in

the survey and surveyed as though it were situated elsewhere.

Adverse Claim.—Adverse claims are permissible where one mineral claimant contests the right of another mineral claimant. Controversies over the character of the land, that is, whether mineral or agricultural, etc., are not proper subjects for adverse claims; but may be heard by the land department under the head of protests.

Nature of Title Conveyed by Mineral Lode

Patents.—Patent to a lode claim conveys: (1) exclusive right of possession of all the surface included within the limits of the location, subject only to pre-existing easements; (2) all veins, lodes, and ledges throughout their entire depth, the tops, or apices, of which lie within the boundaries, the right to pursue the vein in depth outside such boundaries being limited however . . . ; (3) *prima facie*, such a patent confers the right to everything found within vertical planes drawn through the surface boundaries; but these boundaries may be invaded by an outside lode locator under statutory restrictions.

Placer patent conveys to the patentee everything within vertical planes with exceptions as prescribed by law. This term in current legal phraseology implies the right to follow the vein beneath the surface of land owned by another. There is considerable differentiation in the interpretation of this which has given rise to interminable litigation. (Refer to Chapter 2, Title *United States Code*.)

FIG. 1. Ideal location.

Ideal Claim Defined.—An ideal quartz mining claim is a portion of mineral land, 1,500 feet or less in length, along the vein, and 600 feet or less in width. Fig. 1 illustrates the surface of such a claim, showing the apex and course of the vein, and the side and end lines of the claim. Fig. 2 illustrates a cross-section of such claim showing the vertical side lines thereof, and the dip of the vein. The statute seems to refer only to an ideal location, with the vein on its course or strike passing through its two parallel end lines. The planes of the end lines, dropped downward perpendicularly, and extended in their own direction until they intersect the exterior portions of the vein, bound the extralateral rights on such vein. In actual mining, however, an ideal location is the exception rather than the rule because of the inability of the locator to determine the actual course or strike of the vein at the time of completing his location. It is almost impossible to determine correctly the true course or strike of a vein from such a small exposure. Veins may be found running through the earth in almost every direction.

Principles of Extralateral Rights.—In applying this statute, certain well-established principles must be borne in mind.

1. The basis of extralateral rights is the existence of the apex of vein within surface

FIG. 2. Cross-section, ideal claim, showing dip.

boundaries of the location, dropped downward perpendicularly, and therefore their extent along the vein should always be limited by the extent of the apex within the claim.

2. In order that extralateral rights exist in any location, its end lines must be parallel. It is not held that the end lines must be parallel in order that such location be valid, but only that they must be parallel in order to give extralateral rights to any vein the apex of which may lie within the surface boundaries of such location. A prospector has the general right to make his location in such shape as he desires, and it will be held valid if he has otherwise complied with the law. End line parallelism need not be mathematically accurate; substantial parallelism is all that is necessary.

Extralateral Rights on Incidental or Secondary Veins.—Statute gives extralateral rights to all veins whose tops or apices lie within the surface lines of the location. The vein on which the location is based is called the "discovery," or "original" vein; others are called "secondary" or "incidental" veins. While all veins have equal and similar rights under the law, yet the location or discovery vein, in its relation to the surface boundaries, is the vein which determines the direction of the planes limiting the extralateral rights for all other veins apexing within the claim. Consult decisions of federal and state courts.

Conflicting Extralateral Rights.—If two claims may be so located on the same vein that the planes of their extralateral rights will intersect, the senior valid location is entitled to those portions of the vein which are in conflict. The junior rights again attach beyond the area of the conflict.

Veins Dipping Into and Beneath Agricul-

tural Patents.—Whether veins properly located under the mining laws can be followed down beneath the surface of patented agricultural lands seems not to have been decided by the United States Supreme Court. Refer to decision of Ninth District Circuit Court (36 Fed. 668).

Conclusion.—The statute of 1872 is generally considered to be ambiguous and perplexing. Questions arise which have to be carried to the Supreme Court of the United States for final decision. For further details refer to "Why the Mining Laws of the United States Should be Revised," by H. V. Winchell, in *Transactions, American Institute of Mining Engineering*, vol. 48, p. 361.

NOTE.—The foregoing general outline of the mining laws of the United States is taken, by courtesy of the publishers, from "Mining Engineers' Handbook," 2 volumes, 3d edition, edited by Robert Peck; publishers, John Wiley and Sons, Inc., New York.

MINING MACHINERY AND MILLING MACHINERY. Mining is the process of extracting valuable minerals from the crust of the earth and placing them on the surface where they may be used. The deposits in which the minerals are contained are known as ore bodies if they can be extracted from the ground at a profit. For the purpose of mining, ore bodies fall into two major classifications: surface and underground.

Surface Mining.—Surface deposits may lie exposed on the surface or be buried under several hundred feet of overburden. The overburden is worthless material and must be removed before mining can begin. A big factor in determining whether an ore body shall be mined by open-pit methods or underground is the depth of overburden. The process of uncovering the ore body is called stripping. If the ore body is a thick one, the mining and stripping are carried on simultaneously once the first ore has been disclosed, and the excavation is made in successive lifts of from 20 to 50 feet so that the walls of the pit rise in terraces. The same machines are used for excavating in both the stripping and mining operations.

Shovels are used for digging the overburden without drilling and blasting when the material to be excavated is unconsolidated. Conventional types of steam or electric shovels with 4- to 12-cubic yard buckets are used. These machines are all crawler mounted and therefore highly maneuverable. When large volumes of material must be handled in stripping operations, equipment with greater capacity is needed. The dragline is often used for this work. It is a long-boom shovel, self-propelled and fully revolving. The bucket is like a scoop and is manipulated by wire cable which permits it to be dropped from the end of the boom and pulled back toward the cab, scooping up earth as it comes. When the bucket is full, the machine turns to dump the waste out of the way or into trucks or a loading tippie. It is essential that the stripping operation be performed as cheaply as possible, because the lower the cost of stripping the deeper the overburden can be and still permit economical mining of the ore body by surface methods.

Trucks are used to a great extent for hauling ore and waste out of the pit. These trucks are all of extra-heavy construction and normally have capacities up to 30 tons. They are powered by gasoline and Diesel engines.

Locomotives are used for transporting rock

in large open-pit mines. The truck is particularly adapted to medium and small pits where steeper haulage grades are used. However, in very large open-pit mines, some type of rail haulage is more economical. Steam, Diesel, or electric locomotives are used. The ore or waste is loaded by shovels directly into the railroad ore cars for transportation out of the pit.

Belt conveyors have a limited use in open-pit mining or stripping, but there are a few such installations and they are ubiquitous to material handling operations. They consist of an endless belt made of rubber with a cord or steel wire core. At the extremities of the belt are drums or drive pulleys which transmit the motion of the propulsion motor to the belt. Spaced a few feet apart along the entire travel of the belt are rollers which are called idlers to carry the weight of the burdened belt.

Rock drills are used to drill holes in the rock in which dynamite is placed for blasting when the rock is too hard to be excavated by a shovel without first being broken up. The *churn drill* is the most common type of drill used for this work. It drills holes from 6 to 12 inches in diameter to depths of 50 feet if necessary. The drill bit is made of steel with chisel faces on its cutting end. The machine operates by dropping the bit to the bottom of the hole being drilled, and the impact pulverizes the rock. This operation is repeated over and over again until the hole is drilled. The bit is weighted by cylinders of steel, and the bit and weights, known as the "string of tools," may weigh between 2,000 and 3,000 pounds. The tools are attached to a wire cable which passes over a head sheave on the top of a vertical tower and comes down to wrap around a hoisting drum. The drum winds up the cable, pulling up the string of tools to the top of the tower and, as the clutch is released on the drum, the tools drop to the bottom of the hole. Water is used in the drilling operation to make a sludge of the pulverized rock in the bottom of the hole. Every so often the hole must be bailed out or the drill bit will be striking pulverized rock instead of the solid rock to be drilled.

The *pneumatic hammer* is adapted to many different types of drilling machines. A valve admits compressed air to a cylinder which pushes a piston. The piston exposes exhaust ports at the extreme end of its travel and compressed air admitted on the other side of the piston returns it to the other end of the cylinder. The piston reciprocates at high speed hitting hammer blows on the shank of the drill steel. Some pneumatic hammers have a ratchet arrangement which causes a positive rotation of the drill steel. The drill steel is a solid piece of steel with a water hole down the center. Water is used for cooling the bit and removing the cuttings. Successively longer pieces of steel must be used to deepen the hole. Drill bits are made in different designs of alloy steel; they must be hard but not brittle. They are usually threaded to screw on to the drill steel. When the bits become dull they are heated, and resharpened in a forging machine, and then they are tempered and returned to the mine for re-use. The bits may be resharpened until the wings have been ground flush with the diameter of the body of the bit. Tungsten-carbide inserts are used on the cutting faces of some bits and this material increases the drilling speed and the life of the bit.

Wagon drills are another type of drill fre-

quently used for stripping or mining operations. The machine is a pneumatic hammer mounted on a tripod. Wheels are placed on two of the legs of the tripod for ease in moving the drill. The pneumatic hammer is moved up and down automatically by a threaded shaft which meshes with corresponding threads on the bottom of the drill. Holes of from 1½ to 3 inches in diameter may be drilled in this way to depths of 20 feet.

Another method of surface mining, known as *placer mining*, is peculiar to those near-surface deposits which have been formed by the action of wind and water carrying valuable minerals away from the mother lode and depositing them in concentration among the gravels at the bottom of streams. Gold and tin minerals are found in this type of deposit. These gravel ore bodies may be mined by using hoses known as giants with high water pressure. The jets of water are directed against the gravel beds and the impact washes the gravel down where it is channeled into sluice boxes, in the case of gold, or into conduits for transportation to the concentrator, in the case of phosphate or tin minerals. The sluice box is an open trough with riffles in the bottom, usually made in 12-foot sections. Mercury is placed in the riffles and the gold is amalgamated when it comes in contact with it.

Placer deposits are also mined with dredges which are in fact self-contained mining and concentrating plants. A gold or tin dredge is a barge on which the concentrating plant is housed. The mineral bearing material is usually scooped from beneath the surface of the water by a chain of buckets which move over a boom positioned so that the buckets scoop the bottom. The barge is moved about the pond by its own winches. The dredge digs a channel and may fill in behind itself by discharging the waste from the concentrator plant over a stern boom. Deposits having as little as .01 ounce per square yard of gold can be mined economically in this way because a large volume of material can be handled cheaply.

Underground Mining.—This is a highly mechanized operation everywhere except where labor is cheap. Shafts or tunnels are driven to gain access to the ore body. Other tunnels are driven to follow the vein or outline the block of ore. A tunnel following the vein or paralleling the plane of the ore body is known as a drift and one at right angles to the plane of the ore body as a crosscut. Connections between tunnels at different elevations in the mine are usually driven from the lower elevation to the higher and are therefore called *raises*. The advantage of raising is that the rock is moved from the excavation by gravity after it has been drilled and blasted and, therefore, no shoveling is required. Wherever possible in a mining operation, gravity is used to advantage. It is almost a rule that the ore is extracted from the bottom to the top or in successive lifts a few hundred feet apart, each being worked from the bottom up.

Mining machinery consists of drilling, shoveling, hauling, hoisting, and pumping equipment. Pneumatic hammers of various designs are used almost exclusively in hard rock for drilling the blastholes. Jackhammers are used for down holes, stopers are used for up holes or at rising angles from the vertical. The stoper is a pneumatic hammer with an elongated body. Below the hammer mechanism is an open end cylinder in which is a piston about 3 to 4 feet long. Compressed air is admitted on top of the piston and

it is pushed out. Since one end of the piston is placed on the ground, the other supports the hammer and keeps it pressed against the rock as it drills the hole. The Leyner drill is used mostly for horizontal holes and is a fully automatic pneumatic drill. The machine has a screw gear feed for advancing the drill shaft into the rock and withdrawing it. Holes are drilled from $1\frac{1}{2}$ to 3 inches in diameter. Much attention is paid to the type of drill bit which is used as it is an important item of expense. In softer rock such as coal, salt, or potash deposits, augur-type drills are used. These are rotary drills, in contrast to the pneumatic percussion drills, and may be driven by compressed air or electricity. To operate these pneumatic drills and other air-driven equipment, compressor plants are used. They may be situated on the surface or underground and are usually electrically driven. The average air pressure is about 90 psi (pounds per square inch) at the drills. An advantage of the use of compressed air for driving mining machinery is that it provides an additional source of air supply for ventilating the mine openings.

Underground Loading Machines.—These are made in several different types. The simplest device is the slusher. This consists of an air- or motor-driven hoist which pulls a scraper back and forth across the ground, pulling the ore to a loading chute. Other type loaders are mounted on track, rubber tires, or crawlers, and use buckets for scooping up the rock and loading it into cars. They are especially designed for working in confined openings and are driven by air, electricity, or Diesel engines.

The standard type loading machine, used in driving tunnels in metal mines, is a compact, sturdy, compressed-air-driven machine. It moves on a track and has a carriage with rigidly mounted, flanged wheels. On top of the wheel ruck is a turntable which permits the shovel to swing in a wide arc. The dipper is trapezoidal in cross section and is rigidly supported on rock-

ers or arms which, in turn, are fastened to a journal fulcrum on which they swing through a vertical arc. This permits the machine to pick up broken rock in front of it and transfer it directly over the machine, and empty it into a mine car hooked on behind the loader. The arms or rockers may be moved by a sprocket chain which winds on a drum powered by a compressed-air motor. The air motor also moves the loader forward and backward on the track. The operator of the machine stands on a platform or walks beside the loader, and controls its operation by two air valves and the weight of his body to swing the dipper from side to side. One air valve controls the propulsion of the loader and the other regulates the action of the dipper.

Fig. 2. Mechanization and cyclical operations feature the operation of modern iron ore mines. These methods are equally applicable to other flat lying massive ore deposits such as coal.

In mines where larger openings can be made because the rock is strong enough to sustain them, caterpillar mounted loaders are used. These, because of their great maneuverability, can do a more thorough cleanup job.

Another type of loader, which is used in driving fairly large diameter tunnels, is mounted on a track but has a conveyor boom in front with the dipper attached. The dipper receives its motion from cables winding on drums and the digging action of the dipper resembles that of flexing the wrist holding the palm up. The conveyor on the boom has an articulated joint so that it can be swung with the boom without disrupting the conveyor.

One type of coal loader consists of a scoop, inside which are two groups of hooks fastened to endless chains which revolve toward each other and gather up the coal as the scoop is pushed into the broken coal pile. The hooks carry the coal to

the top of the scoop and discharge it on to a conveyor which carries the coal to the back of the machine where it is dumped into a car. The scoop, conveyor, and motors are mounted on a self-propelled carriage moving on tracks or rubber tires.

FIG. 3. A chute for loading broken ore from a stope into mine cars. Here an air-piston operated gate is used.

Hauling.—Haulage of the broken ore out of the mine may be accomplished by battery, trolley, compressed air, or Diesel-powered locomotives pulling cars on rails; by battery or trolley rubber-tired cars, known as shuttle cars; by shaker and/or belt conveyors; and by trucks where the mine openings are big and access is through a tunnel. The shuttle car is either of the storage battery or trolley-reel type. It is a rubber-tired vehicle designed to work in openings with restricted headroom. In the bottom of the car is a chain conveyor which unloads it.

FIG. 4. Typical plan for the entry system and panel mining of coal. All of the rectangles are pillars of coal which are left to support the roof.

Hoisting.—When vertical or inclined shafts are sunk to reach the ore body, it is necessary to install one or more hoists to carry men and materials to and from the surface and to lift the ore from the mine. An enclosed platform called the cage is used for hoisting men. Buckets with capacities from 1 to 15 tons are used for carrying the ore; they are called skips. Ore hoisting is usually done with balanced skips, that is, one skip goes up as the other goes down and the rope may be wound on one drum, or two direct-connected or clutch-connected drums. Balanced hoisting saves power. Electric motors are used almost exclusively for driving the hoisting drums. A tower, known as a headframe, is usually erected over the collar of the shaft so that there can be a silo for storing the ore between the point on the headframe where the skips are dumped and the mouth of the shaft. The ore is drawn from the bottom of the silo and transported to the concentrating or preparation plant.

There is usually ground water flowing into mine workings in addition to the water that is used for keeping the dust down while drilling, so that it is necessary to pump it out to keep the workings from becoming flooded.

Ventilation.—This is also an important problem in mining. In big mines, giant blowers are placed at the surface or at the bottom of one shaft and the air is circulated along a course through the mine by placing barriers to direct it in the planned circuit. Two means of access to mines are required so that it is convenient to use one tunnel or shaft for the incoming air and one for the exhaust air. Small auxiliary blowers are used to bring ventilation air to out-of-the-way places in the mine.

In mines where explosive gases may be present, as in coal mines, so-called permissible equipment must be used. This means that the equipment must not cause any sparks that might set off explosions or start fires.

Diamond Drilling.—This is the only sure method of finding out whether there is an ore body in the ground without sinking a shaft or tunneling into the earth. It is the main instrument used in exploration. The machine is capable of drilling a hole a few inches in diameter to depths exceeding 10,000 feet, at the same time cutting a core of rock which is periodically removed from the hole. The core gives the geological information necessary to determine the presence of an ore body.

Equipment consists of the drill, drill rods, drill bits, hoist, pump, and source of power. Gasoline engines are used extensively, but steam, electric, and compressed-air engines are also used. The drilling machines can be differential-gear-screw feed or hydraulic feed. In the latter, the piston motion is transformed into a rotary motion by piston, bevel gear, pinions, and crankshaft. The drill rod is held in a chuck which rotates it. Drill rods are made of seamless tubing which comes in standard lengths of 1 to 10 feet, sometimes longer. The rods are screwed together, and also screwed to the core barrel which is equipped with a beveled ring that grips the core of rock when there is an upward pull on the drilling tools. Drill bits are made in numerous designs but, essentially, they are like steel nipples, threaded at one end, and with diamonds set in the other end, and around the outside and the inside periphery of the bit for a fraction of an inch back of the leading edge. The bit is also carefully machined to provide appropriate grooves and orifices for supplying water to cool the bit and carry away the cuttings from the bottom of the hole. The drill bits are expensive because of the diamonds and handwork used in setting them.

The bits may have cut stones set a fraction of an inch apart, or a fine diamond powder may be sprinkled in a hard-metal matrix on the cutting surfaces. After the stones become dull they are returned to the manufacturer so that the diamonds may be recovered, sharpened, and reset. The bits are manufactured in different diameters because, as the drill hole gets deeper it gets narrower, and it becomes necessary to use smaller diameter drilling bits.

Concentration.—Ore from the mine cannot be marketed without some preparation. For instance, ore containing five per cent copper cannot be economically treated at the smelter. Coal usually must be separated from waste rock before

It can be sold, and traprock to be used for making roads must be of specified size. Ore dressing, often called beneficiation, consists of mechanical crushing and separation processes. Ore is crushed to prepare it for use or for some future steps in processing. In the case of ores of nonferrous metals, which are the most complicated in their metallurgical treatment, the particles of ore are crushed to the average size of the mineral particles constituting it so that in the separation processes the waste may be discarded with as little mineral waste as possible; conversely, the separated valuable mineral or minerals will have as little waste mixed in as possible.

In the crushing phase of ore dressing, many different types of crushing and grinding machines are used, each of which is particularly adapted to making a certain size reduction or to handling a certain type of material. A yardstick for comparing crushers is the reduction ratio, which is the ratio of the coarsest particle of feed to the coarsest particle of the crushed product.

Crushers.—Jaw crushers are standard primary crushing machines and are made in several different designs. The machine consists of two crushing faces or jaws, one of which is stationary and the other moves alternately toward and away from the stationary face. The motion of the moving jaw is relatively small and is a swinging movement about a fulcrum which may be either at the top of the jaw structure or at the bottom. The machines are of rugged construction and have replaceable alloy steel faces on the crushing surfaces. The opening through which the ore is fed into the crusher is relatively large as it must take the coarsest pieces as they come from the mine. The discharge opening can be adjusted to deliver the size product desired but is a matter of inches in width.

The Blake-type jaw crusher has the fulcrum at the top of the moving jaw. It receives its movement from a shaft driven by belts from a motor. An eccentric on the shaft moves a vertical "pitman" similar to a connecting rod which is in turn attached to a toggle which transmits the motion to the movable jaw. Flywheels are used with jaw crushers because of the variable load imposed on them. The Tel-smith jaw crusher is similar to the Blake except that the main shaft eccentric works the jaw directly through a horizontal pitman. The jaw crusher is a large capacity machine able to crush 300 tons of rock received through a 60- by 48-inch opening to a 9-inch size in an hour. A reduction ratio of 7 is frequently attained.

Gyratory crushers were developed after the jaw crushers to supply a machine with even greater capacity. The stationary crushing surface in this machine is a hollow truncated cone with the smallest opening at the bottom. The moving, crushing element is also a truncated cone placed inside the stationary cone but with its largest cross section at the bottom. In the suspended-spindle type of gyratory, the moving cone is rigidly fastened to a spindle which is suspended from the top. A motion which is gyratory in the horizontal plane is imparted from an eccentric sleeve which is fastened to the bottom end of the spindle and, also, to a bevel gear that meshes with another bevel gear which receives its motion from the main shaft. The rock enters at the top of the crusher and is crushed between the cone surfaces by the gyratory motion of the inner cone. The discharge opening of the gyratory crusher

can also be adjusted for different sized products. One of the largest size gyratories has a 72-inch receiving opening and will handle roughly 3,000 tons per hour reducing the rock to a maximum size of 12 inches. The most frequent trouble encountered with crushers is that they may become jammed if a piece of metal too large for the discharge opening gets caught between the crushing surfaces. Some designs overcome this difficulty by automatically increasing the size of the discharge opening when a stress is put on the crushing surface which exceeds that necessary to break the rock for which the crusher was designed. After the obstruction has been passed the crusher automatically returns to its normal setting.

Cone crushers are modifications of gyratory crushers. The crushing surfaces are two truncated cones one set on top of the other but, unlike the gyratory, the apices of the two cones are on top so that the crushing opening is between two nearly concentric surfaces. This arrangement permits increased volume for the discharge and, therefore, greater capacity for the crusher as compared with the crushers previously described. The top crushing surface is held in place by springs which permit it to move up to pass "tramp" metal.

It is frequently necessary to do the crushing of rock, preparatory to the separation processes or the grading of different size marketable products, in more than one stage of crushing. In such cases, screens are used in series, following the crushers to separate the rock according to size. The oversize material is usually passed through another crusher to reduce it to the proper dimensions. Gyratory and jaw crushers are used as primary crushers whereas cones most frequently are used for the large volume of finer crushing.

Crushing rolls consist of two revolving cylinders rotating toward each other between which the ore is crushed. One cylinder is held by stationary bearings but the other is held in spring-cushioned bearings so that there will be sufficient play to pass tramp material between the rolls without breaking them. Rolls are characterized by a small reduction ratio and the production of a minimum of fines. This latter is probably true because the rock remains in the crushing area only briefly.

Grinders.—This differs from crushing only in the size of the particles being reduced, grinding dealing with the finer material. The reduction ratio is much higher, being of the magnitude of 50 to 100. The grinding phase, when used, is the final pulverizing step before the ore is subjected to separation processes.

Ball mills are grinding machines which use steel or iron balls as a grinding medium. The vessel in which the operation is performed is usually a steel cylinder but may be a cylindrical drum which revolves about a horizontal axis. The drum is supported on trunnions which ride in bearings mounted on concrete pedestals. The drum is made to rotate by a giant gear which encircles the drum and meshes with another gear fastened to the drive shaft. The material to be ground is fed into the mill by a spiral scoop fastened to one of the trunnions, and is crushed by the tumbling action of the balls. Three methods of discharging the pulp are recognized: through screens along the shell, by free overflow through one of the trunnions, and

through a grate across the full section of the mill and then over the lip of the discharge trunnions. Inside the mill, liners are generally used to prevent wear on the drum shell and sometimes to aid in lifting the grinding medium so that it may fall on the material to be treated. Types of liners are smooth, shiplap, wave, and wedge bar; they are replaced as they wear out. Grinding may be wet or dry depending upon whether the addition of water will be helpful or detrimental to later stages of preparation. The consumption of grinding media and liners is a considerable item of cost in grinding mill operation.

FIG. 5. A new type of ball mill, the Hardinge Tricone, which is used for grinding ores.

Rod mills are similar to ball mills in design and operation. Steel rods are used instead of balls for grinding medium, and the cylindrical vessel is of greater length than diameter which may not be the case with ball mills. The rod mill is characterized by more uniform grinding as the rods are held apart by the coarser particles which receive preferential grinding.

Screens.—In commercial practice, during all crushing and grinding operations, it is necessary to separate material according to sizes, reducing the load on machines by bypassing material which has been sufficiently reduced in size. In the coarser crushing operations screens are used, but in the finer grinding operations classifiers do the sizing.

The simplest type of screen is the *grizzly*, which consists of parallel bars spaced according to the maximum size material that it is desirable to handle. Grizzlies may be placed underground in the mines so that the big boulders will be broken up before being hoisted to the surface. Steel rails are frequently used for making this type of grizzly.

Moving type screens are more common, as they give better screening and act as feeders. Trommels, and vibrating and shaking screens, are the common types.

Trommels are, commonly, cylindrical shells of punched plate revolving about a central axis, which is set at a slight angle to the horizontal, so as to feed the material through the cylinder. Water may be used with a trommel to wash the fine material from the coarse. The coarse material not passing through the holes is delivered at the end of the trommel.

Vibrating screens utilize a reciprocating motion of the screen normal to the bed. The vibration may be imparted mechanically or electrically. Mechanical vibration can be accomplished by a cam with a return-motion spring or by unbalanced flywheels. In electrically vibrated screens

the motion is imparted by the action of an electro-magnet on an armature. Vibrating screens are frequently decked one on top of another so that several sized products may be extracted. It is important that a minimum of the vibration be imparted to the mounting, that the vibrating mechanism be dust proof for protection from damage, that the screens may be easily changed, and that there be a minimum of loss of headroom in the screening operation.

Classifiers.—These are used to make separations according to size or specific gravity, depending on the nature of the processes for which the ore is being prepared; for flotation, a size separation is necessary, whereas for tabling, the accent is on specific gravity.

There are several types of classifiers for making separations according to specific gravity and they all use the hindered settling principle. The crushed material along with water is fed into a vessel, where settling takes place against a rising column of water. The heavier particles settle rapidly and are removed, whereas the lighter particles overflow into the next chamber where the process is repeated but with a different velocity of the rising water column. The process may be repeated as many times as necessary for the number of minerals of different specific gravity.

Sizing classifiers utilize free settling as much as possible to permit the coarser particles to settle to the bottom while the finer particles are overflowed. No more water is required than is already in the suspension. The rake classifier is a common machine of this type. It consists of an inclined tank, usually of metal, in which is suspended a series of rakes which move in a rectangular motion with rounded corners. The top end, over which the sand or coarse particles are discharged, is open while the bottom is only partially closed permitting water with the fine material to overflow. The action of the rakes intermittently pushes the sand to the top and permits the fines to settle. The rakes receive their motion through appropriate gears, cams, cranks, and connecting links. This process may be used with multiple-rake machines.

The spiral classifier operates on the same principle as does the rake classifier except that one or more spiral ribbons may be used to impart the upward motion to the coarser material. This machine has fewer moving parts and the spiral may be lifted from the tank easily when the machine is not in operation.

Jigging.—A method of concentration of ore depending for its effectiveness on the difference of specific gravity of the mineral to be concentrated and of the gangue or waste. The separation is accomplished on or through a sieve upon which is a dense suspension or bed of minerals to which is imparted a pulsating motion. The pulsating motion is usually provided by the action of a piston in an adjacent compartment connected to the jigging compartment with a fluid, to transmit the pulsating movement of the piston. This action causes an alternating, more open, and more compact bed which permits rearrangement of the minerals, so that the dense ones work their way to the bottom where they may be removed or passed through the sieve, and removed in the compartment below, called the "hutch." When it is desired to have a hutch product, it is necessary to have a bed of suitably high specific gravity minerals on top of the sieve, to prevent the waste

or lighter minerals from passing through the sieve and mingling with the concentrate.

Various designs of jigs are made for suitable concentration of materials, ranging from the extreme specific gravity of gold in small particles to the lighter and larger size pieces of coal. Material ranging in size from 5 inches to 20-mesh may be treated in jigs of appropriate design.

Shaking Tables.—These are devices for concentrating minerals by their difference in specific gravity, although their shape and size has some effect on the process. The table is roughly rectangular in shape and is tilted on its long axis. On the surface are a series of parallel riffles or cleats which are fastened to the linoleum top of the table. Each riffle is longer than the next one above it, making a diagonal line from the bottom corner at the discharge end, so that only about two thirds of the table is cleated. At the top corner, opposite the discharge end, is the feed box and, along the top edge of the table, is the wash-water trough with a series of baffles for regulating the flow of water along the entire length of the table. A shaking motion is imparted to the table by a pitman and toggle-type head motion; the speed of the table ranges from 180 to 270 strokes per minute with strokes from $\frac{1}{2}$ to $1\frac{1}{2}$ inches in length. The material to be concentrated is fed on the table near the head motion, and travels along it because of the shaking motion, while wash water passes over the particles at right angles to their direction of travel. The coarser, denser particles work to the bottom of the table where they are discharged, while the lighter ones pass off at the end of the table.

Flotation.—This is a concentration process which utilizes the addition of chemicals to the suspension of crushed ore and water, known as pulp, to create a froth to which the mineral particles adhere and are floated away from the pulp into the concentrate launder. There are several vessels of different design which are made to facilitate this process. Classification of the machines may be made according to the method by which air is introduced into the cell. The agitation cell entrains the air in a vortex in the pulp by the agitation of the impeller. The subaeration cell admits air through holes at the bottom of the impeller to which the air is piped. The cascade cells catch the air by tumbling the pulp. In pneumatic cells, the air is introduced by blowing. There are certain common features that all of these cells must provide in order that flotation of the valuable mineral may take place.

There must be a means for admitting the pulp to the cell, and an outlet for it. There must be a means for allowing the pulp to settle, for carrying off the froth, for admitting the air, and to regulate these features. The cells are compartmented and arranged in batteries so that correct circulation is assured, that is, one cell receives the defrothed pulp from the preceding cell.

The cell walls are made of metal or wood. The pulp enters the cell from the bottom and is agitated and pumped by the action of an impeller, which is driven by a vertical shaft attached to a motor atop the flotation cell. The agitation in the cell, the air, and the froth, forming chemicals, cause bubbles to form to which the mineral particles adhere. The froth is raked over the side of the cell into a launder by mechanically operated paddles. The level of the pulp is maintained by a weir. The defrothed pulp is channeled to

the next cell. In order for each mineral particle to have the opportunity to come in contact with an air bubble, it is necessary to allow from 5 to 15 minutes to float all of the mineral. This is accomplished by passing the pulp through a series of cells. Banks of 8 or 12 cells are common, the froth from the first 4 cells being called a concentrate, and the froth from the last 8 a "middling product," which is re-treated.

In the flotation process, the finely ground pulp may contain one or more valuable minerals which may be recovered separately or as a bulk concentrate, which is treated further by flotation to separate and recover the different valuable minerals. For instance, a pulp containing a lead and zinc sulphide mineral, galena and sphalerite respectively, will have the lead mineral floated off first, and then the pulp is treated by flotation, again using different chemicals for floating the zinc mineral.

Magnetic Separators.—Used for concentrating certain ores by taking advantage of the difference in magnetic properties between minerals. One type of magnetic separator consists of a horse-shoe electromagnet with a "keeper." In the gaps between the two poles of the magnet and the keeper revolve two drums built up of alternating laminations of permeable and impermeable material. The ore is fed to the first roll where the susceptible particles adhere to the roll until it is in a position where the strength of the adjoining secondary pole is nil, when they drop from the roll into a chute. The nonsusceptible particles leave the roll sooner and fall into a different hopper.

The wet-type magnetic separator consists of a tank divided into several compartments. An endless belt moves through the tank and is backed up by a series of electromagnets. Water and crushed ore are admitted at one end and the solid material is picked up by the belt. The gangue or nonmagnetic material is dropped in the first compartment, and the other particles leave the belt in the order of their susceptibility, the weakest dropping first, and the concentrate is delivered in the last compartment. The particles drop from the belt because of the winnowing action of the alternating pole magnets and the water currents.

After an ore is concentrated by magnetic means, it is usually necessary to demagnetize it, as the particles retain a certain amount of residual magnetism. Demagnetizing may be accomplished by passing the ore through an alternating current coil of diminishing diameter in the direction of flow, so that there is a reduction in the intensity of the field as the ore passes through the coil.

Magnetic pulleys are also used for removing tramp iron from the ore being fed to a concentrating plant. They are of the electromagnetic type.

Thickening.—A process used in the first stage of dewatering the concentrate pulp. It is necessary to remove the water from the concentrate when smelting is to be used for the recovery of metal; also, it is not economical to pay freight on the moisture when the concentrate is shipped. Thickening is a settling process which is performed in a large cylindrical tank, about 10 feet deep, with a flat-conical bottom. It is often located outside the mill building, which reduces construction costs, and is sometimes as much as 200 feet in diameter. It may be constructed of concrete, metal, or wood. The pulp to be thickened is conducted by a launder to the feed well at the center of the tank. The clear water over-

flows into a duct which is around the inside periphery of the tank, while the solid particles settle to the bottom of the tank. Paddles slowly rake the bottom of the tank, moving the solid particles to the center discharge opening. A diaphragm pump lifts the solids from the bottom discharge opening. The paddles used to rake the bottom are attached to a central revolving shaft which is driven through speed reducers by a motor, located on a platform at the center of the tank or on the edge of the tank. If the motor is at the edge, it is placed on a platform which moves on wheels on a track which is around the outside periphery of the tank, the driving assembly being connected to the central shaft by a steel truss. In arid regions, the recovery of clear water for recycling in the mill is as important as thickening the concentrate. The thickened solids from the tank are then filtered before shipment.

Filtering.—A continuous operation performed for the most part on drum or disc-type filters which are covered with cloth. In either case the drum or disc revolves, partially submerged in the thickened concentrate. The disc or drum is divided into compartments so that suction or pressure may be applied as required. Suction is applied as the filter cloth passes through the concentrate, holding it to the surface of the cloth, and the suction continues as the disc or drum revolves, pulling out the filtrate. When the drum turns to a position over the discharge hopper, pressure is applied, blowing the filter cake from the cloth. Filtering machines are necessarily expensive and intricate, because of the valve arrangement for providing pressure and suction.

Heavy Density Separation.—A commercial adaptation of the mineralogical laboratory heavy-liquid separation technique. Essentially, the process uses some heavy mineral, such as finely ground silica sand, galena, or ferrosilicon to make a liquid-solid suspension of an intermediate density between the mineral and waste constituents of the ore. The process uses a variety of equipment, including screens, classifiers, thickeners, magnetic separators, pumps, motors, and a separatory vessel which may be a cone, spiral, or drum type.

In essence, heavy-density separation can perform the following operations: (1) production of a finished concentrate and a rejectable waste in one operation; (2) sorting of the waste from the ore, leaving an enriched product which may be treated further after reduction in size; (3) production of a finished concentrate and low-grade reject for additional treatment.

The basic steps in the heavy-density separation process are: preparation of feed, heavy-density separation, removal of the medium from the separated product, and reclamation and cleaning of the medium for re-use.

Preparation of the feed comprises wetting of the ore to wash off slimes and fines which dilute the medium, and to separate particles adhering together so that they will react better to the settling process. Use of ferric media and magnetic concentration make it unnecessary to remove all the slime, as the magnetic concentration of the medium rejects it.

Heavy-density separation apparatus comprises a tank containing the medium, means for agitating as desired, means for feeding the ore, and taking away the sink-and-float products. The cone and spiral separator are types of vessels used. The cones are either closed- or open-top with inside

or outside air lift for removing sink. The closed-top cone is better suited to ores such as those of iron from which a relatively large amount of sink is to be removed. The open-top cone finds more use where there is a large quantity of float, as in coal cleaning. Sizes of ore up to $3\frac{1}{4}$ inches are introduced near the top of the cone, which contains a medium of a preselected gravity. The particles of higher specific gravity sink and are removed by an air lift while the particles of less specific gravity than the medium float on the surface and overflow a weir opposite the point of entry. Rakes mounted on a vertical shaft move the sink down the side of the cone and keep the medium in suspension. Cone sizes vary from 3 to 20 feet in diameter, the capacities depending on the specific gravity of the sink-and-float materials, the size of the feed, and the closeness of separation required. About 600 tons per hour may be handled by a 20-foot cone.

Products of the separatory vessel are drained and washed separately, the undiluted medium from the drain screen is returned to the separator, and the diluted medium from the washing screen is pumped through a constant magnetic field to magnetize the medium for acceleration of its settling rate. The pump discharges into a thickener which reduces the volume of pulp going to the magnetic separator, and it also acts as a storage tank from which medium losses may be replenished easily. The overflow may be used as spray water or sent to another thickener for further clarification before being used as spray water on the washing screens. The rake product of the thickener goes to the primary magnetic separator, and the reject goes to the secondary magnetic separator, from which the tailing goes to the waste pile or to some further form of treatment if it contains values. The clean medium from the magnetic separator is transferred to a spiral densifier that acts as a thickener, storage reservoir, and deslimer for clean medium. The clean medium is returned to the separatory vessel, passing through a demagnetizing coil which imparts a dispersing effect giving fluidity to the medium.

Heavy density separation processes are applied commercially to the washing of coal, and iron ore, to the concentration of lead, diamonds, spodumene, and garnet. See also COAL—Mining—Coal Preparation; GOLD MINING.

JOHN V. BEALL,
Editor, "Mining Engineering," *American Institute of Mining and Metallurgical Engineers*.

MINISTER, a high officer of state entrusted with the administration of any department of state government. Collectively, the persons who constitute the administration are called in Europe the ministry, and also the Cabinet. The term minister is seldom applied in the United States to members of the Cabinet, but is used, as in Europe, to designate diplomatic officers who differ from ambassadors in that the latter hold power as personal representatives of the head of the government. The technical title of ministers is envoy extraordinary or minister plenipotentiary. In Great Britain the term is used to

designate the entire body of secretaries which is called the ministry. The executive government of France is divided into 10 departments or "ministries." See also AMBASSADOR; CABINET; ENVOY; CONSUL; AMERICAN DIPLOMACY.

MINISTER'S WOOING, The, a novel by Harriet Beecher Stowe, first published in serial form in the *Atlantic Monthly* in 1859. The scene is laid in New England, and deals with the habits and traditions of the close of the 18th century. The "minister" in the tale is the famous Samuel Hopkins (q.v.) 1721-1803, the founder of "Hopkinsianism." The central purpose in this story is to show the sternness and inflexibility of the New England conscience, which clings to the Calvinistic doctrines through all phases of life. The struggle that goes on in the heart of the heroine and her mother when the brother and son, James, is supposed to be drowned and unconverted is a graphic delineation of the moral point of view at that time.

MINIUM. See LEAD.

MINIVER, the Siberian squirrel, which has fine white fur; also the fur itself.

MINK, a circumpolar species of weasel (family *Mustelidae*), valuable as a fur-bearer, known in North America as *Putorius vison*, and in the Old World as *P. lutreola*, although substantially the same animal. The mink is a true weasel, with 34 teeth and not a marten with 38; but it is of larger size, being 24 to 27 inches long, one-fourth of which belongs to the tail, and has a stouter form and bushier tail, more like the martens. Males are much larger than females. The mink differs greatly from both weasels and martens, and in those points in which it is modified toward this mode of life, namely, the half-webbing of the toes, short ears and close-set, bristly, glistening pelage, it makes an approach toward the others. In color the mink ranges from dull yellowish-brown to a rich blackish chocolate-brown. The ordinary color is a dark reddish-brown, growing blackish on the tail and marked by a white patch on the chin of variable extent. The pelage consists of a dense, soft, matted underfur, mixed with long, stiff, lustrous hairs on all parts of the body and tail. The gloss is greatest on the upper parts; on the tail the bristly hairs predominate. Northern specimens have the finest and most glistening pelage; but the rough treatment given its coat by the animal in scrambling through holes and crevices in rocks, rotten logs and broken ice so rapidly damages its fur that only the pelts taken in early winter show the fur to perfection and yield full value to the trapper. Both sexes are extremely odorous, due to the secretion, equally in both sexes, of a fetid musky scent in small perineal sacs opening near the orifice of the rectum, on each side; the smell is powerful, penetrating and lasting, and is under voluntary control of the animal, but it cannot be discharged like that of the skunk, and is by no means so overpowering. The purpose of this secretion is undoubtedly the attraction of the sexes, and it is used to advantage by trappers as a scent-bait for their traps.

Minks occur in all parts of North America, and are so prolific, so well supplied with food and so secretive that they survive numerous

even in the more thickly settled parts of the country. They abound near the coast and in the neighborhood of the larger lakes, rivers and marshes, but are to be found along almost every stream, even in the driest portions of the interior. The minks cling to the water-courses, where they find plentiful food in the form of meadow-mice, frogs, mussels, fishes (especially eels) and insects. In New England, at least, they feed largely on earthworms, getting them in plenty even in midwinter; and when very hungry, or a good opportunity offers, do not hesitate to attack larger animals, as muskrats—which they are able to pursue through underwater ways into their houses,—rabbits, partridges, ducks and poultry. They search the stream-banks for prey, diving and swimming long distances with ease, go about under loose ice and snow, climb rough-barked trees and penetrate crevices and hollows almost with the ease of a serpent, so that nothing is safe from their inquisitive ferocity, and in winter they wander widely.

Their own homes are made in burrows, usually but not always opening in the bank of a stream, and are more often accidental than carefully contrived. In some such retreat the female brings forth in early spring her litter of four or five young, which she guards with great care and courage from all enemies, including the males of her own species. The kittens, and the older ones indeed, exhibit the same playfulness in and out of the water which characterizes otters.

No fur-bearing animal is so unsuspicious of traps and so easily caught as the minks; and they are the victims of boys and amateurs as well as of professional trappers in all parts of the country. The value of the pelts varies with their color, condition, size and the varying demands of changing fashion, but good ones are always of sufficient worth to make them reward the trouble of taking. When captured young they are easily habituated to confinement in suitable pens, and are tamable to a certain degree. They will breed in captivity, and there are several thousand mink farms in the United States and Canada which breed the animals for their pelts. The minks are fed upon fish and coarse meat, etc. The sexes are kept separate except during the month of March, and reproduction begins when the female is one year old. Tame minks make excellent ratters, doing the duty of ferrets.

Consult Audubon and Bachman, 'North American Quadrupeds' (Washington 1851); Coues, 'Fur-bearing Animals' (1877); Cram, 'Little Beasts of Field and Wood' (New York 1899); Stone and Cram, 'American Animals' (ib. 1902); Hollister, 'A Synopsis of American Minks' (Washington 1913); Seton, 'Life Histories of Northern Animals' (New York 1909).

MINK FROG (*Rana septentrionalis*), a small frog inhabiting the northwestern United States. It measures two and one-quarter inches from nose to vent and is dark olive-green above with sooty brown bars and spots and is pure white beneath. In general effect the hue resembles that of the mink, whence its name. Its habits are quiet and solitary. Consult article by H. Garner in *The American Naturalist* (Vol. XVII, Philadelphia 1883).

MINNA VON BARNHELM. Lessing's *Minna von Barnhelm or The Soldier's Fortune*, a comedy of five acts in prose—begun 1763, published 1767—is most important for the rise of modern German literature since it was the first dramatic work of timely interest growing out of great national events (consult Goethe, *Dichtung und Wahrheit*, Book 7). It takes place at a hotel in Berlin about six months after the conclusion of the Seven Years' War (1756–1763), and, according to Goethe, purposes to relieve in a simile, as it were, the hostile tension between the defeated Saxons and the victorious Prussians. The Prussian Major von Tellheim desires to be guided above all by his rigid sense of honor, which forbids him to owe his entire good fortune to a woman or to make a woman share in a life which, as far as appearances go, may be exposed to contempt. Minna von Barnhelm, his fiancée, a beautiful and rich young lady of Saxony, fixes her eyes steadily upon Tellheim's sterling character, disregards the opinion of the world and by a well-meant artifice makes him realize that love's highest gratification is to stand by the beloved person in trouble. Minna conquers. True love proves superior to an extreme feeling of honor, although the value of the latter is by no means denied. In *Minna von Barnhelm* a deep moral problem is proposed and carried almost to a tragic turn. But the charm of Minna and the naturalness of Franziska and the sergeant captivate the spectator; the rascals are easily seen through, the atmosphere is conciliatory, the jokes to the point. For all this, the genuine spirit of comedy is ever present, and *Minna von Barnhelm* can maintain its place among the best specimens of the higher type of comedy.

Consult edition of Lessing's works in *Deutsche National-Literatur* (1882–1898, vol. 2); English translation in *Harvard Classics*, vol. 26; Kettner, G., *Ueber Lessings Minna* (Berlin 1896); Kettner, G., *Lessings Dramen in Lichte unserer Zeit* (Berlin 1904); von Stockmayer, *Die deutschen Soldatenstücke des 18. Jahrhunderts seit Lessings Minna von Barnhelm* (Weimar 1898).

EWALD EISERHARDT.

MINNEAPOLIS, city, Kansas, Ottawa County seat, altitude 1,380 feet, on the Solomon River and on the Atchison, Topeka and Santa Fe and the Union Pacific railroads, 25 miles northwest of Salina. Surrounded by an agricultural area, producing grain, poultry, and livestock, the city's business has to do principally with the processing of foods. It has a mayor and council. The water supply, light, and power systems are all municipally owned. Pop. (1950) 1,796.

MINNEAPOLIS, Minn., is the largest metropolis in Minnesota, the county seat of Hennepin County; a principal cultural, financial, and industrial center, serving the vast agricultural region of the upper Midwest. In 1950 its population was 521,718. It is located in the gently rolling terrain of eastern Minnesota on both sides of the Mississippi River, 1,900 miles from its mouth at New Orleans and 550 miles (channel distances) from its source in Lake Itaska in northwestern Minnesota. A beautiful city with gleaming skyscrapers, modern mills, and spacious residences sprinkled among the lakes within its boundaries, it is often called "a park with houses." Within the city boundaries are 22 lakes—large and small. Minneapolis has an elevation of 838 feet at its airport, Wold Chamberlain Field. Its climate is characterized by wide variations in temperature, scanty winter precipitation, normally

ample summer rainfall, and a general tendency toward extremes in all climatic features. Winter temperatures frequently drop as low as $-20^{\circ}\text{F}.$; in summer, maximum temperatures exceeding $90^{\circ}\text{F}.$ occur on an average of 15 days, but heat waves are usually of short duration. The average mean temperature for winter is $16^{\circ}\text{F}.$, and for summer $70^{\circ}\text{F}.$ The average annual precipitation is 27.08 inches: more than 50 per cent (14.44 inches) is normally received during May, June, July, and August.

History.—The first white man to visit the present site of Minneapolis was Father Louis Hennepin (q.v.) on a voyage of exploration in 1680. The falls which he saw there he named after his patron saint, St. Anthony. The next recorded explorer to pass through the area was Jonathan Carver, an American colonist who arrived in 1766. After the Louisiana Purchase (q.v.) transferred the area to the United States, Zebulon M. Pike, in 1805 on a mission for the new republic, was deceived by fur traders into believing that he had arranged a site for a military post there. Following his departure the American flag was torn down. In the next decade the American rights to the Louisiana Purchase were made secure, and in 1820 a fort that was first called St. Anthony and later Snelling was established a short distance south of the falls at the confluence of the Mississippi and Minnesota rivers. Its chief purpose was to protect American fur traders from the forays of hostile Indians. A few settlers began to move in. The village of St. Anthony was platted in 1848 and incorporated as a city in 1855. Meanwhile, Col. John Harrington Stevens filed claim in 1849 to a large section of what is now the downtown district of Minneapolis and platted it as a town in 1854. Its name had already been chosen when, at a meeting of citizens in 1852, Minneapolis was adopted as the official name. It combined an Indian word meaning water (minne) and the Greek word meaning city (polis) now popularly translated as the "city of falling water." Minneapolis was incorporated as a town in 1856 and, after 1860, began to grow very rapidly. It was chartered as a city in 1867, and in 1870 had a population of 13,066. The two cities of St. Anthony and Minneapolis were united by act of legislature into the city of Minneapolis in 1872. The natural waterfalls of St. Anthony provided power to drive the early lumber and flour mills. Eventually, as the agriculture of the region burgeoned, the mills of Minneapolis became known as the world's largest producers of flour.

Population.—Minneapolis is peopled with an ambitious and energetic citizenry. Approximately 86 per cent are native-born whites, 13 per cent are foreign-born whites, and 1 per cent are non-white. The native-born whites and foreign-born whites are principally of Anglo-Saxon and Northern European stock—predominantly of Scandinavian origin. Minneapolitans pride themselves on their neat homes and well-kept premises; 51 per cent of the residents within the city own their homes, and the suburban homes are about 80 per cent owner-occupied.

In addition to Minneapolis proper, another 112,000 persons dwell in the girdle of park-like suburbs that surround the city. Minneapolis' ten principal suburbs are related to her not only through economic ties, but also for services such as electric power, water, sewerage, and gas. . . . estimated 80 per cent of the suburban wage earn-

rs are employed in Minneapolis, commuting in and out of the city daily.

Government.—Under the provisions of the home rule charter adopted in 1920, the voters of Minneapolis elect many of their city officials, both policy-making representatives and executive officers. The elective positions include the mayor, city treasurer, city comptroller, a city council composed of aldermen elected by wards, the 7 members of the board of education, 12 of the members of the board of park commissioners, 6 of the members of the library board, and 2 of the members of the board of estimate and taxation. Three of the boards to which members are elected also have ex officio members, and on all boards the city treasurer acts as treasurer and the city comptroller as comptroller. These boards act in both policy-making and administrative capacities. They may appoint their own employees, subject to civil service limitations, and each may levy a tax upon city property, subject to millage limitations imposed by the charter.

In addition to the partially or totally elective bodies, there are several appointive boards responsible for specific city government functions. The powers and duties of the department of public welfare are exercised and performed by an executive board composed of the mayor, two city council members appointed by the city council, and four members appointed by the mayor with the approval of the city council. This board has general and specific responsibilities for city health, hospitals, relief, penal and correctional agencies and institutions, vital statistics, and the appointment of the commissioner of health and other employees.

The city planning department is headed by a city planning commission, composed of the mayor; member each elected from and by the city council, the board of education, the board of park commissioners, and the county board of Hennepin county; and four resident voters appointed by the city council.

The police and fire departments each have a single executive head. The mayor is empowered to appoint the chief of police, but the chief fire engineer is appointed by the city council. Other appointees of the council include a city clerk, a city attorney, a city engineer, several street commissioners, a wharfmaster, an assessor, a purchasing agent, water works employees, and all other officers deemed necessary for the proper management of the city.

Industries and Businesses.—The metropolitan area of Minneapolis and its twin city, St. Paul (q.v.) include all of Hennepin, Anoka, Dakota, and Ramsey counties. The federal census of Manufactures for 1947 showed the car's production (value added by manufacture) in the area to be \$714,565,000. Minneapolis itself produces a wide variety of manufactured products. More than 1,300 manufacturing establishments were in operation in 1950. Industrial products range from heavy construction equipment to delicate heat-regulating devices and electronic controls.

For more than 70 years the flour mills and millers of Minneapolis have played an important role in supplying the world with the main ingredient of the staff of life. Minneapolis is headquarters for the five largest wheat flour milling companies in the world. The Minneapolis mills have a daily capacity of nearly 7,000,000 pounds of flour. These mills produce an annual average

of 16 million 100-pound sacks of flour, and export to every region of the world. Within the switching limits of the city are 71 terminal elevators with a total combined storage capacity of 93 million bushels. The Minneapolis Grain Exchange, a nonprofit association, is the world's largest cash grain market (1950). Grain receipts at the Minneapolis market have exceeded 300 million bushels a year.

The manufacture of linseed products is also a leading Minneapolis industry. Minnesota, North Dakota, and South Dakota raise about 80 per cent of the nation's flax crop, most of which comes to Minneapolis' linseed mills for processing into linseed oil and cake. Soybeans, another crop becoming increasingly important in the upper Midwest, also are processed in these mills. Probably because of the ready source of linseed oil, the manufacture of paint began early in Minneapolis. As of 1950, there were five large factories and several smaller plants with an annual production of about 6,000,000 gallons of paint, in addition to industrial preservatives and finishes. Among the city's other large industries are machinery, printing and publishing, dairy products, and apparel. Among less common products for which the city has acquired international fame are powdered milk and artificial limbs.

Minneapolis is the home of the 9th Federal Reserve District Bank. In 1950, the city had 3 bank corporations, 10 national banks, 7 state banks, and 1 savings bank, with total bank deposits running well over \$1,000,000,000.

The business district of Minneapolis is conveniently laid out. Hennepin Avenue, named for the discoverer of St. Anthony Falls, is the Broadway of the city; here are many of the city's theaters and places of amusement. Nicollet Avenue, so called in honor of another distinguished pioneer, is often referred to as the Fifth Avenue of the Upper Midwest, and is the center of retail shopping, not only for the residents of Minneapolis but also for many in neighboring communities and states. Marquette Avenue is known as the Wall Street of Minneapolis and runs through the financial district of the city.

The trade area of which Minneapolis is the center covers a large area of the upper Midwest. On the wholesale level, Minneapolis is the center of distribution for Minnesota, North Dakota, South Dakota, most of Montana, the northern third of Iowa, and the western half of Wisconsin. Some of the larger firms extend their operations into the upper peninsula of Michigan, and cover the entire area to the Pacific Ocean and as far south as Kansas and Utah. The retail trade area of Minneapolis includes Minnesota and its neighboring states.

Transportation.—Minneapolis is the railroad center of the upper Midwest. It is served by 10 trunk line railroads, four of which are transcontinental. These trunk lines operate over nearly 60,000 miles of track in 21 states. In 1950, five bus companies made daily runs in and out of Minneapolis and connected with bus routes serving the entire nation. In addition, 115 motor freight carriers operated regular service to provide quick and convenient transportation to any point in the United States. A network of fine highways centers on the city. A number of airlines provide daily service to distant points and, with its regularly scheduled service to the Orient, one of them has made Minneapolis a great national inland port. The city's 1,085-acre airport, Wold Cham-

berlain Field, ranks among the largest in air traffic volume in the nation. Minneapolis' municipal docks below St. Anthony Falls provide docking service for barges from all points on the Mississippi and Ohio rivers. The new Upper Harbor (scheduled for completion in 1954) is intended to provide more docking area above St. Anthony Falls and accommodate many new industries along the river's waterfront. Four pipelines deliver gasoline and light oil to Minneapolis at the rate of two and one-half million gallons daily (1950).

Education.—The University of Minnesota, a state institution, is located along the Mississippi River in Minneapolis. Its beginnings antedate the city itself. The development of the university, particularly since World War II, has brought it up among the leading educational institutions of the nation, not only in size of enrollment, but also in educational standing and national prestige. Affiliated with the medical school of the university is the Mayo Foundation for Graduate Medical Education and Research. (See also MINNESOTA, UNIVERSITY OF.) Among the other institutions of higher learning within the city are Augsburg College and Theological Seminary (Lutheran), the MacPhail College of Music, the Minneapolis School of Fine Arts, and the Dunwoody Institute, which last is one of the largest privately endowed trade schools in the United States.

In 1950, the Minneapolis public school system embraced 93 schools employing a staff of some 2,400 educators. Seventy of the schools were elementary, 11 were junior high schools, 10 were senior high schools, and 2 were vocational schools. The total enrollment was 67,020.

Cultural and Recreational Facilities.—The Minneapolis Symphony Orchestra (q.v.), one of the most traveled symphonies in the United States, has brought more fame to Minneapolis than any other cultural institution. Its home is the Northrop Memorial Auditorium on the campus of the University of Minnesota. Other cultural facilities include the University of Minnesota Art Gallery, the Walker Art Center, which is particularly noted for its collection of ceramics and jade; the Minneapolis Institute of Art, with its paintings, prints, tapestries, and furnished period rooms; and the Institute of Swedish Arts, Literature and Science, with its exhibits of glassware, textiles, and antique furniture.

Minneapolis has 147 magnificently landscaped parks interlacing its 22 lakes and lakelets, which with 14 public beaches, provide for both winter and summer sports. The park area totals nearly 6,000 acres. The largest park is Theodore Wirth Park with 681 acres. The parkway system known as "Grand Rounds," is 62 miles long and almost completely encircles the city. Deeply wooded Minnehaha Parkway winds along Minnehaha Creek and links Lake Hiawatha, Lake Nokomis, Lake Harriet, Lake Calhoun, Lake of the Isles, and Cedar Lake with Minnehaha Park in which are the Minnehaha Falls, commemorated in Longfellow's poem, *The Song of Hiawatha*. Minnehaha Parkway itself covers 144 acres of wooded hills and shelters the Stevens House, the earliest frame building in Minneapolis west of the Mississippi River. The Minneapolis park system is said to be one of the most outstanding in the United States from the standpoint of the number of acres, types of properties, character of development, and quality of maintenance.

There is a playfield for every square mile of residential area in Minneapolis. As of 1950, the city had 36 playgrounds conveniently placed throughout the park system. There were 45 baseball diamonds, 137 softball diamonds, 198 tennis courts, 45 skating rinks, and 5 golf courses. The five 18-hole golf courses are located in widely separated sections of the city and are easily accessible by motor or trolley. In addition, there are 11 private golf courses. Two of the courses keep their clubhouses open throughout the winter months.

The Minneapolis Aquatennial, a summer festival, provides colorful pageantry. The Aqua Follies, one of its special features, combines an original format of Olympics swimming and diving champions with stage and concert stars. Women students at the University of Minnesota train throughout the year for the precision routine of these water ballets. The Follies are staged at Glenwood Lake, one of the lakes within the corporate limits of Minneapolis. Another annual feature is the world famous Shipstad and Johnson Ice Follies which began in Minneapolis in 1933. The shows feature a dazzling array of talented skaters, gorgeous costumes, and novelties in under-ice lighting. Sustained brisk weather is responsible for the popularity of winter sports programs in Minneapolis. Skiing and skating are especially popular. Because of the numerous hills around the city, as well as the city's policy of training beginners, Minneapolis is considered the kindergarten for ski-jumping enthusiasts. The Minneapolis Park Board maintains an active program designed to teach youngsters and adults alike the fundamental of skiing.

Minneapolis, a city of lakes, is itself surrounded by many chains of lakes. The largest lake adjacent to the city is Lake Minnetonka with 110 miles of beautiful shore line. The area around Lake Minnetonka is a popular suburban district and many live at "the lake" throughout the entire year. All the lakes in and around Minneapolis are abundantly supplied with game fish. Each week end, winter and summer, thousands of residents take to the lakes to try their luck. Winter fishermen angle in the open through holes in the ice, or in fish houses which are darkened to permit underwater spearing.

Other Points of Interest.—Minneapolis has 371 churches, representing practically every faith and denomination. The city has 34 hospitals and also several outstanding clinics staffed by prominent medical specialists. Minneapolis early recognized the threat of infantile paralysis and invited the famed Australian nurse, Sister Elizabeth Kenny, originator of a new treatment for the disease, to come to the city and set up the Kenny Institute. The institute is now self-supporting and has treated thousands suffering from poliomyelitis.

The Minneapolis Public Library has 424 distributing agencies, including the main library, 15 community branches, a business branch, a social service branch, and a bookmobile branch. In addition, the library services hospitals, business offices, factories, elementary school stations, classroom libraries, and summer camps. The Minneapolis Public Library also operates the Hennepin County Library under a contract with the Hennepin County commissioners.

Minneapolis has two general newspapers: *The Minneapolis Star* (evening) and *The Minneapolis Morning Tribune*. There are also many week-

and monthly publications devoted to trades, professions, and commerce including one issued by the Minneapolis Chamber of Commerce which contains articles of civic and commercial interest. The city is a convention center, often drawing delegates from all over the United States. Some 300 conventions are usually held in Minneapolis each year, a majority of which are state and regional. In 1950 there were 10 radio stations in Minneapolis and 2 television stations.

GORDON W. COWAN,
News Editor, "Greater Minneapolis."

MINNEAPOLIS SYMPHONY ORCHESTRA, founded in 1903 by Emil Oberhoffer and Elbert L. Carpenter. Oberhoffer was its first conductor and continued until 1921. By this time the orchestra had become nationally known and was famous for its annual tours which started around 1910. After Oberhoffer's retirement the orchestra was led for two seasons by guest conductors until the appointment in 1923 of Henri Verbrugghen. He in turn was succeeded by Eugene Ormandy who conducted the orchestra from 1931 to 1935. Following another season of guest conductors, Dimitri Mitropoulos was permanent conductor from 1936 to 1949, when he was succeeded by Antal Dorati. In its programs and performance the organization ranks as one of the leading orchestras of the United States.

MINNEHAHA, mīn-ě-hā'hā, Falls of (Sioux, *Mini-haha*, curling water), a cascade in the Minnehaha River, now in the Minnehaha Park, which belongs to Minneapolis, Minn. The cascade has a fall of about 60 feet and is in a picturesque glen which extends to the Mississippi River. Just below the falls the river is spanned by a rustic bridge. The name has become world-known through Longfellow's *The Song of Hiawatha*.

MINNESINGER, mīn'ě-sīng-ēr, or **MINNESANGER** (from the German *minne*, "love"), is the name given to the knightly poets and singers in Germany who were counterparts of the French Troubadours and Trouvères (q.v.). The Minnesinger flourished chiefly in the 12th and 13th centuries, and they were the leading representatives of German music during the Middle Ages. Strictly speaking, the name of the Minnesinger indicates that their songs were concerned exclusively with love, but actually the words of the *Minnesang* embodies the entire literature of German lyric poetry of the 12th and 13th centuries, dealing not only with the chivalric love of a knight for his lady, but also with religion and with political matters. The influences that shaped the songs of the Minnesinger were varied. The idea of knightly love came from Provençal literature; the sacred elements show a Gregorian background; and the erotic phases of medieval Latin poetry add a secular note. The result was a fusion of Christian spiritualism, with its ascetic spirit of self-denial and a secular-eroticism. The

Minnesinger themselves sang their own compositions, even though some of them were ignorant of musical notation.

While there is a close relationship between the Minnesinger and the Troubadours, the songs of the Minnesinger differ materially from those of the Troubadours and the Trouvères. The songs of the Minnesinger are, with a few exceptions, more of a narrative type, and often devotional. Some of them are songs to the Virgin. Musically the songs are closer to the ecclesiastical modes than the French melodies. Also, the musical notation of the *Minnesang* was similar to that then used in the Church. The fusion of ecclesiastic and secular elements resulted in the songs of the people becoming known in the courts, and in the songs of the Church and of the aristocracy becoming known to the people.

Modern music-lovers know of the Minnesinger chiefly through the music-dramas of Richard Wagner. Tannhauser was an actual Minnesinger who lived from 1205 to 1270, as were two other characters in the opera *Tannhauser*—Walther von der Vogelweide (c. 1170–1230) and Wolfram von Eschenbach (fl. 1200–1220). The last named composed an epic poem called *Parzival*, which was the basis for Wagner's *Parsifal* and part of *Lohengrin*. Even though Wolfram was one of the greatest of the Minnesinger, he was never proficient at writing and found it necessary to dictate his *Parzival* to a scribe. Walther von der Vogelweide was a lyrical genius whose place in German literature has been compared to that of Goethe. He himself belonged to the nobility, but his writings combined the art of the wandering minstrel and of the knightly poet-musician. Thus he mixed the popular and the aristocratic elements of his day, and as he wandered from court to court singing his own poems, which were set to music he had himself composed, he united the elements of German folk song and the artistic song of the Minnesinger. During the latter years of Walther's life, the art of the Minnesinger began to deteriorate, and in the hands of the later Minnesinger, the songs descended to trivial and unpoetic themes. By the 14th century feudalism had passed its prime, and there was less taste for poetry and music at court. Power passed from the hands of princes, nobles and prelates, and passed to the burghers and artisans, who became known as Meistersingers (q.v.).

Others of the Minnesinger include the following: Neithart von Reuenthal (c. 1180–1240), Bruder Wirner, Meister Alexander, Konrad von Wurzburg, Heinrich von Meissen (d. 1318), Wizlav von Rugen, Hermann der Damen, Friedrich von Hausen, Hugo von Salza, Heinrich von Morungen, Heinrich von Rugge, and Ulrich von Gutenberg. Many of the Minnesongs are preserved in medieval manuscripts. A number of them were said to have been collected by Rudiger Manesse (d. 1325) and his son, who gathered them into the Great Heidelberg Manuscript. During the Thirty Years' War this manuscript was taken to Paris, but was later returned to Heidelberg. In the 19th Century the contents of this manuscript were published by von der Hagen in Leipzig (1838), by Pfaff in Heidelberg (1899), and by Mathieu in Paris (1850).

Bibliography.—Villari, L., *Oswald von Wolkenstein; A Memoir of the last Minnesinger of Tyrol* (London

and Meistersingers, (Leipzig, 1805); Lachmann, R., *Minnesangs Frühling* (Leipzig, 1884); Haupt, M., *Minnesangs Frühling* (Leipzig, 1884);

MINNESONG (German *Minnesang*, *Minnesang*, from *minne*, love, and *sang*, song), a medieval type of German love-lyric, written chiefly by knightly poets in the 12th, 13th and 14th centuries, in the Middle High German dialect. The earliest of the 300 or more names of Minnesinger that have been preserved are Kürnberger, Memlo von Sevelingen, and Dietmar von Aist, but only about 160 of them have left poems that are still accessible. Some groups of Minnesinger were very distinctly under the influence of French (Provençal) and Italian models, such as Friedrich von Hausen, Rudolf von Feins, Ulrich von Gutenberg, Heinrich von Rugge and von Morungen, etc. The flower of the type blossomed in Walther von der Vogelweide and Reinmar von Hagenau about the year 1200, coincident with the great medieval German epic, the *Nibelungenlied*. Most of these songs were intended for musical performance and are divided into classes, distinguished by the names *lied*, *leich* and *spruch*. Rüdiger Manesse (d. Zürich 1325) and his son are said to have collected them in the Great Heidelberg Manuscript, which was taken to Paris in the course of the Thirty Years' War, and later returned to Heidelberg. It contains 137 miniatures and over 7,000 strophes; published by von der Hagen (Leipzig 1838), Pfaff (Heidelberg 1899), Mathieu (Paris 1850). But many poems not in the Manesse manuscript are found in other manuscripts. Later Minnesinger, such as Ulrich von Lichtenstein, began to regard the occupation of producing such poems as a sort of sport or handicraft and the art passed out of the hands of the lower nobility into those of the burgher "masters" (see *MEISTERSINGERS*) and roaming minstrels. Consult Lyon, O., *Minnesang und Meistergesang* (Leipzig 1883); Lachmann, K., and Haupt, M., *Minnesangs Frühling* (Leipzig 1884); Grimme, F., *Geschichte der Minnesinger* (Paderborn 1897).

JACOB WITTMER HARTMANN.

MINNESOTA, mīn-ě-sŏ'tā, one of the West North Central states of the United States. It is bounded on the east by Wisconsin and Lake Superior, on the north by the Canadian provinces

State flag.

of Ontario and Manitoba, on the west by North and South Dakota, and on the south by Iowa. The name of the state was derived from the

Dakota Indian words meaning "sky-tinted water."

Land area	80,009 square miles
Water area	4,059 square miles
Total area	84,068 square miles
Latitude	43° 34'—49° 23' N.
Longitude	89° 34'—97° 12' W.
Altitude	602 to 2,230 feet
Population (1940)	2,792,300
Population (1950)	2,982,483
Capital city—St. Paul; Pop. (1950)	311,349
Admitted as a state	May 11, 1858
Bird (unofficial)	American goldfinch
Flower	Pink-and-white moccasin flower, adopted February 1902
Motto	<i>L'Etoile du Nord</i> (Star of the North)
Nicknames	Gopher State, North Star State, Bread-and-Butter State, Land of Sky-Blue Waters, Land of Ten Thousand Lakes, Theater of Seasons
Song	<i>Hail! Minnesota</i> , adopted April 1941
Tree	Norwegian pine, adopted 1953

The state motto, "Star of the North," points up the fact that Minnesota includes the northernmost point of land in the United States: the Northwest Angle lying to the west of Lake of the Woods.

State seal.

Physical Characteristics.—Topography.

Rocks of practically every geologic age are to be found within Minnesota's borders, but its surface features are chiefly the handiwork of four great glaciers that one after another covered all but the southeastern tip of the state. These glaciers carried with them large quantities of rock fragments. In the northeast their scouring action exposed rock outcroppings in some places and in others scooped out great hollows that became the border lakes. Then, as the ice sheets melted, they dropped their burden of boulders, pebbles, sand, and clay in a jumbled mixture called drift. This was deposited in hilly moraines interspersed with more level stretches, both dotted with thousands of small pockets or basins that filled with water to become lakes.

The last of the rivers of ice dammed the outlet of the Red River basin, and when it melted it formed a huge lake 700 miles long and some 200 miles wide—called Lake Agassiz by the geologists. As the ice receded, Lake Agassiz drained away to the north but left behind traces of its lowering beach lines in many ridges of sand and gravel. Glacial Lake Agassiz was finally reduced to the size of Lake Winnipeg, and its level, fertile bottom became the valley of the Red River of the North.

Especially important is the fact that in north central Minnesota the old Laurentian highland survives as a divide from which originate three of the continent's great river systems: one draining northward through the Red River to Hudson Bay, one eastward by way of the Great Lakes and the St. Lawrence River to the Atlantic

Ocean, and one southward by way of the Mississippi River to the Gulf of Mexico.

Climate.—Minnesota is subject to great and sudden fluctuations of weather. The mean annual temperature is 44°F. The winters are often severe, marked at times and in places by extremes far below zero. The summers are characterized by rapid changes and occasional intense heat waves. Temperatures in some counties may range from 35° below zero to 108° above. January is the coldest month, July the hottest.

The growing season is longest, 160 days, in the south central and southeastern sections; in the northern counties it is much shorter, in some places only 100 days, but there long hours of summer daylight tend to offset the short season. Rainfall varies from an average of 32 inches along the central and southeastern boundary to as little as 20 inches in the northwestern prairies. In most of the state the prevailing winds are from the northwest.

In the early decades of its history, Minnesota's hyperborean climate threatened to discourage settlement, but the enterprising residents made a virtue of the cold, and boldly advertised the therapeutic properties of their "pure and invigorating air." For many years Minnesota was the number-one health resort of the nation, vying successfully with Florida for the attention of sufferers from tuberculosis, malaria, and ague. In the 1930's and 1940's, Minnesotans were again making their severe winter an asset, cultivating its advantages for winter sports as an attraction for tourists.

Rivers and Lakes.—Minnesota is exceptionally well watered. Explorers and trappers found its network of rivers and lakes excellent highways for their canoes, and the early settlers stayed close to the same water highways until railroads came to break paths into the interior. The development of lumbering and flour milling would have been much delayed without the many water-courses to provide power for the mill wheels, and transportation from forest to sawmill for the logs. Later generations make equally good use of the state's waters for recreation in fishing, swimming, and canoeing.

Each of the larger rivers is fed by numerous good-sized tributaries: the Mississippi by the Crow Wing, Rum, Minnesota, St. Croix, Cannon, Zumbro, and Root; the Minnesota by the Blue Earth, Cottonwood, Redwood, Chippewa, Pomme le Terre, and Lac qui Parle; the Red by the Red Lake and Wild Rice; the Rainy by the Vermilion, Big Fork, and Little Fork; the St. Croix by the Little and the Snake. All these tributaries lie wholly within the state.

The exact number of Minnesota's lakes is undetermined, but there are at least a thousand more than the 10,000 of legend and slogan. They range in size from a few acres to the 440 square miles of Red Lake and the 200 square miles each of Leech and Mille Lacs. Perhaps the most famous is Lake Itasca, principal source of the Mississippi River. The best and longest known as a fashionable resort is storied Lake Minnetonka near the Twin Cities. Within the city limits of St. Paul and Minneapolis are 13 lakes of notable size and excellent beaches.

Political Divisions.—*Cities.*—Minnesota is predominantly an agricultural state, and though its population in 1950 was 54.5 per cent urban, few of its cities are large. Only three cities have populations of over 100,000; three others

of over 25,000; and 17 others of over 10,000.

The cities of St. Paul and Minneapolis, with Anoka, Dakota, Hennepin, and Ramsey counties, make up Minnesota's most important metropolitan area, which in 1950 had an estimated population of 1,107,366. The intense rivalry of early years between these twin cities on the Mississippi declined as the two grew physically into one so completely that the visitor and often the resident cannot tell when he leaves the one and enters the other. The two remain distinct, however, in government, economic activities, and general characteristics. St. Paul, in addition to being the seat of the state government, has become predominantly a commercial and jobbing center, Minneapolis a financial, transportation, and manufacturing center. Together the two cities constitute the cultural as well as the economic capital of a vast upper midwest hinterland.

Duluth is their nearest rival, physically and economically. Founded on lumbering, its real growth came with the development of iron mining. Because of its strategic site at the head of the Great Lakes, it became a great shipping center, sending out from the docks in its lake harbor tons and tons of ore and grain, and receiving back heavy cargoes of coal and other bulky commodities. As a corollary of this activity, it has developed a considerable list of manufactures and become a distributing center for a wide area reaching westward into the Dakotas.

Several of the smaller cities also have special distinctions. For example, Rochester as the home of the Mayo Clinic and Foundation is a world famous medical center; South St. Paul and Austin are nationally known meat-packing centers; Cloquet and International Falls specialize in the making of paper and other wood products; Red Wing manufactures pottery from Minnesota clays; Brainerd makes a lucrative business of being the gateway to the "Paul Bunyan country" for tourists; Northfield is a college town, the seat of both St. Olaf College and Carleton College; St. Cloud is well known to American architects for the fine granite it quarries. On the whole, however, most Minnesota cities are "agricultural service stations," centers of trade for the farming areas immediately surrounding them. For population of cities and towns, see back of state map.

Counties.—Minnesota's 87 counties vary widely in population and size. Fifty-seven of them were organized before statehood, 21 more before 1879, and the remaining 9, all in the timbered areas of the far north, were added by executive proclamation thereafter.

County	County Seat	County	County Seat
Aitkin	Aitkin	Douglas	Alexandria
Anoka	Anoka	Faribault	Blue Earth
Becker	Detroit Lakes	Fillmore	Preston
Beltrami	Bemidji	Freeborn	Albert Lea
Benton	Foley	Goodhue	Red Wing

Pope	Glenwood	Wright	Buffalo
Ramsey	St. Paul	Yellow Medicine	
Red Lake	Red Lake Falls		Granite Falls

The People.—Origins.—Minnesota's population, even more than that of most American states, is a mixture of peoples, chiefly from Europe. Its percentage of foreign born to total population has been consistently higher than that for the United States as a whole.

The earliest inhabitants of the Minnesota country were, of course, Indians, of two tribes: the Sioux or Dakota, and the Chippewa or Ojibway. Some 15,000 descendants of these tribesmen still live on reservations in Minnesota. The scattered earliest settlers included French, English, Scotch, Swiss, and French Canadians. But when settlement began in earnest, the first wave was made up chiefly of native Americans moving westward. It was these who gave the state's institutions and folkways their characteristic stamp, for the overseas immigrants who followed did their best to discard their own language, costumes, and customs for the ways of the earlier Americans.

Needing more people to work in the logging camps and lumber mills and to clear and till the fertile land, the enterprising early settlers reached out to sell the idea of Minnesota, through personal agents and glowing campaign literature, to the oppressed, ambitious, and discontented of Europe. The first rush of immigration in response was made up principally of Germans, Irish, Norwegians, and Swedes. By 1890, there were 460,000 foreign born living in Minnesota, and, of these, all but 30,000 were Germans, Scandinavians, or immigrants from English-speaking countries. The Scandinavians alone made up 215,000 of the number. Nonetheless, Germany continued to lead all nations in the numbers sent to Minnesota until 1910; then Sweden took first place.

During the 1880's and 1890's the earlier trickle of Czechs, Slovaks, and Poles became a good-sized stream; now the iron mines as well as the lumber industry needed laborers. The Finns, however, soon became the largest group in this so-called new immigration, and by 1930 there were 60,000 of them in the state. Also, in smaller numbers, came Slovenes, Russians, Icelanders, Italians, and Greeks. The latest comers included Mexicans who came to work in the sugar beet fields and Japanese Americans relocated from the west coast during World War II. In 1940 there were 9,928 Negroes in Minnesota, 8,785 of whom lived in Minneapolis and St. Paul.

Population Trends.—Throughout the 19th century the growth of the state's population was phenomenally rapid. In the census of 1850, Minnesota Territory, much larger than the later state, reported 6,077 residents. In 1860, two years after Minnesota became a state, her people numbered 172,023. The greatest growth occurred between 1880 and 1890, and thereafter, though the population mounted with every census, the increases became progressively smaller. In 1940 the population was 2,792,300—a density of 34.9 inhabitants per square mile. But by that time the population growth had come almost to a halt. In fact, reliable estimates indicated a loss of 10.6 per cent between 1940 and 1945. Although this was undoubtedly due to the drain of manpower for World War II, all the evidence pointed to Minnesota's having reached a stabilized population.

Three trends had become especially evident:

- (1) The movement of persons within the state was from the farms to the cities. From 1900 to 1940, the rural population increased from 1,153,000 to 1,400,000—a gain of some 20 per cent. But during the same period the urban population grew from 598,000 to 1,390,000—a gain of more than 130 per cent. Much of this urban growth came from the movement of rural residents to the cities.
- (2) The smaller cities were growing more rapidly than the larger. From 1910 to 1940, the three cities of the first class increased 50 per cent, whereas in the same period the smaller urban centers almost doubled in population.
- (3) The age level of the population was rising. In 1860, 70 per cent of the people were less than 30 years of age; in 1940, only 51 per cent were under that age.

Famous Men and Women.—Many Minnesotans (by birth or residence) have achieved national distinction in their professions or other activities. Among those famous enough to be known outside their special fields are these:

Politics and government: Ignatius Donnelly (Philadelphia, Pa., 1831–1901), political crusader and philosopher; John Albert Johnson (St. Peter, 1861–1909), Floyd B. Olson (Minneapolis, 1891–1936), and Harold Edward Stassen (Twin Cities, 1907–), governors; Frank Billings Kellogg (Potsdam, N. Y., 1856–1937), secretary of state under President Coolidge. **Business and industry:** John Sargent Pillsbury (Sutton, N. H., 1828–1901), Charles Alfred Pillsbury (Warner, N. H., 1842–1899), Cadwallader Colden Washburn (Livermore, Me., 1818–1882), and John Crosby (Hampden, Me., 1829–1887) in flour milling; Frederick Weyerhaeuser (Germany, 1834–1914) in lumbering; James Jerome Hill (Rockwood, Can., 1838–1916) in railroad building, and Charles Augustus Lindbergh (Detroit, 1902–) in aviation. **The professions:** William J. Mayo (Le Sueur, Minn., 1861–1939) and Charles H. Mayo (Rochester, Minn., 1865–1939), surgeons; Lotus Delta Coffman (Salem, Ind., 1875–1938) and George Edgar Vincent (Rockford, Ill., 1864–1941), university presidents; Thorstein Bunde Veblen (Cato tp., Wis., 1857–1929), economist and philosopher. **Arts and letters:** Sinclair Lewis (Sauk Centre, 1885–), F. Scott Fitzgerald (St. Paul, 1896–1940), and Ole Edvart Rølvaag (Norway, 1876–1931), novelists; Cameron Booth (Erie, Pa., 1892–), Adolf Arthur Dehn (Waterville, Minn., 1895–), and Dewey Albinson (Minneapolis, 1898–), painters; Paul Manship (St. Paul, 1885–), sculptor; Cass Gilbert (Zanesville, Ohio, 1859–1934), ar-

Natural Resources.—Animals.—Before the coming of the white man, buffalo and antelope roamed the western prairies in herds so large they were said to stretch "as far as the eye can see." Killed for their meat and skins, and deprived of their habitat for settlement, they have wholly disappeared from the state. The northern evergreen forests were in pioneer times full of elk, moose, and caribou. Now only a few hundred moose and from 30 to 40 head of caribou are left, and they have withdrawn into wilderness swamps far to the north. The white-tailed deer is the commonest of the big game remaining, originally it lived in the southern hardwoods, but now makes its home chiefly in the second-growth forests of the northern counties. The species is abundant, despite the thousands killed during the hunting season each year. Black bear is fairly numerous, and the beaver are multiplying rapidly under rigid protection, though they had been so extensively trapped as to be in danger of extinction. Even the prolific muskrat had to be protected for a time. Muskrat, marten, mink, and mink are trapped, and mink and red, silver, and black fox are bred on farms, for their pelts.

The shallow lakes and marshes of the northern counties make good feeding and breeding grounds for waterfowl, and 25 species of ducks and 4 of geese are found in Minnesota waters. There is also a fair abundance of partridge, sharp-shinned grouse, and the ring-necked pheasant. But the passenger pigeons, once so numerous that their flight darkened the sun like a cloud, have all been killed off.

Good fish of many kinds reward fishermen. The muskellunge is the largest of Minnesota fish, but more common are walleyed and northern pike, large- and small-mouth bass, brook and rainbow trout, crappies, perch, sunfish, bluegills, and whitefish. The supply is well maintained in spite of the enormous catch made every year. State hatcheries stock the lakes and streams with millions of fry and fingerlings yearly.

Plants.—The original vegetation was of three broad types: prairie grasses to the west and northwest, coniferous forest to the north and northeast, and a broad diagonal band of deciduous hardwoods in between. The prairies were treeless except along the rivers. There in the bottomlands still grow the willows and cottonwoods, and, on the higher banks, the box elder and sugar maple. Along the streams in the southern counties the thickets include wild plum and cherry trees festooned with grape vines and sheltering small fruits and other shrubs. Scattered over the prairies are wild strawberries, and in any forest openings blueberries and cranberries are plentiful enough to be economically valuable. In the earliest spring the pasqueflower and the anemone appear on the prairies. Violets, columbines, woodruffs, geraniums, buffalo beans, wild roses, and pond lilies, and sunflowers follow through the summer, and asters bloom until the first frost. Marshes shelter the fringed gentian, several kinds of ladyslipper, marigolds, and gold-rod in 36 varieties. Clovers, persistent and widespread, have fostered the development of haymaking, and many varieties of grasses, especially

alfalfa, have been introduced to supplement them for forage.

Forests.—The most important of Minnesota's plant resources was the timber that at one time covered more than two thirds of the state. In the hardwood zone the trees were principally sugar maple, basswood, white and slippery elm, red and green ash, butternut, and bur and white oak, with tamarack and black spruce in swamp openings. In the southeast black oak, black walnut, and river birch were added to the northern species. Little of this beautiful forest remains except along the rivers and in small farm woodlots. Its trees were cut to clear land for farming and its lovely undercover was grazed off or plowed under.

Much more valuable commercially were the great coniferous forests that covered the entire northern half of the state as far west as the Red River Valley. They accounted for most of Minnesota's 38 million acres of virgin timber. Including some hardwoods, the species that composed this wooded expanse were white, Norway, and jack pine, white and black spruce, tamarack, cedar, balsam, yellow and paper birch, aspen, balsam of Gilead, green and black ash, basswood, elm, red and hard maple, ironwood, and pin cherry. The white and Norway pine, the species on which the lumber industry depended, occurred on the better soils in mixed stands that yielded from 20,000 to 60,000 board feet of lumber per acre.

Thanks to unrestricted logging and to devastating forest fires, only about half this original expanse remains forested, and in that half little is left of the virgin timber. The present forest consists of what foresters call fire species—jack pine, white birch, aspen, and pin cherry—because they return more quickly than others in a burned area. Only small and scattered remnants of timber of sawlog size remain. Much of the reproduction has not yet attained a merchantable stage, and what has is second growth of cordwood size.

Soil.—The prevailing soil is a black loam underlaid with clay. This soil is deep and rich in the southern part of the state and in the Red River Valley. It is somewhat shallower and sandier in the belt that skirts the pine woods, and quite sandy in the northeastern counties. The heavy soil produces all the varieties of grains and grasses, and on the sandier soils can be grown clovers and potatoes, vegetables and fruit. In the northern counties there are many large stretches of peat bog and muskeg swamp that are unfit for agriculture. About the time of World War I extensive tiling and ditching operations were undertaken to drain these areas and turn them into farms, but state officials soon had to give up the project because of its disastrous effects in lowering water levels, reducing wildlife, and increasing fire hazards. Much of the hopelessly rocky land of the northeastern counties is being reserved for reforestation and recreation.

Minerals.—Beginning in the 1880's, concentrated deposits of some of the richest iron ores on earth were located in three Minnesota ranges: the Vermilion range in northern St. Louis and Lake counties, the Mesabi range in St. Louis and Itasca counties, and the Cuyuna range in Aitkin, Crow Wing, and Morrison counties.

The deposits on the Vermilion range are hard ores, occurring in pockets or veins so complexly patterned that in spite of extensive exploration it is not certain all the pockets have been found.

They lie deep in the earth and can be mined only through vertical shafts and underground tunnels. The Mesabi ores are soft and lie near the surface in broad horizontal beds. To mine them it is necessary only to strip off the thin layer of glacial drift that covers them, then scoop out the ore with steam shovels and load it directly into waiting railroad cars. The Cuyuna ores are both hard and soft and contain manganese, an important element in steel making. They are mined by both the open-pit and underground shaft methods.

In 1947, it was estimated that at least a billion tons of high-grade ore remained to be mined in these three ranges, although a billion and a half tons had already been taken from them. The quantity of low-grade ores not merchantable without special treatment was estimated to exceed 30 billion tons.

Minnesota also has rich deposits of granite, limestone, sandstone, jasper, travertine, mica, and feldspar. Its deep beds of sand are used in making glass, its peats for insulation and packing materials, and its clay, sand, and gravel for tile and brick making, concrete work, and road building. Several of its clays are good for pottery manufacture. But the state has no deposits of precious metals, no coal, gas, or oil, and not enough waterpower for any considerable hydroelectric development. Its own peat beds and the lignite of North Dakota offer the only promise of fuel resources near at hand.

Conservation.—Minnesota's natural resources were so plentiful that the idea of any need to conserve them never entered the minds of the pioneer settlers. They accepted as fact the "legend of inexhaustibility" that underlay the ruthless logging of the pinelands, the mining of the soil's fertility, and the wanton slaughter of game and fish. The few men who foresaw an end to the days of plenty were unheeded voices until well toward the end of the 19th century.

Real efforts toward conservation began in the 1890's and a good deal was accomplished during the next three decades, though action was sporadic and haphazard. Not until the legislature in 1931 established a state department of conservation were systematic and organized measures undertaken for planning the wise and effective use of the state's natural resources. This department includes divisions for forestry, game and fish, lands and minerals, and water resources.

Some of the newer conservation problems the state has come to recognize are (1) guarding against soil erosion, (2) conserving the waters that tend always to flow out from Minnesota's natural divide, and (3) finding ways of making salable the vast quantities of low-grade ores in the iron ranges.

Parks, Forests, and Reservations.—**Parks.** An important part of the conservation movement was the setting up of a system of state parks and forests. The original purpose was to preserve trees and provide a cover for wildlife, but recreational values came quickly to the fore when the automobile made the reserved areas readily accessible. The first state park, Itasca, was set aside in 1891. By 1947, Minnesota had 57 such parks, "waysides," and "recreational reserves." Their combined areas totaled 83,372 acres, with a property replacement value of more than 6 million dollars.

Forests.—More than half of the state forests have been set aside since 1931, though the first

one, Pillsbury State Forest, was established in 1899. In 1947, there were 32 of these forest reserves scattered through the northern two thirds of the state. Their combined area was 5,332,040 acres, of which some 2 million acres were state-owned. In addition there are two national reserves in Minnesota, the Chippewa National Forest and the Superior-Quetico National Forest, with a combined area of nearly 2 million acres.

Indian Reservations.—The two principal Indian reservations in Minnesota are at White Earth and Red Lake. The Red Lake Reservation is as nearly untouched by civilization as any area in the state, but White Earth is a reservation in little but name, most of the Indians having sold their land allotments, which the government mistakenly made transferable.

Other Points of Interest.—Both Bemidji and Brainerd are towns of unusual interest because of their association with the many stories of Paul Bunyan. Around Bemidji are the forests and lakes of the Paul Bunyan Playground, and on the shores of Lake Bemidji are the gigantic statues of Paul Bunyan and his blue ox, Babe. In both towns carnivals are held annually in his honor.

The Pipestone National Monument, established by Congress in 1937, in the southwestern corner of the state, is a 115.60-acre tract in which are situated the famous pipestone quarries. Indians have always considered this spot sacred and their peace pipes were made from the red pipestone or catlinite. Longfellow refers to this region in his poem *Hiawatha*.

A winter carnival is held annually in St. Paul at the end of January. For nine days there are parades, snow floats, and fireworks. A huge medieval ice palace is built in Como Park out of 4,500 tons or more of ice. The first winter carnival was held there in 1886.

Industries.—**Agriculture.**—Farming has been Minnesota's chief industry since 1850. From 1840 to 1880 wheat was virtually the sole farm crop throughout the state, and in the Red River valley the famous "bonanza" farms, thousands of acres each, became literally farm factories, using the new agricultural machinery and producing wheat in the millions of bushels. But one-crop farming exhausted the soil quickly, and the farmers, relying on a single crop for their income, were peculiarly at the mercy of nature and of fluctuations in the wheat market. Gradually, therefore, they were persuaded to diversify their product. By 1900 corn had pushed into first place, and in 1945 less than 10 per cent of the farm acreage was occupied by wheat.

Minnesota has become predominantly a livestock and dairying state. Much of the corn and grain it produces is fed to livestock and sold in the form of pork, beef, mutton, wool, poultry, and eggs. Great improvements in livestock breeding contributed to this development. Also, better forage crops and better breeds of milch cattle, added to improvements in mechanized equipment in transportation and refrigeration, and in methods of packaging and marketing, made Minnesota in 1939 the leading state of the nation in butter production. It led the states also in the production of oats and clover seed; it ranked second in milk and milk powder, poultry and poultry products, and flax; it was fourth in corn, fifth in rye, and seventh in alfalfa and barley. It grows substantial crops also of potatoes, apples, strawberries, raspberries, plums, and vegetables of all kinds. From 1940 to 1945 its production of sor-

beans rose from 465,000 bushels to 3,741,000 bushels—a gain of 800 per cent.

In 1940, Minnesota's farm plant included 32,606,962 acres, broken into 197,351 individual farms, averaging 165.2 acres, with a recorded value of $1\frac{1}{2}$ billion dollars and a gross annual income of 360 million dollars. These figures increased phenomenally in the next few years; for instance, from 1940 to 1947 farm income rose 133 per cent. But such increases were due to the demands of World War II and were probably not to be maintained.

The major problems of Minnesota agriculture at mid-century were three: (1) Soil erosion, especially on the level plains and prairies in the west and in the hilly terrain of the southeastern counties. Conservation experts were trying to teach farmers to use contour plowing and strip farming to reduce this hazard. (2) The farming of lands unsuited to cultivation. In 1940, 30,881 of Minnesota's farms had a sales and consumption total product averaging less than \$400 per farm. The state was working to relocate the owners of these subsistence farms on more productive lands and to reforest the submarginal areas. (3) The increasing export of farm products. In 1910, one half the total product was used within the state, either for consumption or for manufacturing, but by 1940 only one third was so used. Since raw materials from Minnesota farms suffer the handicap of high transportation costs in national and international competition, state leaders were urging the development of more manufactures to process farm products within the state.

Flour Milling.—The early emphasis on wheat growing made flour milling a natural development, but there was an obstacle. The hard spring wheat of the area was of excellent quality, but because the bran coat of the grain was peculiarly brittle, the flour made from it was dark and speckled. Successful competition in the export market demanded a solution of this problem. Finally a device called the middlings purifier was developed to blow the bran specks from the flour, and this, together with the installation of rollers instead of the old millstones for grinding, sent Minnesota mills, most of them in Minneapolis, forging ahead of all competitors. By 1895, Minnesota flour was acknowledged to be the best made, flour was the state's leading manufactured product, and Minneapolis was the world's foremost milling center. The mills continued to increase their output to a peak of 29,389,889 barrels in 1916. Their advertising slogans, such as "Eventually, Why Not Now" of Gold Medal flour and the answering "Because Pillsbury's Best" became household words, as did the names of the many breakfast foods and other cereal items they added to their list of products.

But after 1916 the Minnesota mills gradually lost their pre-eminence, owing to a combination of several adverse factors: unfavorable freight rates, decline in the production of wheat, decline in the per capita consumption of wheat, and the rise of other milling centers nearer to eastern markets and to more productive sources of wheat. The 324 mills of 1900 declined to 81 in 1940, and the output decreased to 11,153,594 barrels. Nevertheless, flour milling still ranked fifth among Minnesota's manufacturing industries, and Minneapolis stood next to Buffalo and Kansas City as a national milling center.

Even in their heyday Minnesota's mills could

not handle all the wheat as it poured from the fields at harvest time. Consequently, elevators for storage of the grain were built at every railroad station. At first these were square wooden structures painted red, but they evolved into the massive clusters of towering cement pillars that are a distinctive feature of a Minnesota skyline and one of the state's acknowledged contributions to original and functional architecture in America.

Meat Packing.—With the diversification of agriculture and the rise of livestock raising, meat packing superseded flour milling as the state's biggest single manufacturing industry. When Minnesota farmers began exporting livestock, South St. Paul, where the lines of six railroads converged, became a watering place for animals being shipped to Chicago. In 1888, the railroads combined to build a union stockyard at the Minnesota town and a number of national packing firms promptly established branch plants nearby. From this beginning South St. Paul rose to be the third largest packing center in the nation. Austin is its nearest rival within the state.

Lumbering.—Logging and milling began in the St. Croix Valley in 1839 and a little later in the valleys of the Mississippi and the Rum. It then moved northward as the stands of uncut white and Norway pine receded. Methods of both logging and milling at first were crude and slow, depending on the brawn and skill of experienced lumbermen from Maine and Canada and on waterways for transportation and power. But with the coming of railroads, the extension of settlement, and the consequent expansion of the market, new machinery, techniques, and forms of power were introduced and lumbering became big business. At its height in Minnesota, about 1900, the industry produced $2\frac{1}{2}$ billion board feet of lumber a year, and Minneapolis was the leading lumber milling center of the world. But the pine on which the industry was based was rapidly being exhausted, as it had been earlier in Maine, Michigan, and Wisconsin, and the industry declined rapidly. In the second decade of the century mill after mill closed its doors until only a few small ones far up on the northern border were left. By 1940, the annual cut had dwindled to 111 million feet, and Minnesota, far from supplying a major portion of the national demand for lumber, was importing the bulk of its own needs from the Pacific coast.

Nonetheless, Minnesota's forests remain one of its major resources. Science and technology have made the "weed trees" or "fire types" that grow from around the stumps and amid the ashes of departed pines into useful industrial materials. Among the products from this later forest are pulpwood as a raw material for the making of paper, rayon, and plastics, cedar poles and fence posts, mine timbers, piling, railroad ties, cooperage logs, match and clothespin bolts, lath and shingle stock, and, of course, firewood.

It was assumed during the golden age of the lumber industry that once the stumps had been cleared from the cutover lands, they would make productive farms. This assumption proved unfounded. During the 1930's almost 7 million acres of land in northeastern Minnesota became tax delinquent and, by 1940, some 5 million of these acres had been forfeited to the state, creating serious tax and relief problems for the counties in which they lay.

Iron Mining.—Since 1890, Minnesota's iron ore has been the backbone of the nation's heavy

industry, vitally important in peacetime and indispensable in time of war. By 1945, the mines had fed 1½ billion tons of ore into eastern smelting furnaces and steel mills. Before World War II, the annual output of the mines was between 40 and 50 million tons. During the war years production jumped to an annual average of 66 million tons, with peak shipments in 1942 of 75 million tons, almost 70 per cent of the national total.

Minnesota's advantage over other iron mining areas has lain in the richness of its deposits of ore that can be shipped directly from mine to furnace or mill. These are nearing depletion. Lower grade ores require some degree of beneficiation, that is, treatment by one or more methods—washing, crushing, screening, jigging, drying, sintering, and magnetic concentration—to remove impurities so as to achieve the 50 per cent or more of iron content demanded by the steel mills. By the end of the 1930's as much as 40 per cent of the output from Minnesota's mines had to be beneficiated before shipment. In 1945, it was estimated that at the prewar level of mining, the merchantable ores (direct-shipping ores and those requiring minor beneficiation) might last from 35 to 40 years longer, but that if the wartime rate of removal continued they could hardly last longer than 15 years. Against this eventuality a number of state agencies, as well as the mining companies themselves, were making heroic efforts to lower the costs of beneficiation and also to find ways of rendering the very low-grade taconite ores merchantable.

The iron mines are a vital element in the state's economy. They have given rise to a sizable subsidiary transportation industry involving ore railroads, lake freighters, and special docks at Duluth and Two Harbors. Within a relatively small geographical area, some 25 urban communities owe their existence to the mines and depend upon them for revenue. Exercising their right to tax the mining properties for public improvements, these range towns have rapidly and lavishly provided themselves with fine community centers, public schools, parks, and public libraries. In some of the towns the mining companies pay 99 per cent of all taxes levied.

State and local taxes paid by the mining interests—including an ad valorem tax, an occupation tax on the ore mined, and a tax on all royalties paid for ore that is privately owned—were in the middle 1940's amounting to 21 million dollars a year. In addition, royalties from state-owned mines to the amount of 58 million dollars had been paid into the permanent trust funds of the state by 1945.

Quarrying.—Since 1880 Minnesota has ranked high among the states in the production of building stones, especially granite. St. Cloud stands second only to Barre, Vermont, as a granite-producing area. Many of the 40-odd varieties of Minnesota stones are standard names and materials well-known to American architects. Kasota limestone, Winona travertine, and Kettle River sandstone, for instance, have been used in the construction of hotels, state capitols, and business buildings the country over—some for the buildings proper, others, because of their beauty in color or texture, as decorative trims.

Recreation.—The business of providing for tourists was classed in 1945 by the resources commission as one of the state's more promising industries. It was bringing into the state each year

an estimated 1 million visitors, who spent for recreation and all their attendant needs an estimated 2 million dollars. Several agencies, including a state tourist bureau, were concerning themselves with the expansion of this profitable use of the state's recreational resources.

Geographical Position, an Economic Factor.—Industrially and commercially, Minnesota suffers a geographic handicap in its location a thousand miles from the Eastern seaboard and even more from the Pacific coast. Its goods must be shipped long distances to reach the nation's major markets and the high transportation costs are a serious disadvantage in competition with agriculture and industry nearer the big centers of population.

Historically the state's major market has extended westward. Minneapolis, St. Paul, and Duluth, all developed as distributing centers because they formed the gateway—the Twin Cities by river and railroad, Duluth via the Great Lakes—to vast regions of new settlement in western Minnesota, the Dakotas, and on into Montana. Homesteaders in these areas sent their wheat and livestock east to the Minnesota cities and in return bought their lumber, fuel, and manufactured goods from those cities. This flow of trade was furthered at first by the advancing railroads, but as these moved on across the continent and increased their network of feeder lines, they put the northern plains and prairies in touch with other centers and tended to lessen their dependence on Minnesota.

Nevertheless, the Twin Cities and Duluth remain the principal economic capitals of this northwestern empire, and its trade keeps Minnesota's wholesale sales substantially higher than its retail sales. Minneapolis and St. Paul are also the chief social and cultural center of the area. Conventions, ice and water carnivals, sports events, plays, symphony concerts, and grand opera seasons, all bring thousands of visitors to the two cities from hundreds of miles away. But the northern plains and prairies are, on the whole, sparsely peopled and their population tends to decline rather than expand. The promise of a new and enduring markets lies elsewhere.

Transportation and Communications.—**Railroads.**—Minnesota has done what it could about its handicap of distance. Its transportation system is of high caliber. Twenty-seven railroads operate within the state, of which 13 are Class I roads and 3 (the Milwaukee, Great Northern, and Northern Pacific) are transcontinental lines. These railroads web the state so well that no community, except in the forest lands, is more than ten miles from a rail line. In 1948, ten fast streamliners a day were providing superior passenger service between the Twin Cities and Chicago, and trains to the west were equally though not so many.

Water Transport.—Lake and river transportation, so vital in the early days, was again of increasing importance. The organization of the Federal Barge Lines in 1927 and the subsequent construction of a 9-foot channel with accompanying locks and dams in the upper Mississippi has restored the usefulness of the river for freight transportation during seven months each year. Commodities received in the Twin Cities via lake barge increased from 158,047 tons in 1935 to 2,047,143 tons in 1943. Shipping via the Great Lakes, though possible for only 228 days a year on the average, seemed the state's main hope for reducing freight costs to the East, and business

aders were working earnestly to promote federal government development of the proposed Great Lakes-St. Lawrence Waterway.

Airways.—Air transportation was becoming increasingly important in the 1940's and hopes were high that the Twin Cities might become a crossroads of international as well as national air traffic because of their strategic location on the northward, that is, the shortest air route to the Orient. In early 1948, Northwest and Capital Airlines together were providing a dozen direct flights daily to and from New York City and Washington, D.C. Flights to Chicago were scheduled two or three hours apart. Northwest Airlines also had daily nonstop flights to the Pacific coast, three flights a week to Alaska, and three a week to Tokyo and Shanghai. Flights to Manila were scheduled as needed and the company was inaugurating service to Honolulu. Service between points within the Mississippi Valley was provided, also, by Mid-Continent Airlines. This air traffic centered in Wold-Chamberlain field in the Twin Cities, but there were commercial airports also in several of the smaller cities. Though passenger service was paramount, air express was increasing. The freight carried by Northwest Airlines rose from 36 million pounds in 1935 to more than a billion pounds in 1944.

Highways.—The backbone of transportation within the state was (1948) its excellent system of highways. Of the 126,000 miles of road, some 5,000 were paved and improved state highways; the remainder were county roads, but the bulk of them were graveled or otherwise well surfaced. Thousands of trucks and buses conveyed freight and passengers along these roads. Minnesota was the birthplace of nationwide bus service. In 1914 a miner in Hibbing forsook his drills to start a trolley bus service between the town and the mine. Four years later he had organized a company, moved his headquarters to Duluth, and was running a fleet of 18 buses in northern Minnesota. From this beginning, by expansion, imitation, and merger grew the continental system of the Greyhound lines.

Radio.—In communications, besides good telephone and telegraph service and adequate newspaper coverage throughout the state, Minnesota had 21 radio stations in operation in 1947. Of these seven in the Twin Cities, two were 50,000-watt stations, two were offering FM broadcasts, and one had begun television. Each of the national networks was represented by one or more Minnesota stations.

Economic and Financial Factors.—**Labor relations.**—Until well into the 20th century, the supply of labor in Minnesota usually exceeded the demand. Thousands of migrant workers, pouring to the state every spring and fall looking for work, principally in the lumber camps and the sawmills, made Minneapolis for many years the outstanding migratory labor center in the country. With this advantage—in spite of the organization of a Minnesota Federation of Labor in 1900 and the subsequent proliferation of labor unions—employers were able to maintain the prevalence of the open shop until after 1934, when truck drivers of Minneapolis staged the most dramatic and effective of Minnesota's strikes.

Most of labor's gains in Minnesota, however, have been won through political action and the ballot box. The first law regulating working conditions in factories was passed in 1893; an effective child labor law followed in 1895; a work-

men's compensation act was finally secured in 1913; and in 1921 an industrial commission was set up to exercise state supervision and protection for labor.

Minnesota's Labor Relations Act of 1939 has won widespread national attention. Under its provisions, workers or employers must notify the state labor conciliator ten days in advance of any projected strike or lockout. He attempts to settle the dispute. If he fails, and if the issue involves an industry in which work stoppage would be detrimental to the public interest, he may refer the matter to the governor, who may then name a three-man fact-finding commission to investigate the matter and report its findings and recommendations to him within 30 days. During this period the strike or lockout must be delayed. This "cooling off" period is considered the crux of the law. Neither the conciliator nor the fact-finding commission has judicial or police powers, and their recommendations are not binding on either party to the dispute.

Until the conditions of World War II tended to standardize wage levels in the United States, Minnesota's labor costs were well below the national average. In 1936, wage rates were still 36 per cent below those paid by eastern manufacturers, but by 1945 they were only 7 per cent below, and Minnesota industry was losing an important advantage in competition for national markets.

Cooperatives.—Minnesota has long been a leader among the states in the strength and scope of its cooperative movement—partly perhaps because its Danish and Finnish settlers were schooled in cooperative principles and methods in Europe, and partly because sound management policies are enforced by state laws enacted to protect and encourage cooperatives.

Though the major cooperative associations are rural in membership and deal in agricultural products, the thousands of cooperatives, large and small, in operation in the state cover marketing, processing, and consumption in many fields—grain marketing, butter production, milk and oil distribution, wholesaling for small independent storekeepers, fire insurance, rural electrification, dry cleaning, book buying, and food buying, to name only a few. From 1935 to 1943, the volume of sales by Minnesota's marketing cooperatives rose from 123 million dollars to well over 336 million dollars.

Wealth and Income.—Per capita wealth in Minnesota, in relation to the national average, rose steadily to a peak in 1904, held fairly steady for 18 years, then took an abrupt slump. In 1904, the state's per capita wealth was 32 per cent above the national average. In 1922 it was still 22 per cent above, but by 1924 it had dropped to the national average. By 1932 it was 18 per cent below that average, and there it has tended to remain. This was interpreted by the Minnesota Resources Commission to mean that the state's relatively simple agrarian economy has put it at a disadvantage.

Banks and Banking.—Thanks largely to the high level of agricultural income, Minnesota bank deposits were at an all-time high in the late 1940's. A tabulation by the Federal Reserve Bank in early 1947 listed the accumulated savings in the state at \$3,530,322,087. At least half this amount was held by individuals, providing a sizable backlog for investment.

As of June 30, 1948, there were 943 state

financial institutions. Of these, 504 were state commercial, mutual savings, and private banks with total assets of \$1,059,802,000 and total deposits of \$992,636,000. The rest were loan companies, investment companies, credit unions, and the like.

To these were added, as of Dec. 31, 1948, 178 national banks operating within the state, with total assets of \$2,121,184,000, and total deposits amounting to \$1,979,662,000. Since 1914, Minneapolis has been the seat of the Ninth Federal Reserve District.

Government Finance.—From 1939 to 1943 the cost of carrying on the business of government in Minnesota was reduced from \$220,500,000 to \$198,000,000. Administration of the state government accounted for a relatively small part of these sums; most of the money was expended by 10,409 units of local government: counties, cities, villages, townships, and school districts. It was generally recognized that these local units were too many for efficient and economical operation, and there was considerable public support for the consolidation of townships and school districts and even, in some functions, of counties.

As of June 30, 1948, the state treasurer reported a total of \$201,864,362 in the permanent trust funds and other invested funds of the state; a cash balance in the general revenue fund of \$28,603,497; and a total cash balance in all funds of \$103,274,570. At the same time the indebtedness of the state totaled \$58,816,083.

Taxation.—In 1941, before the needs of World War II created an abnormal situation, Minnesota ranked twenty-first among the states with its per capita collection of \$68.64 in state and local taxes. The major sources of tax income were: property tax, iron ore, motor fuel, alcoholic beverages, motor vehicle licenses, income, and miscellaneous small taxes. There is no sales or poll tax.

Government.—*State.*—Among the distinctive features of government in Minnesota are the School Lands Law (see *Education*); the Labor Relations Act (see *Economic and Financial Factors—Labor Relations*); a compulsory primary election law; the election of all state officials outside the executive branch on a nonpartisan basis, that is, without party designation; and a railroad and warehouse commission of three members elected by the people for six-year terms and charged with regulation in the general interest of rates and practices in a number of public services and utilities.

Executive.—The chief executive officers of the state are governor, lieutenant governor, secretary of state, attorney general, state treasurer, and state auditor. The governor is elected for a two-year term at a salary of \$12,000 a year.

By an act of 1939, the state executive department was reorganized to integrate in an orderly arrangement of departments and divisions, the functions formerly assigned to a variety of uncorrelated agencies. An outstanding feature was the establishment of a department of administration which was given control over all state records, property, budgets, purchases, and contracts. All departments and agencies, except the legislature, judiciary, and state university, were made subject to the department. This process of integration has been continued. For example, in 1953 the divisions of public institutions and social welfare were merged into a single department of public welfare.

Legislature.—The state legislature consists of a Senate of 67 members and a House of Representatives of 131 members. It meets biennially on odd-numbered years for 90 legislative days beginning on the first Monday in January. Senators are elected for four years, members of the House of Representatives for two years.

Suffrage.—All adults are entitled to vote who have been citizens of the United States for at least three months and have resided in the state for six months and in a precinct for thirty days.

Courts.—The state judiciary is composed of a supreme court with a chief justice and six associate justices; one or more district courts in each judicial district; one probate court in each county and a varying number of municipal courts and justices of the peace. All these judicial officers are elected by the voters, those in the supreme and district courts for six-year terms.

Local Government.—Minnesota's counties are governed by boards of five elected commissioners each, except St. Louis County, which has seven commissioners, and Ramsey County, which has six. Other elected county officers include an auditor, treasurer, register of deeds, sheriff, attorney, surveyor, coroner, clerk of court, and superintendent of schools.

Of the 96 communities classed as cities, 74 operate under home rule charters, giving Minnesota first place among the states in the number of its cities having home rule. They constitute almost 25 per cent of all cities in the United States having such independence. Five cities have adopted the city-manager form of government, sixteen operate under the commission form, and the remainder, including Minneapolis, still function with a mayor and city council.

Public Health.—Minnesota was one of the first states to establish a board of health, following only Massachusetts, California, and by one month, Virginia. This was in 1872. The naming of Dr. Charles N. Hewitt as professor of public health at the state university in that same year was the first such appointment in the United States.

The state board of health, consisting of nine

members appointed by the governor for three-year terms, is the official agency charged with reforming the functions outlined in the state statute. It guides and supervises all local boards of health. Its policies are executed by a state department of public health.

Among the outstanding advances achieved by the public health agencies in Minnesota are these:

(1) The lowering of infant and maternal death rates to an almost irreducible minimum. (2) A marked reduction in the mortality rates from the common communicable diseases, and from tuberculosis. (3) Reduction of the incidence of venereal disease to one of the lowest rates in the nation. (4) Development of an exceptionally efficient system for the registration of births and deaths. In a survey of the four months preceding the census of 1940, Minnesota was found to have 99.3 per cent of its births registered. Only one other state had a better record.

Among the newer developments that promise corresponding achievements are the establishment of a special division for cancer control and the inauguration of a program for the better sex education of children. Materials devised by the department staff in this latter program have been adopted for use by schools and public health agencies all over the country.

Minnesota's outstanding public health record has been made in spite of inadequate financial support. In 1915, Minnesota was fifteenth among the states with an expenditure of 3 cents per capita for public health. In 1940, the expenditure had risen to 11 cents per capita, but the rank among the states had fallen to thirty-second.

Social Welfare.—Minnesota has been relatively progressive in its assumption of public responsibility for the care of unfortunates. It was the first state in the Union to treat crippled children at public expense, and a successful campaign in 1949 for marked improvement in facilities for the mentally ill promises to put the state well to the fore in that respect.

Since the establishment of a board of corrections and charities in 1883, public institutions for the handicapped, the delinquent, and defectives have multiplied with the increase in population and with an expanding social conscience. In the reorganization of 1939 (see *Government*) earlier agencies charged with this phase of the state's activities were superseded by a state department of social security, comprising three divisions: (1) the division of social welfare supervises the expenditure of state funds for relief and for aid to the aged, to dependent children, and to the needy blind and other handicapped persons not in institutions. It is the legal guardian for dependent and neglected children. It operates the state tuberculosis sanatorium at Ah-gwah-ching and administers financial aid to the 15 county tuberculosis sanatoriums. It carries on a program of education and treatment for crippled children and a rehabilitation program for the visually handicapped. (2) The division of employment and security assists the unemployed in finding jobs and handles the payment of unemployment compensation. (3) The division of public institutions charged with the administration of 18 state institutions: 7 hospitals for the mentally ill located at Anoka, Willmar, Hastings, Fergus Falls, Rochester, St. Peter, and Moose Lake; a colony for epileptics at Cambridge; a school for the feeble-minded, a Braille and sight-saving school, and a school for the deaf at Faribault; a training school

for boys at Red Wing; a home school for girls at Sauk Centre; the state reformatory for women at Shakopee; the state reformatory for men at St. Cloud; the state prison at Stillwater; the Gillette Hospital for Crippled Children in St. Paul; and a state school for the training of higher-grade feeble-minded at Owatonna.

Education.—In Minnesota education is free for all young people from 5 to 21, and compulsory for all from 8 to 16. Responsibility for providing and maintaining the public schools lies with local district school boards elected by the people, but advice and assistance are provided by a state department of education headed by a commissioner elected by a five-man board of education appointed by the governor.

State support for the schools—amounting to about one third the total cost of maintenance—is derived from four sources: (1) An endowment fund consisting of income from the permanent school trust fund. When Congress made the customary land grant to the new Territory of Minnesota for the support of common schools, it generously set aside two sections in each township instead of the usual one. According to the School Lands Law all money derived from the sale or lease of these lands is held in a permanent trust fund, and some of them have turned out to be worth millions in timber and iron ore, so that by 1946 the permanent school fund exceeded 149 million dollars and was providing an annual income of almost 2 million dollars. (2) A current school fund derived from a general one mill tax. (3) Special state-aid funds biennially appropriated by the legislature. (4) The income tax fund. All state income tax is dedicated for school use, and the increased revenue from this source during the high-income years of World War II had by 1945 accumulated a surplus in this school fund in excess of 20 million dollars.

The endowment and current funds together constitute the general school fund, which is annually apportioned among the schools on the basis of attendance. The special aid fund is so distributed as to foster good standards and in some measure to equalize quality and opportunity among the several counties. From the income tax fund each district receives \$10 a year for each child 6-16 years old living in the district, plus \$10 for each youth 16-17 years old attending a public school.

But in spite of this state support, in the late 1940's a number of the state's school systems, notably those in Minneapolis and St. Paul, were in serious financial straits and found themselves unable to pay their teachers adequate salaries.

In 1946-1947 there were some 7,650 school districts in the state, maintaining 8,252 elementary and secondary schools with a total of 471,030 pupils and 20,194 teachers. It was generally recognized that there were too many small districts, some with as few as five pupils, and the movement for consolidation to reduce costs and improve quality was progressing, though slowly.

Higher education at public expense is provided by 11 junior colleges maintained by local school boards, 5 state teachers colleges, and the state university. The teachers colleges are located at Bemidji, Mankato, Moorhead, St. Cloud, and Winona.

The University of Minnesota (q.v.), chartered by the territorial legislature in 1851, is governed by a board of 12 regents elected for six-year terms by the state legislature. It has become one

of the three largest universities in the country. Although since the establishment of the Mayo Foundation in 1915, the university has offered part of its graduate medical education in Rochester, its work in general has been centered on the main campus in Minneapolis and the agricultural campus in St. Paul, the two being joined by special streetcar service. (Minnesota's federal land-grant college, set up under the Morrill Act of 1862, was made a college of agriculture, forestry, and home economics within the state university instead of the separate institution it is in most states.) A step toward decentralization, however, was taken in 1947, when the state teachers college at Duluth was reorganized as an outstate branch of the university.

There are also fourteen private colleges in the state, as follows:

College	Location
Augsburg College	Minneapolis
Carleton College	Northfield
College of St. Benedict	St. Joseph
College of St. Catherine	St. Paul
College of St. Scholastica	Duluth
College of St. Teresa	Winona
College of St. Thomas	St. Paul
Concordia College	Moorhead
Gustavus Adolphus College	St. Peter
Hamline University	St. Paul
Macalester College	St. Paul
St. John's University	Collegeville
St. Mary's College	Winona
St. Olaf College	Northfield

Libraries.—Minnesota is unusually well provided with libraries—public, college, and institutional—many with special collections of unusual importance. One of them is the James Jerome Hill Reference Library in St. Paul. In addition to its general list of books, the personal library of James J. Hill is housed there with its fine collection of Americana, containing data on western travels and American Indians. See also **LIBRARIES**—United States (Endowed Reference Libraries.)

The chemistry library of the University of Minnesota is exceptionally complete. It has a file of the *Annales de Chimie* dating back to its foundation in 1789, as well as numerous books and treatises on chemistry published as early as 1673. The law library of the university is also outstanding. It contains a large number of 15th and 16th century English law books and also many books of American statute law covering the colonial period and from 1800 to date. Its collection of laws of Indian tribes is one of the best in the United States. The Mayo Clinic Library in Rochester has many interesting old medical works.

HISTORY

Exploration.—The first white men to enter the Minnesota country were adventurous sons of New France seeking a route to the Pacific and on to Cathay. Pushing westward from their settlements on the lower St. Lawrence, they discovered the Great Lakes one after another, and then, lured on by Indian tales of a great river "called the Mechasipi" and of a western sea "whose waters are not fit to drink," they followed the river routes from Lakes Michigan and Superior into the upper Mississippi Valley. Participating, directly or indirectly, in this saga of exploration were such figures of the French regime in American history as Robert Cavalier de La Salle, Samuel de Champlain, Jacques Marquette and Louis Jolliet, Jean Nicolet, Pierre Esprit Radisson and Médart, Chouart de Groseilliers, Father Louis

Hennepin, Daniel Greysolon Dulhut (Duluth) and Pierre de La Vérendrye. They did not find the riches of the fabulous East they sought, but they did discover untold wealth in the beaver muskrat, and other fur-bearing animals of the north country. So they established temporary and scattered forts, opened trade with the Indian and claimed the great northern wilderness as part of the French Empire in America.

This it remained for a century. But when France yielded to Great Britain in the Treaty of Paris, 1763, the Union Jack replaced the flag of France in the Minnesota country east of the Mississippi. The area west of the Mississippi came under the sovereignty of Spain, but in actuality British traders and trading companies were in control of the entire upper Mississippi Valley. They carried on the work of exploration begun by the French, though this was now a byproduct of the fur trade more than of the search for the Northwest Passage. With the successful conclusion of the American Revolution, Minnesota passed into the possession of the United States. It was joined by Minnesota West as a part of the Louisiana Purchase. But in actual fact the British remained in control of the region and its trade until well after the War of 1812.

Settlement.—The earliest effective step toward American occupation of the Minnesota country was the building of Fort Snelling in 1809 at the junction of the Mississippi and Minnesota rivers. This fort served not only as a military center on the frontier, but even more as a base for further exploration of the wilderness, and as a nucleus for settlement. Actual settlement began really under way with the government's purchase from the Indians, in 1837, of the triangle of land between the St. Croix and Mississippi rivers. Once this land had been bought and opened to settlers, the pioneer lumbermen, farmers, artisan townsites speculators, storekeepers, doctors, and teachers began to arrive.

During this early period of settlement the Minnesota country was in succession a part of Michigan, Iowa, and Wisconsin territories—because as a state was formed from each of them the excluded portion of the old territory was added to another political unit. Finally, in 1858, settlement had progressed far enough for Congress to authorize the organization of Minnesota Territory. And when, two years later, the federal government took over from the Indians the bulk of territorial lands west of the Mississippi the influx of settlers, both from older communities to the east and from Europe, began in earnest. Within a decade the population of the new territory jumped from some 6,000 to more than 172,000. Towns sprang up, some actually at some on paper only, stagecoach lines began operation, railroads were chartered, hotels, churches and schools were built, newspapers appeared. In 1858, Minnesota was organized and people enough to be admitted to the Union as the third second state.

Its first years of statehood were marked by participation in the Civil War and, even more, by the memories of Minnesotans, by the Sioux outbreak of 1862 within its own borders. This Indian uprising, one of the worst in American history, resulted in the complete and final expulsion of all the Sioux from Minnesota.

Maturity.—Minnesota remained a pioneer community for some years in its western and northern reaches, but in its older areas it soon

an the development from youth to maturity that has been the central fact of its history since the Civil War. Most of the important aspects of its development have been touched on in foregoing sections: the change from a predominantly rural society to one marked by urbanization and industrialization; the stabilizing of the population; the shift from exploitation to conservation of natural resources; the conversion from one-crop farming to a diversified agriculture; the rise of labor; the growth of cooperatives; the increasing assumption by the state of responsibility for the public welfare. To these should be added the gradual replacement of frontier preoccupation with the interests of the local community by a growing sense of oneness with the nation and, more recently, with the world.

Politics.—One obvious fact about Minnesota's political history is the sustained strength and dominance of the Republican Party—of which the list of the state's governors (see *Government*) provides representative evidence. Equally important, however, has been the persistence of political protest expressed in a succession of third-party movements. Through the challenge these have offered to the control of the Republicans, they have had more influence on governmental policies and legislative developments than their relatively few victories at the polls would indicate.

Minnesota has been a center of what historians call "the agrarian crusade," and until recent decades the farmers have been considerably more important than labor in the protest groups; organized labor was slower to resort to direct political action as a means of achieving its goals. Nonetheless labor has been represented to some degree in virtually all the phases of the protest movement. The Anti-Monopoly Party and Greenback Party of the 1870's, the Farmers' Alliance Party of the 1880's, the Populist Party of the 1890's, and the Nonpartisan League of the 1910's, at the full-fledged union of the two forces came only with the organization of the Farmer-Labor Party and its election of Henrik Shipstead and Magnus Johnson to Congress in 1922 and 1923. The Farmer-Labor Party achieved control of the state in the 1930's with the election of Lloyd B. Olson as governor for three terms (1931-1936), and Elmer Benson for one term (1937-1939). Weakened by factional strife, it functioned in the 1940's only in affiliation with the Democratic Party.

The Democrats have been for the most part a "also ran" group in Minnesota, but they have gained strength through the state's consistent vote for Franklin D. Roosevelt from 1932 to 1944 and for Harry Truman in 1948. (President Roosevelt was the first Democratic presidential candidate ever to win Minnesota's vote.) That Minnesota has so often in recent elections gone Democratic in its presidential vote and Republican for state officers is one evidence of a salient fact in its politics: its voters have become more than usually independent about following party lines. It is perhaps the persistence of a third-party group in some form, with all the shifting alliances and allegiances this has brought, that has made them so.

HELEN CLAPESATTLE,
Editor, University Press, University of Minnesota.

MINNESOTA, a river, which rising in the northeastern part of South Dakota flows through Big Stone Lake on the boundary between Minnesota and South Dakota, then continues southeast in Minnesota a distance of about 350 miles, to where it receives the waters of the Blue Earth, when it turns and flows northeast to the Mississippi River. It enters the Mississippi just south of Minneapolis and opposite Saint Paul. The head waters of the Minnesota rising on the eastern slope and those of the Red River of the North rising on the northern slope of the Coteau des Prairies—the Hill of the Prairies—of Dakota, are but a short distance apart. The Minnesota is navigable to a rapids about 40 miles from its mouth, and for small vessels nearly 300 miles above the rapids. Its whole length is about 475 miles.

MINNESOTA, University of. A coeducational state institution of higher learning on the east bank of the Mississippi River in Minneapolis, Minn., established by an act of the territorial legislature in 1851 and confirmed by the state constitution adopted in 1857. The present charter was adopted in 1868 and the first collegiate work was begun in the following year

under the direction of the first president, William Watts Folwell, a graduate of Hobart College, and a faculty of nine members. The government of the university is vested in a board of 12 regents appointed by the legislature for six-year terms, four members being elected at each biennial legislative session. The university comprises the following divisions: (1) The general college, offering a two-year curriculum in general education leading to the degree of associate in arts; (2) the college of science, literature and the arts, which offers liberal arts and pre-professional curricula; (3) the Institute of Technology, established in 1935, embracing the college of engineering, the school of architecture, the school of chemistry, and the school of mines and metallurgy; (4) the college of agriculture, forestry, home economics, and veterinary medicine offering (a) four-year courses in the fields of agriculture, forestry, and home economics, leading to the degree of bachelor of science or equivalent degree, (b) five-year curricula in forestry leading to the degree of master of forestry, and (c) a four-year curriculum in veterinary medicine, following the completion of two years pre-professional work, leading to the D.V.M. degree; (5) the law school offering courses leading to the degree of bachelor of science in law and the degree of bachelor of laws; (6) the college of medical sciences offering five principal courses: one for physicians, one for nurses, one for medical technologists, one for occupational and physical therapists, one to prepare personnel in all fields of public health, and in addition, in cooperation with the general extension division, a course in embalming and short courses for physicians; (7) the school of dentistry offering two principal courses—a four-year course for dentists and a two-year course for dental hygienists; (8) the college of pharmacy offering a four-year undergraduate course leading to the degree of bachelor of science in pharmacy; (9) the college of education offering many courses of study designed to train students for the different positions in public and private schools and in other educational agencies. The satisfactory completion of a four-year course leads to the bachelor of science degree and to a certificate for school work from the Minnesota State Department of Education. In many cases a five-year program leads to the master's degree; (10) the school of business administration offering a two-year course leading to the degree of bachelor of business administration; (11) the division of library instruction with a full year of professional training in librarianship for students of senior standing; (12) the university college offering to the student of mature age and adequate preparation the opportunity to draw upon any courses offered in the university in preparing a program of study suited to his special intellectual interests or professional aims. The satisfactory completion of an approved curriculum entitles the student to the degree of bachelor of arts or bachelor of science; (13) the graduate school, gathering into a single organization and uniting for the purpose of administration, all the activities of the university in all its schools and colleges insofar as they relate to advanced instruction offered for the second or higher degrees, namely, master of arts, master of science, master of business administration, electrical engineer, mechanical engineer, civil engineer, chemical engineer, and doctor of philosophy.

Graduate work in medicine is maintained in the medical school and the Mayo Foundation for Medical Education and Research; (14) the summer session, organized for two terms of six and five weeks respectively, and operated as a regular part of the university; (15) the general extension division, offering late afternoon and evening extension classes in the Twin Cities, Duluth, and in some other communities. Also administered by this division is KUOM, the University of Minnesota radio station, a 5,000-watt station using a new, modern transmitter; (16) the Duluth Branch, formerly a state teachers college, which became a part of the university July 1, 1947, offers a four-year course for training elementary teachers, a four-year liberal arts course, and pre-professional courses in agriculture, dentistry, engineering, forestry, journalism, medicine, pharmacy, social work, veterinary medicine, and law. The professional schools of law, dentistry, veterinary medicine, education, and business administration require two years of college preparation, and the medical school three years, prior to entrance.

MINNESOTA HISTORICAL SOCIETY. This society was organized in 1891 to collect and preserve materials relating to Minnesota history. It is supported mainly by legislative appropriation and by dues from its 1,500 members. Membership is open to all. The society has a library of 200,000 books, newspaper volumes, and pamphlets, which includes important collections in the fields of Minnesota history, general Americana, genealogy and biography, and the history of Scandinavians in America. In its manuscript division are noncurrent state and local archives and about 5,000 collections of personal papers of individuals, records of business firms, institutions, and organizations, copies of documents in institutions elsewhere, and maps. Its museum comprises a large collection of articles that visualize Minnesota's past, among them about 66,000 pictures. The society publishes a quarterly magazine, *Minnesota History*. It also publishes volumes of *Narratives and Documents*, of *Minnesota Historical Collections*, and of *Special Bulletins*.

MINNETONKA, Lake, mĭn-ĕ-tŏng'kă, lake, Minnesota, situated in Hennepin County, about 12 miles west of the center of Minneapolis. It is approximately 10 miles long and has a maximum width of 2.5 miles. Through Minnehaha Creek its waters are carried to the Mississippi. Minnetonka's natural beauty has been celebrated in such songs as *From the Land of the Sky-Blue Water*, and there are many resorts along its shores.

MINNOW, the common name of numerous fishes of the carp family (Cyprinidae, q.v.). In Europe it usually designates *Phoxinus phoxinus*, a three-inch freshwater fish used for bait. In North America there are more than 1,000 species, ranging in size from five-inch shiners of the Eastern genus *Notropis* to the three-foot squawfish of the Pacific coast. All species have pharyngeal teeth. The name is also applied to such cyprinodonts as the top minnow.

MINO DA FIESOLE, mĕ'nô dă fyă'zô-lă Italian sculptor: b. Poppi, Italy, c.1431; d. Florence, July 11, 1484. He is said to have been a pupil of Desiderio da Settignano, whom he re-

sembles in style, although his work is more uneven in quality. Except for sojourns in Rome in 1454 and 1463, and from about 1473 to 1480, he spent his life in Florence, and there and in nearby Fiesole are a number of his best works. Among them are the tomb of Bishop Leonardo Salutati and the altarpiece in Fiesole Cathedral; the tombs of Bernardo Giugni and Hugh, margrave of Tuscany, and the altarpiece in the Badia of Florence; a tabernacle in Sant' Ambrogio, and busts of Piero de' Medici, Giovanni de' Medici, and Rinaldo della Luna in the Bargello, Florence. In Rome he collaborated with Giovanni Dalmata on the tomb of Pope Paul II (of which fragments remain in the crypt of St. Peter's Basilica), and with Andrea Bregno on that of Cristoforo della Rovere in Santa Maria del Popolo. Among other Roman works are the monument of Niccolò Cardinal Forthguerri in Santa Cecilia in Trastevere and part of that of Pietro Cardinal Riario in Santi Apostoli. The National Gallery of Art in Washington, D.C., has several of his pieces, including *St. Catherine of Siena*.

MINOAN CIVILIZATION. See ARCHAEOLOGY—*Old World* (Neolithic and Later); CHRONOLOGY—*Minoan Chronology*; CRETE; GREECE—2. *Ancient History and Culture*; TO 330 A.D. (Prehistoric Greece [To c.1000 B.C.]).

MINOR, *in law*, is a person who has not reached the age (ordinarily 21 years) of legal capacity and of full civil rights. The term is often used synonymously with infant (q.v.).

In music, the term is applied to intervals and scales. The interval between one note and another of the diatonic scale is named according to the number of tones between them (both notes included), but some intervals—thirds, for example—have four semitones, and some only three. The former is a major interval or major third; the latter, a minor interval or minor third. (See also INTERVAL.) A minor scale differs from a major scale in that it has a minor third. When descending, it may also have a flattened seventh and sixth (melodic minor scale), or, both ascending and descending, a flattened sixth (harmonic minor scale).

MINOR FRIARS or FRIARS MINOR. See FRANCISCANS.

MINORCA, mī-nôr'kâ (Span. MENORCA), island, Spain, situated in the Balearic Islands (q.v.), 23 miles northeast of Mallorca (Majorca). The second largest of the group, it has an area of 264 square miles (293 square miles with dependencies). Its greatest length, northeast to southeast, is 30 miles, and its average width is 10 miles. The coast is deeply indented and has several good harbors, of which the best is that of Mahón, the chief city. The surface is hilly in the north and center, rising to a height of 1,207 feet at El Toro. In the south the land is level and fertile, producing grain, olives, wine grapes, hemp, flax, sweet potatoes, and citrus fruit. Cattle, sheep, goats, and bees are raised, and iron is mined. Metalware, shoes, and textiles are manufactured. The island belonged successively to the Carthaginians, Romans, Vandals, Moors, and Spaniards. Occupied by the British in 1708, it was taken by the French in 1756, but was returned to British control in 1763. In 1783, Spain regained the island and held it thereafter except

for a short resumption (1798–1802) of British rule. Pop. (1950) 42,478.

MINORITIES. The treaties and declarations made under the auspices of the League of Nations provided protection for "racial, religious or linguistic minorities," but in practice these words were found to be imperfectly descriptive of the groups whose protection was intended. Some sociologists have referred to minority groups of distinctive national and cultural characteristics, while others have given greater emphasis to the subjective element of national consciousness which might characterize minorities not distinguished from the rest of the population by obvious features of language, dress, habits, or physique. Without some easily recognizable characteristic associated by both the minority and the majority with stereotyped traits, a minority is likely to be rapidly absorbed and lose its identity. The term "minority" is not usually applied to groups when such absorption is not resisted by either the minority itself or the majority of the population.

At the World Congress of Sociology held in Zurich, Switzerland, in September 1950, Professor Louis Wirth of the University of Chicago emphasized the inferior status of minorities by defining them as "groups distinguished from the rest of society by racial or cultural characteristics [which have] become the objects of differential and inferior treatment, and [have] developed a consciousness of their inferior status" (*International Social Science Bulletin*, vol. 3, p. 410, Paris 1951). The United Nations Subcommittee on Prevention of Discrimination and Protection of Minorities, however, excluded the ideas both of race and of inferiority from its definition, which included as minorities "only those non-dominant groups in a population which possess and wish to preserve stable ethnic, religious or linguistic traditions or characteristics markedly different from those of the rest of the population" (*Yearbook on Human Rights for 1950*, p. 490, New York 1952). The subcommittee also insisted that the minority must include a number of persons sufficient by themselves to develop these characteristics, and that its members must be loyal to the country of which they may be nationals.

Origin and Character of Minorities.—The movements of peoples, ideologies, and political boundaries have meant that distinctive minorities have been common phenomena throughout history. This was true of the Samaritans in ancient Palestine, of Christians in the early Roman Empire, and of Jews and heretical sects like the Albigenses in medieval Christendom. This development has, however, been accentuated by the rise of nationalism in the post-Renaissance period and especially since the French Revolution. Under the influence of Giuseppe Mazzini and other advocates of the principle of nationality, the conception that political boundaries should conform to the national characteristics of the people became a political movement and stimulated governments and other groups to mold people by education, propaganda, and political and legal action to the national stereotype in the minds of the leaders of the movement. Minorities were groups that resisted such efforts at assimilation or that were so different from the majority that the latter did not wish to assimilate them. They remained distinctive groups in the nation and were consid-

ered an unfortunate derogation from the principle of nationality.

In the New World immigrant groups in general wished to be assimilated, and usually were after a generation or two. They consequently did not constitute minorities, although the Indians, Negroes, and Asians, as well as the French Canadians, manifest some characteristics of minorities.

In Buddhist, Confucian, and Hindu Asia the spirit of nationality developed much later, and the religious ideas in this area tended to minimize cultural differences as a foundation for political opposition, although the caste system in India may manifest the subordination of the Dravidian majority to the invading Aryan minority in the 2d millennium B.C. In this area converts to missionary religions such as Islam and Christianity also have some of the characteristics of minorities.

In Africa, European minorities have sought to dominate the natives as the Aryans did in ancient India, but such dominant groups are not usually considered minorities. In southern and eastern Africa the development of large Indian populations has presented a minority problem. In the Union of South Africa the white population, itself divided between English- and Afrikaans-speaking groups, attempts to treat both the Indian minority and the native African majority as minorities.

The Soviet Union, with some 150 distinct nationalities, has claimed to be a multinational state, according each group cultural autonomy, and those occupying large areas political autonomy. The dominant Great Russian nationality controlling the central organs of the monolithic Communist Party has, however, tended to develop minority problems among some of the smaller nationalities both within the USSR and in its surrounding satellite areas.

In western Europe, on the breakup of the medieval system, strong states governed by dynamic monarchs arose before the idea of nationalism had developed. By means of the printing press, education, and propaganda, their governments integrated populations into nations based largely on distinctiveness of language. The Scots and Welsh in Great Britain, the Bretons and Provençals in France, the Catalans, Andalusians, and Basques in Spain, and the Sicilians and Neapolitans in Italy can hardly be called minorities. Whether Italian- and French-speaking Swiss and Flemish-speaking Belgians are minorities is a more debatable question. In the Scandinavian countries there were few groups that could be called minorities. In the German Empire there were French, Polish, Danish, and Jewish minorities. The minority status of the last named, proceeding from religious and cultural distinctiveness, dates from the Middle Ages, and is typical of minorities in that the Jews usually wished to maintain their distinctiveness and were sporadically persecuted.

In eastern Europe and the Middle East the minority problem has been of major importance. Apart from Jews and gypsies who live in small groups throughout much of this area, Poles, Balts, Ukrainians (Ruthenians), Czechs, Slovaks, Yugoslavs, Hungarians, Greeks, Armenians, Syrians, and Arabs were minorities in the German, Russian, Austro-Hungarian, and Turkish empires before World War I. After the war most of these groups established independent countries in which they formed the majority, but it was im-

possible to devise boundaries which would exclude all minorities. In the 14 countries bound by minority treaties or declarations in 1930, which had a combined population of 130 million, minorities were estimated at about 30 million persons, of whom about half were divided equally among Jews, Germans, and Ruthenians, and the other half among some 22 other nationalities. The minorities therefore constituted about 23 per cent of the total population of these countries, ranging from over 30 per cent in Czechoslovakia and Poland to less than 10 per cent in Austria and Greece.

World War II, with its unparalleled persecutions, displacement of populations, and changes of boundaries, resulting in an extraordinary development of national, ideological, and political intolerance, greatly augmented the seriousness of the minority problem in eastern and central Europe, and extended the problem to Asia and Africa and even to the Americas.

The Minority Problem.—The rise of the principle of nationality and the practical propaganda of nationalism have created the general opinion that minorities are undesirable. Resistance to this principle by the Habsburg empire contributed to its demise after World War I. The theory of some liberals like the 1st Baron Acton, who opposed the principle of nationality and drew attention to the stimulating influence of many nationalities under a common government, has generally been discarded, although some advocates of this opinion can still be found in the United States and Great Britain, and it is the official doctrine of the Soviet Union. Advocates of this theory, at least in the West, believe that it can be realized only if education and propaganda are devoted to encouraging a spirit of tolerance and individual freedom, and if constitutional and legal guarantees support principle of human equality and freedom. Such methods, which had considerable influence in the 19th century in moderating the sentiment of nationalism, have declined in influence with the spread of international tensions and ideological conflicts characteristic of the 20th century.

Efforts to realize the principle of nationality, on the other hand, have led to demands for boundary changes which restore irredentas or which permit subject nationalities to become national states. Many such changes were effected after World War I, often as a result of plebiscites. Another possible solution is the conversion of minorities to the national way of life by means of education, propaganda, and legal pressure. Nearly all countries have at times indulged in such Germanization, Italianization, Americanization, or other assimilation movements. Treaties between Poland and Czechoslovakia in 1925 and between Germany and Poland in 1937 reciprocally forbade such denationalization efforts. Still another method of solving the problem is through an exchange of populations, such as those which took place between Greece and Bulgaria in 1919, between Greece and Turkey in 1923, and in the Tirol in 1939 by agreement between Benito Mussolini and Adolf Hitler after the German seizure of Austria.

The more barbarous method of expulsion or extermination of populations to assure national uniformity in the existing area of a country was initiated by Turkey in the case of the Armenians even before World War I, and was carried out on a larger scale by Nazi Germany, involving

the extermination of some 6 million members of Jewish and other minorities and the driving of many others into exile. Soviet Russia exterminated many Poles and deported or exterminated a considerable proportion of the Balts from Estonia, Latvia, and Lithuania. Poland and Czechoslovakia ejected millions of Germans from their territories after World War II, and the formation of the new state of Israel resulted in the migration of 800,000 to 900,000 Arab refugees. The separation of India and Pakistan displaced at least 6 million persons and cost the lives of hundreds of thousands.

These methods of realizing the principle of nationality, which was advanced in the early 19th century as a doctrine of liberalism, progressively increased intolerance and barbarity and raised a serious question as to the validity of the principle altogether.

Protection by the League of Nations.—The regime of minority protection as established under the League of Nations was a political rather than a legal device. It was based on a compromise between the principles of nationality and of liberalism which had been insisted upon by the great powers in treaty provisions intended to protect minorities in the Netherlands (1814), Greece (1830), and Turkey and the Balkans (1856, 1878). It was formally established through the acceptance of concrete obligations in treaties or declarations by the countries in which the problem was most serious, either as a condition of their recognition as independent countries or as a requirement for the establishment of peace in the case of countries which had been defeated in World War I. Such treaties were made after the war with Poland, Yugoslavia, Czechoslovakia, Rumania, and Greece, and minority protection provisions were included in the peace treaties with Austria, Bulgaria, Hungary, and Turkey. No such provisions were included in the peace treaty with Germany, but they were included in the conventions on Upper Silesia and Memel. Declarations accepting obligations similar to those in these treaties were made by Albania, Estonia, Latvia, Lithuania, and Iraq, and by Finland in regard to the Åland Islands. Each of these countries undertook to protect the lives, liberty, and religious freedom of all inhabitants without distinction of birth, nationality, language, race, or religion; to admit the inhabitants of newly acquired territories to its nationality with a right of option for another nationality within a year; to assure civil liberties and linguistic rights to all nationals; to assure special educational and cultural facilities to all nationals who constituted racial, religious, or linguistic minorities; and to accept the League of Nations guarantee of these provisions.

In order to maintain these provisions the League received petitions from individuals residing in the countries concerned. The petitions were screened by the Secretariat and, if found receivable, were considered by a committee of the League of Nations Council. The council would consider the situation indicated by the petition only if it was sponsored by a member of the League. This procedure indicated that the rights assured by the treaty were individual rather than group rights, and the encouragement of separatist movements among the minorities was thus avoided. It was assumed that the minorities were peaceful inhabitants of the country, or loyal citizens whose object was to remedy abuses and not

to disrupt the existing political order. Out of respect for the domestic jurisdiction of the country concerned, petitions were not considered to initiate a legal procedure, but were regarded merely as information which might provide the basis on which some country interested in the minority could initiate a procedure in the council for enforcement of the obligation of the country bound by a minority treaty or declaration. The tendency of the League was conservative. The effort was to protect minority rights without preventing reasonable efforts of the country to assimilate the minorities if it desired to do so.

The concepts of civil liberties for minority individuals, of cultural self-determination for minority groups, and of national solidarity for the country concerned were difficult to reconcile. Minorities themselves usually felt that the protection given by the system was inadequate, often attributing this inadequacy to the political nature of the process and suggesting the establishment of an impartial minorities commission like the Permanent Mandates Commission under the League of Nations. This was not done, but in a few cases opinions were obtained from the Permanent Court of International Justice that were more satisfactory to the minorities than were the council's recommendations. A relatively small number of the petitions sent to the League by members of minorities were considered, and only a small number of those considered resulted in formal action by the council criticizing the country involved. The countries bound by minority agreements resented the discrimination between them and other countries with minorities that were not so bound, and urged that the minority principle either be made universal or be abandoned. They also believed that the system encouraged disloyalty, separatism, and irredentist movements and impeded assimilation.

The United Nations and Minorities.—The United Nations, established in 1945 when the world was slowly recovering from the shock of Hitler's massacres of Jews and other minorities, sought to meet the problem in a more general and more legalistic manner than had the League of Nations. The preamble of the United Nations Charter reaffirmed "faith in fundamental human rights, in the dignity and worth of the human person, in the equal rights of men and women and of nations, large and small," and member nations expressed their determination "to practice tolerance and live together in peace with one another as good neighbors. . . ." These ideas were reasserted as purposes in Article 1, in which are included "respect for the principle of equal rights and self-determination of peoples" and "international cooperation . . . in promoting and encouraging respect for human rights and for fundamental freedoms for all without distinction as to race, sex, language, or religion." These purposes are implemented in various articles of the charter, most concretely in Article 56, by which members "pledge themselves to take joint and separate action in cooperation with the Organization for the achievement of the purposes set forth in Article 55," which include "promotion of universal respect for, and observance of, human rights and fundamental freedoms for all without distinction as to race, sex, language, or religion." Here, as under the League of Nations system, there is a compromise between the ideas of individual rights and group self-determination, but emphasis is placed on individual rights

to a greater degree than under the League of Nations system.

To implement these provisions of the charter the United Nations General Assembly approved without dissent a Universal Declaration of Human Rights in 1948, and the United Nations Human Rights Commission has drafted covenants of human rights which would define these rights as formal treaty obligations and provide procedures for their implementation. No such covenant has been approved by the General Assembly, and on April 6, 1953, United States Secretary of State John Foster Dulles, urged by Senate opposition to treaties which might encroach on domestic jurisdiction, said that it would not be the policy of the United States to approve such treaties. This attitude may have been influenced in part by the insistence of the General Assembly, under pressure by Soviet bloc and Asian states, that covenants should be drafted not only on civil liberties, but also on social and economic rights. Articles defining the right of self-determination of peoples were also drafted by the Human Rights Commission. Such provisions looking toward the welfare state and the self-government of subject nationalities and dependent peoples were more disturbing to the West than were provisions setting standards for the protection of civil liberties.

The Subcommittee on Prevention of Discrimination and Protection of Minorities, set up under the Human Rights Commission, has studied various minority problems and prepared drafts on the subject for inclusion in the covenants on human rights. Many petitions on human rights were sent to the commission, and those dealing specifically with minority problems were transmitted to the subcommittee, but neither body was given power to investigate or act on them.

Despite the many allusions to human rights in the charter and the great efforts of United Nations organs and private groups in the field, the United Nations has no procedure for dealing with minority problems. If the broad obligations of the charter binding members to respect human rights were observed, they would prevent discrimination against minorities, but no means of effective implementation has been devised. Discrimination against and persecution of minorities continue in many parts of the world. The proportion of the world's population suffering because of the failure of governments to respect and protect human and minority rights has probably never been greater in human history. Because the traditions of international law and the modern concept of national sovereignty have treated minority matters as within the domestic jurisdiction of a country, international action to remedy mistreatment is exceptionally difficult. Doubtless little can be done unless international tensions can be reduced, intense nationalism moderated, and a spirit of tolerance and respect for human dignity re-established. This is a problem involving education, political action, legislation, and adjudication, both national and international. Until the general atmosphere is changed, it is doubtful whether effective international procedures for protecting either human or minority rights will be widely accepted.

Professor of International Law, University of Chicago.

MINORITY AND PROPORTIONAL REPRESENTATION. The election of a representative from a single-member district falls to the candidate receiving the highest vote. There is no representation for groups supporting other candidates, except insofar as the person elected gives voice to the wishes of such groups. Hence, direct representation is not afforded minority groups. To give them such representation, various European countries, with Norway taking the lead in its Constitution of 1814, have provided for systems of proportional representation, which necessarily operate in plural-member districts. If, for example, seven persons are to be elected to a city council, or from an election area to a larger legislative body, proportional representation among several parties may be accomplished by having three members come from one party with 42 per cent of the total vote, two from another party with about 30 per cent, and one each from two other parties sharing equally the remaining number of votes.

Many plans for voting have been devised, ranging all the way from a single vote per voter (regardless of the number of places to be filled) to a complicated preferential-and-transfer arrangement. If a single vote is allowed each voter, with election falling to the persons with the highest totals of votes, large factions may get no more representation than other groups winning seats. Through such methods as the limited vote, cumulative voting, and preferential voting, however, relative strength may be reflected.

Limited and Cumulative Voting.—Under the limited-vote method the voter casts his ballot for fewer than the number of persons to be elected—for example, he votes for five when nine are to be chosen. This plan permits at least one minority party to share seats with the leading party, preventing the winner-take-all result that characterizes some electoral systems.

In Illinois, under its 1870 constitution, cumulative voting for the House of Representatives is allowed for each of the state's 51 legislative districts. Three representatives are chosen to the legislature from each district, the voter casting all three votes for his favorite candidate, one and one-half votes for each of two candidates, or one vote for each of three different candidates. This plan has no counterpart in other states. The practical workings of the Illinois system have led the two major parties to offer two candidates each, thereby assuring two seats to the stronger party in a district and the third seat to the weaker party. But understandings in advance may lead simply to the running of two candidates by the admittedly stronger group and one candidate by the weaker, thus leaving no real choice to the voters unless there are strong competing minor parties or independent candidates.

List System of Proportional Representa-

tion.—Proportional representation operates according to the list system in several European countries. Under this system voters designate their party rather than the candidates of a party, and seats are assigned to the parties in proportion their total vote. If, for example, 20 persons are to be elected and one party gets 55 per cent of the votes cast, it elects 11; the other party or parties with 45 per cent elect the remaining 9. Actually, more splintering than this takes place, and no party is likely to get more than 30 or 40 per cent of the vote. A party with 5 per cent of the total vote will receive 1 seat in 20. In countries not having the individual vote, party leaders name the sequence of candidates on the list, and those at the top are elected to the number of seats the party gets. A variation of the plan (as in France) allows the voter to indicate his preference as to candidates within each party, as well as to vote for a party list. Those candidates having the highest votes in a list are elected to the number of seats that the party is entitled to by proportional representation.

Under the Weimar Republic (1919–1933) the quota to elect a representative to the German Reichstag was 60,000. A party with 125,000 votes in a district elected two members and had a surplus of 5,000 votes. Surpluses in several districts could accumulate 60,000 votes and thus entitle the party to an additional member for the whole region. The Constitution of the Federal Republic of Germany (1949) provided for a single-member district system for three fifths of each state's representation in the Bundestag and proportional representation for election of the remaining two fifths. (In 1953 the Bundestag adopted a new combination election system.)

Americans often associate the weakness of the Weimar Republic and the Third and Fourth French republics with the multiparty systems of Germany and France, and therefore condemn proportional representation, which encourages the splintering of parties. Essential differences are revealed in the operation of two-party and multiparty systems. In a two-party system the factions of a party generally adjust their differences before an election campaign, but in a multiparty system adjustments are constantly taking place within Parliament after the election. The political pattern of France reflects a highly individualistic people.

Hare System of Proportional Representation.—Under this system, which is named for the English political reformer Thomas Hare and is used in some United States cities, the voter marks first, second, third, and other choices. Election is based on a quota determined by the following formula: The total vote cast is divided by the number of seats to be filled plus one, and one is added to the quotient. If 100,000 votes are cast and four seats are to be filled, divide by five to get a quotient of 20,000, then add one to get 20,001, which is the quota. A candidate receiving the quota of first-choice votes is elected. Surplus votes are counted for second choices, thus adding to the totals of other candidates. When other candidates reach the quota, their surpluses are distributed to later choices. The next calculation is to drop the lowest candidate and distribute his votes to the next choices marked. When the required number reach the quota, the counting terminates.

A party with a very popular candidate does not, under this system, waste votes beyond his

quota, for the excess votes are distributed—probably to others in his party. Votes far down the scale are not wasted because the successive elimination of party members allows one man to be elected provided the total concentration reaches the quota. While this system provides for the single transferable preference vote, it must be distinguished from various forms of preferential voting, such as a plan of adding all second choices to all first choices or a plan for presidential preference primary voting.

In the United States the two most notable experiments with proportional representation have been in New York City (from 1936 to 1947, when it was abandoned largely because of distrust of Communist representation in the city council) and Cincinnati (adopted in 1924). About 20 other cities in the country have used proportional representation, but only half this number operated under it in 1955.

MINOS, mī'nōs, in Greek mythology, a king of Crete. The oldest traditions describe him as a wise lawgiver who became a judge of the underworld. He was the son of Zeus and Europa and, according to most accounts, the husband of Pasiphaë (other legends make this Minos a grandson of the same name), whose unnatural passion gave birth to the Minotaur (q.v.). He gained control of many lands through seapower and was overlord of Athens, from which—in revenge for the death of his son Androgeos at the city games—he exacted a periodic tribute of seven youths and seven maidens (the tribute was made yearly or, according to Plutarch, every ninth year). They were sacrificed to the Minotaur, who was kept in a labyrinth designed by Daedalus (q.v.). On the third occasion the great hero Theseus volunteered to join the group and, with the aid of Daedalus and Minos' daughter Ariadne, killed the Minotaur and led the others to safety. Minos himself is said to have been killed in Sicily while in pursuit of Daedalus. (See also LABYRINTH.) It is probable that Minos was a dynastic title borne by a number of rulers. The name is now applied to the Minoan civilization which flourished in Crete during the Bronze Age.

MINOT, mī'nūt, Charles Sedgwick, American biologist and educator: b. West Roxbury, Mass., Dec. 23, 1852; d. Boston, Mass., Nov. 19, 1914. Following his graduation from the Massachusetts Institute of Technology in 1872, he studied at Leipzig, Paris, and Würzburg, and then at Harvard, from which he received his D.Sc. degree in 1878. From 1880 until his death he taught embryology and anatomy at Harvard Medical School, becoming a full professor in 1892. Minot did much to reform the system of medical education. He invented two forms of the microtome (q.v.) and made notable contributions to the study of embryology and of senility. His published works include *Human Embryology* (1892); *A Laboratory Text-Book of Embryology* (1903); *The Problems of Age, Growth, and*

Death (1908); and *Modern Problems of Biology* (1913).

MINOT, George Richards, American physician and pathologist: b. Boston, Mass., Dec. 2, 1885; d. Brookline, Mass., Feb. 25, 1950. He received his medical degree from Harvard University in 1912, and from 1928 to 1948 was professor of medicine at the same institution. During the same period he served as director of the Thorndike Memorial Laboratory at Boston City Hospital, his special field being in diseases of the blood. In 1924 he began his research on the value of liver in treating pernicious anemia, which work led to his winning of the Nobel Prize in physiology and medicine in 1934, this honor being shared with William P. Murphy and George H. Whipple. One of the most important of his many published works (in collaboration with William B. Castle) is *Pathological Physiology and Clinical Description of the Anemias* (1936).

MINOT, Laurence, English lyric poet: b. ?1300; d. ?1352. Nothing is known of his life, but from the detailed descriptions in his 11 extant poems it is generally believed that he accompanied Edward III on some of his famous campaigns. Among the battles celebrated in the poems are those of Halidon Hall (1333); Crécy (1346); Neville's Cross (1346); and Calais (1347).

MINOT, mī'nūt, city, North Dakota, seat of Ward County; altitude 1,590 feet; on the Souris (Mouse) River, 100 miles northwest of Bismarck; served by the Great Northern and the Minneapolis, St. Paul and Sault Ste. Marie railroads. It is an important distribution point for a wheat-growing, stock-raising, and dairy-farming region. Industries include flour milling and the processing of dairy and poultry products. Railroad shops also furnish considerable employment. The city lies in the midst of the vast North Dakota lignite coal fields and southeast of the city is located one of the country's largest lignite coal-stripping plants. Minot is the home of one of the state teachers colleges. The town was incorporated in 1887. Government is administered by a council and city manager. Pop. (1940) 16,577; (1950) 22,032.

MINOTAUR, mīn'ō-tōr, in Greek mythology a monster, half man, half bull, which was the offspring of Pasiphaë, wife of Minos, a king of Crete. During the period when Minos demanded that Athens send him an annual tribute of youths and maidens, it was the Minotaur, confined in the labyrinth built by Daedalus for Minos, which devoured them. Not until Theseus slew the monster was Athens released for this tribute. See also LABYRINTH; MINOS; PASIPHAE.

MINOTS LEDGE or **COHASSET ROCKS**, in Massachusetts, a promontory and lighthouse in Boston Harbor.

MINSK, mīnsk; Russ. myēnsk, city, USSR, capital of Belorussian SSR, and of Minsk Oblast. It is in west-central European Russia, on the Svisloch River, a tributary of the Berezina. The city was founded in the 11th century, and has been under Russian rule since 1793. It is a junction for Moscow-Warsaw and Baltic-Ukraine

railways and airways. Industries are varied, including automobile, tractor, machine building, woodworking, linen, synthetic leather, food, and motion picture factories. Minsk is the seat of a university and several colleges. Damage during World War II was exceedingly great, but the city is being rebuilt. Pop. (1946) 300,000.

MINSTER, mīn'stēr (Anglo-Saxon, *mynster*, from Lat. *monasterium*), anciently signified the church of a monastery or convent. In many instances the name has been retained and applied to the church after the monastery no longer exists. It is also often given to a cathedral or large church which was never monastic; for example, York Minster. The word is also found as part of the name of several places, such as Westminster and Minster-in-Thanel.

MINSTREL, mīn'strēl, a name introduced into England by the Normans, and designating singers and performers of instrumental music together with jugglers, dancers, sleight-of-hand performers, and similar persons who entertained. See also BARD; MINNESINGER; NEGRO MINSTRELS; PROVENÇAL LITERATURE; SKALD.

MINT, an aromatic plant of the genus *Mentha*. The species are characterized by square stems; opposite simple leaves; and small purple, white, or pink two-lipped, axillary flowers in whorls which often form terminal spikes. All mints are noted for the fragrance of their foliage due to the presence of essential oils, for the production of which half a dozen species are more or less cultivated. The following are the most important: spearmint (*M. spicata*); peppermint (*M. piperita*); pennyroyal (*M. pulegium*); bergamot mint (*M. citrata*); and Japanese mint (*M. arvensis* var. *peppercrascens*).

Besides these cultivated species, which are frequently found as escaped plants near gardens, there are several other species, of which the following are perhaps best known: round-leaved mint (*M. rotundifolia*), a native of Europe, naturalized rather interruptedly in the coast states from Maine to Texas; water mint (*M. aquatica*), with hairy stems, rather rare in wet places in New England and southward to Maryland; whorled mint (*M. sativa*) and its close relative, corn mint (*M. arvensis*), which are found in damp fields in New England; and wild mint (*M. canadensis*), which extends northward from the Northern states across the continent. All are recognizable by their resemblance to other members of the genus, especially by their odor. Several other related plants of other genera are called mint, among them being mountain mint (*Koellia*), also popularly known as basil. The numerous species are widely distributed throughout the United States and Canada, and have a mint-like flavor and odor. Catnip (*Nepeta cataria*) is often called cat mint, and several species of *Monarda*, especially *M. punctata*, are known as horsemint.

The half-dozen cultivated mints are managed alike. They will grow on any soil that will produce good crops of potatoes, but since they are considered exhausting crops, are included in the rotation only once in five or more years. Upon reclaimed swamps, however, which are considered best adapted to their cultivation, they are generally allowed to remain consecutively for five years or even more without

change of crop. The land having been plowed, harrowed and otherwise fitted, small pieces of the root-stock are dropped at intervals of a few inches in shallow furrows about 30 inches apart. All through the season the land is kept scrupulously free from weeds, especially of smartweed, fireweed, ragweed and horseweed, which seriously injure the product if included in the "hay" from which the oil is distilled. Hand-weeding is commonly practised after horse cultivation is stopped by the luxuriant vines. About midsummer, or when the earliest flowers appear, the tops are cut, either with scythes or sometimes with mowing machines, and cured like hay. They are then stored under cover for distilling. This process is usually conducted with steam, which enters the still below, passes upward through the mass of hay, carrying the essential oil with it, and condenses in coils of pipe chilled by running water. After condensation, the oil and water separate by gravity. After standing for a greater or less length of time, crystals of menthol (q.v.) appear in the oil of peppermint. The annual yield of oil per acre sometimes exceeds 50 pounds, and sometimes a second profitable cutting of the crop may be made in autumn. Having once been planted the crop takes care of itself from year to year. The most important producing centre is in southwestern Michigan and northwestern Indiana. Perhaps next is Wayne County, N. Y. Other important mint fields are at Mitcham, Surrey and Lincolnshire, England, and in Saxony, Germany.

MINT, derived from the Latin word *moneta*, a name of Juno, known as the Roman goddess of coin or money, Anglo-Saxon *mynet*. A government establishment for coining of lawful metallic money.

Metals were used for money in ancient Egypt as early as 2500 B.C. The Old Testament (Genesis 23.16) tells of merchants using gold and silver bullion for money. The first coiners of gold and silver known to history were the Lydians (about 550 B.C.). The Greeks learned coinage from Lydia and the art was taken to Rome from Greece. Metals other than gold and silver which have been minted include copper, nickel, zinc, tin, aluminum, manganese and iron.

In Great Britain during Anglo-Saxon times a large number of mints were established throughout the country under control of moneyers—officials responsible for the integrity of the coinage. Later it became the custom to establish a temporary mint wherever the sovereign happened to reside. The Royal Mint in London now supplies most of the coins of the British Empire except for Australia, Canada, India and South Africa which also operate mints. Some smaller governments which have no mints in their own countries contract for their distinctive coins from mints of larger countries.

The first mint of the United States was established at Philadelphia by Act of Congress dated April 2, 1792.

At the time of the adoption of the Constitution in 1789 the monetary system of the new republic was in confusion. The coins in principal use were those of various foreign nations. The Continental Congress had declared for a decimal monetary system. Thomas Jefferson who became secretary of state with the inauguration of President George Washington, and Alexander Hamilton, who became the first secretary of the treas-

ury, were responsible for most of the suggestions which were incorporated in the act establishing a monetary system and the mint. Jefferson advised the adoption of the dollar as the unit of the new system. The dollar corresponded with a Spanish coin, variously known as the pillar dollar, milled dollar, or "piece of eight," with which the colonies had long been familiar. Jefferson also advised that the unit of value be attached to both gold and silver. Hamilton, in an official report to Congress, recommended that the mint ratio between gold and silver be 1 to 15, a proportion corresponding to the bullion values of the period, and the coinage of gold, silver and copper. He also proposed a schedule of coins to be minted.

The Act of April 2, 1792, provided for the coinage of the gold eagle (\$10), half-eagle and quarter eagle; the silver dollar, half-dollar, quarter-dollar, dime (originally spelled "disme") and the half-disme or half-dime; the copper cent and half-cent. The Mint was first placed under the secretary of state, but was later transferred to the secretary of the treasury.

The first coins, one cent and one-half cent pieces, were struck in March, 1793. A hand-operated press was used to impress on the new money the design established by Congress. An old engraving conveying the artist's impression of the scene shows President and Mrs. Washington, Jefferson, Hamilton and Mrs. Hamilton, and other officials of the new republic, viewing the first coins. Another engraving of the same date shows the exterior of the Mint building which was protected by a guard and a watch dog. The guard made rounds of the premises at stated intervals, ringing a bell at the rear of the building to signify his presence. The first coins on the obverse showed a bust representing the Goddess of Liberty. This was in conformity with the Act of Congress requiring "an impression emblematic of liberty" with an inscription of the word "Liberty" and the date of coinage. On the reverse of the copper coins the denomination appeared enclosed in a circular chain of fifteen links. The Act required that the reverse of gold and silver coins should include "the figure or representation of an eagle with the inscription 'United States of America'" and this direction was followed as gold and silver coins were produced later.

Prior to the adoption of the Constitution, the Continental Congress in 1787 had arranged for the minting of copper one cent pieces under private contract. This coin is known by collectors as the "Franklin cent," though there is no evidence that Benjamin Franklin was concerned in the design. The design specified by Congress called for a circular chain of thirteen links enclosing the motto "We Are One" on one side of the coin. The other side of this coin showed a dial with hours marked upon it, the noonday sun above, the Latin word "Fugio" (I fly), or in connection with the symbol of the dial "Time Flies," and the phrase "Mind Your Business." The circular chain, used in the 1793 design, apparently was derived from this pre-Constitution coin. In later copper coinage of the same year, a wreath took the place of the chain.

The word "Liberty" has appeared generally upon the face of coins from the first minting. Two other mottoes were developed later to be incorporated in most subsequent designs. The words "E Pluribus Unum" (One out of many), taken from the Great Seal of the United States,

were first used on the half-eagle in 1795. The motto "In God We Trust" made its advent on coins in 1866, an outgrowth of the religious sentiment of the Civil War period.

In the early years of the republic domestic production and supply of precious metals were relatively small. Foreign coins continued to circulate with the domestic coins and were assigned legal value by acts of Congress. This condition continued until 1857 when all acts authorizing the currency of foreign coins were repealed.

The Bureau of the Mint in Washington, headed by the director of the mint, administers the activities of seven field institutions: coinage mints at Philadelphia, San Francisco and Denver; Assay Offices at New York and Seattle; gold bullion depository at Fort Knox and silver bullion depository at West Point.

The principal functions of the mint service today include the manufacture of domestic silver and minor coins; the acquisition of gold and silver bullion (payments for which are made on the basis of mint assays); the safeguarding of the government's holdings of the monetary metals, including coins in processing stages until finished and distributed to the treasurer of the United States or to Federal Reserve Banks. Other major activities include the refining of gold and silver, coinage for foreign governments, manufacture of gold, silver and bronze medals, and coinage dies and, in addition, special assays of bullion and ores.

The mints established in the United States are listed below:

PHILADELPHIA

Authorized by Act of April 2, 1792
Organized—1793

DENVER

Authorized by Act of April 21, 1862, but operated as an assay Office until passage of Act of Feb. 20, 1895, which provided for a coinage mint
Organized—February 1906

SAN FRANCISCO

Authorized by Act of July 3, 1852
Organized—1854

CHARLOTTE, N. C.—gold coinage only

Authorized by Act of March 3, 1835
Cornerstone laid January 8, 1836
Organized—1838
Coinage suspended May 20, 1861

DAHLONEGA, GA.—gold coinage only

Authorized by Act of March 3, 1835
Organized—1838
Coinage discontinued February 1861

CARSON CITY, NEVADA

Authorized by Act of March 3, 1863
Organized—1870
Coinage discontinued May 1893

NEW ORLEANS, LA.

Authorized by Act of March 3, 1835
Organized—1838
Coinage suspended from 1861 to 1879
Coinage discontinued April 1909
Office closed June 30, 1942

MINTON, Thomas, English pottery manufacturer: b. Wyle Cop, Shrewsbury, 1765; d. 1836. While learning the art of engraving he

acquired a knowledge of the process of printing on delft or chinaware. He settled at Stoke-on-Trent in 1791 and founded a pottery factory with the object of producing glazed pottery in the highest style, which should compete with the productions of foreign countries. He was completely successful and the range of his manufactures was increased by his son, Herbert Minton (1793–1858), who succeeded him in 1836, and manufactured the famous Parian porcelain and the encaustic tiles, with which the name Minton is now most commonly associated.

MINUCIUS FELIX, Marcus, probably the earliest Latin apologist of Christianity. Although he is mentioned by Lactantius and Saint Jerome, practically nothing is known of his life except what may be gathered from his one known work, *Octavius*, a popular defense of Christianity in dialogue form. Almost all modern critics agree in putting the date of its composition before that of Tertullian's *Apologeticum* (197) which bears a close resemblance to it, although the matter has been the source of great controversy. Waltzing, who has published the best and most recent edition (Leipzig 1912) and made many other valuable contributions to the literature of the subject, places it between 160 and 185. There is an English translation in the *Ante Nicene Fathers*. The dialogue, which is modeled chiefly on Cicero's *De natura deorum*, takes place between three lawyers: the author (who acted as judge), Caecilius Natalis (a pagan and native of Citra), and Octavius Januarius (like the author, a Christian convert and native of Africa). The three had left Rome during the autumn vacation for a sojourn at nearby Ostia, where on a walk along the strand the discussion was provoked by the saluting of a statue of Serapis by Caecilius. By agreement he begins, giving an arraignment of Christianity which alleges the impossibility of man arriving at truth, the inexpediency of disturbing long-established religious beliefs (especially those which have been the cause of Rome's greatness), the want of culture among the Christians, the indecency of their worship, and the inherent absurdity of their doctrines. Refuting these allegations point for point, Octavius, upon purely philosophical grounds and therefore without explicitly quoting the Holy Scriptures or mentioning the name of Christ or the mysteries of Christianity, treats of the creation, Providence, the unity of God, the absurdity of paganism, the resurrection, and the reward after death. Caecilius acknowledges himself vanquished, but wishes some further explanations to be made later. The dialogue, in spite of the inevitable traces of the general decadence of taste, attains a rare degree of elegance, grace, and limpidity. The introduction especially is a masterpiece because of the naïveté and naturalness with which the stage is set. Saint Jerome speaks of another work appearing under the name of Minucius Felix, *De fato vel contra mathematicos*, but believes that it is not genuine because of the difference in style. Minucius in his dialogue had promised a special work on fate and it may be that this inspired the publication under his name of a work that was not his.

HERBERT F. WRIGHT.

MINUET, mīn'ū-ēt', a graceful and stately dance of French origin, the name of which, derived from *menu*, small, was suggested by the little steps. It developed from the *branle* of Poitou and was introduced into Paris in 1650. It was at first a gay and sprightly dance; but after appearing at court it became grave and very dignified. It is mentioned by Beauchamps, father of dancing-masters, who flourished in the reign of Louis XIV, and also by Blondy, his pupil; but it was Pécour who gave the minuet popularity. The first known minuet tunes of artistic value were written by Lully (composer of ballets and operas) in 1653. The minuet was a great favorite at the court of Louis XIV, and was equally popular in the contemporary court of Charles II in England, where it continued in vogue into the reign of George II. The minuet reached perfection in the reign of Louis XV. It was then a dance for two persons, in moderate triple time, and was generally followed by the gavotte (q.v.). Afterward the minuet was considerably developed, and, with the gavotte, became chiefly a stage dance and a means of display. The original court minuet was a grave and simple dance, although it did not retain its simplicity for long. It was elaborated and molded into a beautiful form—the perfect expression of an age in which deportment was carefully cultivated, manners were polished and bodily grace developed to the highest degree. The many slow graceful movements, the bows, the pauses to be filled with pretty compliments and the opportunity the dance gave for the display of beauty and bravery of costume made the minuet a factor in the polite world on both sides of the Atlantic. These court minuets were written in three-quarter time and consisted of two eight-bar phrases, each of which was repeated. Mozart's beautiful minuet in *Don Giovanni* shows the form exactly. The form was soon extended. As a complement to the first movement, a second minuet was added, similar in form but contrasted in feeling. This, being usually written in three-part harmony, received the name of Trio, a name retained to the present time, long after the restriction as to the number of parts has been abandoned. A further enlargement of the form of the minuet consists of the extension of the number of bars to 16. Bach and Handel introduced the minuet into their suites and Handel also used it frequently as a concluding movement for the overtures to his operas and oratorios. Bach's minuets are remarkable for their variety of form and character. The historic importance of the minuet arises from the fact that it still holds its place in the symphony, the descendant of the suite. The first composer to introduce the minuet into the symphony appears to have been Haydn. Examples are also found in Haydn's string-quartets. Haydn, however, while retaining the form, changed the spirit and introduced a light-hearted humor. The form of Mozart's minuets is identical with Haydn's, but Mozart again changed the spirit and in his hands tender-

ness and grace take the place of mere exuberance. It is in Mozart's concerted instrumental works that his minuets are chiefly to be studied. Beethoven continued the popularity of the minuet. The beautiful minuet in the last scene of Verdi's *Falstaff* is a most happy adaptation of the old form to modern music.

MINUIT, mē'nwē'; mīn'ū-īt, or **MINNE-WIT**, mīn'ē-wīt, **Peter**, director general of New Netherland and first governor of New Sweden: b. Wesel, duchy of Cleves, 1580; d. Saint Christopher, West Indies, 1638. He was probably of French or Walloon descent since he pronounced his name like the French word *minuit* and his coat of arms bore a bat, the emblem of midnight. In 1625 he was a member of the council of Willem Verhulst, the West India Company's director of New Netherland, but the same year returned to Holland. In January 1626 he sailed again for Manhattan arriving there on May 4. Verhulst continued as director of the colony until Sept. 23, 1626 when Minuit succeeded him and was the first of the company's governors to bear the title of director general. One of his first official acts was to legalize the occupation of Manhattan by obtaining a deed of purchase from the Indians for trinkets valued at 60 guilders (\$24). When regular church services were inaugurated in Fort Amsterdam in 1628 by the Rev. Jonas Michaëlius, Minuit served as an elder. Recalled to Holland by the company's Amsterdam Chamber in 1631 in consequence of a bitter dispute with Johan van Remunde, secretary of the colony, he was dismissed from the company's service. However, some years later Samuel Blommaert, one of the company's directors, gave him a high recommendation to Axel Oxenstierna, the Swedish chancellor, who commissioned him to found a Swedish settlement in America. In the spring of 1638 he purchased from the Indians a tract on the right bank of the South (Delaware) River and built Fort Christina on the site of Wilmington, Del. Later that year he left Måns Kling in charge of the colony of New Sweden and sailed for Saint Christopher where he exchanged his cargo for tobacco. While he was paying a visit to the captain of a Dutch merchantman in the harbor, a hurricane struck the island. The ship foundered and he was drowned. See the article by A. J. Barnouw in *The Dictionary of American Biography*.

MINUTE, a division of time and of angular measure; the 60th part of an hour, and the 60th part of a degree. In astronomical works minutes of time are denoted by the initial letter *m*, and minutes of a degree or of angular space by an acute accent ('). In architecture the 60th part of the diameter of a classic column, measured at the base.

MINUTE MEN, in the American Revolutionary War, the militia, who were prepared for service at a minute's notice. They were principally civilians, resident in Massachusetts, who were enrolled in accordance with an act of the provincial congress, passed Nov. 23, 1774. There were in Boston alone 16,000 minute men ready for service.

MINYAS, mīn'i-as, in Greek mythology, the son of Chryses, the hero of the *Minyae*, from

whom were descended most of the Argonauts. His three daughters, Alcithœ, Leucippe, and Arsippe, were changed into bats for having made light of the mysteries of Dionysus.

MIOCENE, in geology, the fourth epoch of the Tertiary period, spanning about 10 million years and ending about 10 million years ago, follows the Oligocene and precedes the Pliocene epochs. The name was given in 1833 by Sir Charles Lyell on the basis of studies in France and Italy from the Greek in reference to the rocks having only a "minority of the recent" fossil mollusks. The Alps were severely deformed and raised during the Miocene epoch as were the Caucasus, the Himalayas, and the Andes. While areas of the Coast Range in California rose, Miocene marine sediments exceeding a mile in depth were laid in the area of the Great Valley. Similar marine rocks along the coast of Oregon and Washington adjoined plains of contemporaneous lava flows extending eastward to Yellowstone Park. In the Great Plains of Nebraska and the Dakotas and extending to the Gulf coast, gravels and clays were laid by streams arising in the present Rocky Mountain region. In Texas, a thin layer of surface terrestrial sedimentary rocks thickening to a layer more than a mile in depth of marine sedimentary rocks beneath the shore of the Gulf of Mexico was formed. Thinner marine rocks of this period crop out eastward to Florida and northward to New Jersey.

MIOHIPPIUS, a genus of small horses of the Oligocene period in North America. See HORSE—*Evolution*.

MIQUELON, mīk'ē-lōn, French mē-klōn', an island, is located in the Atlantic Ocean near the southern coast of Newfoundland, at the entrance to Fortune Bay. With Saint Pierre (q.v.), it forms a French colony, the two islands being the only remnant of the once vast French empire in North America. The southern part of Miquelon, called Little Miquelon (*Petite Miquelon*) or Langlade, was once a separate island but since 1783 has been connected with it by a sand bar. Under the direction of the commandant of Saint Pierre, Miquelon is occupied only by a few families engaged in the fisheries. The area is 83 square miles. Pop. (1946) 550.

MIR, in czarist Russia, was the name of a rural commune, consisting of the inhabitants of one or more villages, who were, as a community, owners of the surrounding land and who were mutually liable for the taxes. From time to time the land was redistributed among the members. The mir was self-governing as a community, with elective officers, but was subject to higher control.

MIRA, mī'rā, in astronomy, "the wonderful star," Omicron Ceti, is a remarkable variable situated in the neck of the constellation Cetus, "the whale." It was discovered in 1596 by David Fabricius, and its variability was apparently first noticed in 1638. The period of this star, which is rather irregular, averages about 330 days. During the greater part of this time the star remains at about the 9th magnitude, but during about 100 days it rises to a maximum which may vary from the 2d to the 5th magnitude, remains for a week or 10 days there, and then sinks to

its minimum again. When shining with a brightness of the 2d magnitude, it is giving out more than 600 times as much light as when at the 9th magnitude. Its greatest recorded variation occurred between the years 1779 and 1783, when, after attaining a brightness equal to that of the first magnitude star, Aldebaran, it sank so low that it was invisible, even in telescopes showing stars of the 10th magnitude. The period of its changes is also irregular, sometimes varying to the extent of two months. Thus, neither the times of greatest brightness nor the amount of the brightening can be accurately predicted.

As to what occurs in this and similar long period variables to occasion so great an outburst of light at the approximately constant interval of about 11 months, we are ignorant. As the time of greatest brightness of Mira approaches the spectrum gives evidence of powerful disturbance, and the outburst is from the depths of the Sun, the outlying strata of vapors remaining comparatively cool. A periodical surging of the material of the ball of the Sun is thus suggested and this surging is so widespread as to amount to a real bodily distortion rather than to a mer tide, but the cause of this disturbance we not know.

MIRABEAU, mē-rā-bō', Anglicized mīr'a-bō' COMTE DE (HONORÉ GABRIEL VICTOR RIQUET), French orator and revolutionary leader: b. Bignon near Nemours, March 9, 1749; d. Paris, April 1791. He entered the Berry cavalry regiment in 1767 and was soon promoted to second lieutenant, but because of misconduct he was later imprisoned on the island of Ré until March 1769. He then joined an expedition to Corsica, was commissioned captain of dragoons in 1771, and in 1772 was married. In 1774, owing to debt and quarrels with his wife and father, he was imprisoned in the Castle of If, and the next year was transferred to the Castle of Joux, near Pontarlier. Here he fell in love with the young wife of the Marquis de Monnier. Trouble ensued, and Mirabeau finally escaped to Switzerland, where he was joined by his mistress, Sophie, as he called her, and in October 1776 he settled in Amsterdam. In May 1777, however, they were arrested, brought to Paris, and Mirabeau was imprisoned again for three and one-half years. It was at this time that his erotic letters addressed to Sophie were written. Having secured the revocation of the death sentence imposed upon him for the seduction of Sophie and being legally separated from his wife (1783), he left France for a few months.

Upon Mirabeau's return he began his intimacy with Henrietta van Haren, known as Mme. de Nehra, whose influence was undoubtedly exerted to his great benefit. In August 1784 he was forced to flee to London to allow more trouble to blow over, and while there he wrote *Considérations sur l'Ordre de Cincinnatus*. About this same time he began to devote himself completely to politics and was entrusted by Calonne with a secret mission to Prussia in 1786. As a result of this and a subsequent mission to Prussia, he published *De la Monarchie Prussienne sous Frédéric le Grand* in 1788 and *Histoire Secrète de la Cour de Berlin* in 1789. His attacks on the government of Louis XVI eventually made him well enough known to the tiers

that to be elected by the town of Aix to be its representative in the States-General of 1789. Here he speedily eclipsed all the other orators of the Assembly, and became the centre round which gathered all the men of greatest mark and force of character in the third estate. He was the immediate cause of the French Revolution, by the resistance which he offered to the demand of the king after the royal sitting of 23 June 1789, that the third estate should vote separately from the other two orders. It was on this occasion that he gave the vigorous reply to the grand-master of ceremonies, who had communicated to the Assembly the royal will, concluding with the words, "Go and tell your master that we are here by the will of the people, and that no one shall drive us out except by the force of bayonets." Both before and after this occasion he delivered many eloquent speeches, which obtained for him the title of the "French Demosthenes." Among the most remarkable of these are his address to the king demanding the removal of the troops encamped at Versailles, speeches on the national bankruptcy, on the civil constitution of the clergy, on the royal sanction, on the right of peace and war, and his reply to the Abbé Maury on ecclesiastical property. After having shown himself a bold reformer, and the most dangerous adversary of the court, Mirabeau ended by offering his support to the throne; the court paid his debts and supplied him with funds, although he continued to make a show of opposition to royalty in order to uphold his popularity. This state of matters dates from May 1790. It appears to be true that in this change of position he acted from conviction, foreseeing the imminence of a great catastrophe, which he desired if possible to avert. Whatever may have been his motives, this conduct, when it became known, naturally raised up against him numerous enemies. But on 30 November he was elected president of the Jacobin Club, and on 24 Jan. 1791 of the National Assembly. His remains were buried with great pomp in Sainte-Geneviève Church (the Pantheon), but three years later they were exhumed to make room for those of Marat. Mirabeau's aim was to make France a constitutional monarchy after the English pattern. Statesmanship and oratorical powers were marvelously combined in him. Mme. de Staël said of him that his speech was "like a powerful hammer, wielded by a skilful artist, and fashioning men to his will." His speeches, however, were not his own altogether: a group of his friends united to supply him with the framings, and these he suffused and sublimated with his own genius.

MIRABILITE. A mineral consisting of hydrous sodium sulphate or glauber salt, $\text{Na}_2\text{SO}_4 \cdot 10\text{H}_2\text{O}$, occurring in the United States in Arizona, California, Oregon, Wyoming. Used to some extent for manufacture of soda.

MIRACLE PLAYS. The earliest dramatic representations of religious themes grew up within the Church itself. At certain seasons of the year, tableaux of gospel scenes were shown to the people, a practice which still survives in the representations of the Nativity in modern Catholic churches. The introduction of action and music into these tableaux is easy to understand, particularly in view of the dramatic elements in the celebration of the Mass, and in the ritual for special occasions, like the consecration of a church. Tropes or simple texts set to music were added to the regular service, and gave a further opportunity for dramatic scenes. In time these tropes grew more elaborate, passages in the vernacular were introduced and popular elements not taken from the Bible were added. Meanwhile, the little plays, which in the beginning had been given in the choir, were transferred to the nave, and set up against the pillars. So popular did these representations become, and so great was the concourse of spectators, that a move outside the building into the churchyard had to be made. Secular elements crept in very rapidly, and the plays were finally transferred to open spaces in the cities and towns. The liturgical drama reached its height in the 13th century; by the beginning of the 14th century it had largely passed out of the hands of the clergy, although representations continued to be given in many churches.

The growth of the miracle play in England is due to the influence of the Normans. There are almost no evidences of dramatic impulse in England before the Conquest. The earliest play of which there is mention by name is a *'Play of Saint Katherine,'* at the beginning of the 12th century, produced under the direction of a Frenchman who afterward became abbot of Saint Albans. To the same century belongs the work of Hilarius, a pupil of Abelard, and perhaps of English birth. He wrote Latin plays on subjects taken from the Scriptures, and diversified them with refrains in Old French. It seems probable that French plays may have been acted in England at this time, but none are extant.

The term *'miracle play'* is properly applied to the religious plays which developed in England out of liturgical beginnings. They have sometimes been called *'mysteries,'* but this term, which is more generally and rightly used of productions in France, does not antedate the 18th century in England, the mediæval name being *'miraculum,'* or *'miracle.'* A great impetus was given to the plays by the institution of Corpus Christi Day, with its elaborate processions and outdoor ceremonial, and many came to be presented at this season, when the conditions of weather were likely to be favorable. In time the procession served as a mere preliminary to the dramatic performances to follow. A desire for more elaborate stage effects and a greater

number of incidents within the plays was constantly increasing, until there developed out of the relatively simple early pieces long groups of plays of cyclic character, covering the principal events of the Scripture narrative, in both the Old and the New Testament. The series given at York in 1415 begins with the Creation, and ends with the glorification of Mary and Jesus in heaven, embracing 48 separate pieces in all. These cycles were often not all given on one day, but extended over two or more days, or they were divided, and presented in succeeding years.

After leaving the churches, the plays soon passed into the hands of the guilds, or associations of tradesmen. In the 13th century clerics were forbidden by papal edict to appear on the stage, but these prohibitions were frequently disregarded. The control of the plays by the guilds marks a period of great importance in the history of the English drama. Much care was devoted to the production and acting of the various pieces. The corporation of the city had general charge of the matter, deciding when the performances should be given, and dividing the various scenes among the several companies. An effort was made to have the play suit the character of the guild that gave it; the shipwrights showed the building of the Ark, the waterman the Flood, and so forth. The plays were given on movable stages called *pageants*, which consisted of "high scaffoldes with two rowmes," one beneath which was used as a dressing-room, and one above, open on all sides to give a better view, and occasionally provided with a canopy. These wagons moved from place to place, repeating the performance at different stations. The number of these stations varied with the size of the town; there were sometimes a dozen or more. The pageant wagons were gaily painted and decorated. They were generally rectangular, but special shapes were required for the Ark, or for Hell-Mouth, a huge painted head with open jaws belching fire and smoke. The scenery was of a rude sort. Palaces, temples and castles were sometimes represented by boxes or wickerwork covered with cloth. Occasionally the actors made use of the open space in front of the pageant; Herod's "raging" appears to have been partly done in the street. The costumes were often expensive, but frequently grotesque. Herod was attired like a Saracen, with red gloves. Pilate always wore a green cloak and wielded a huge club. God the Father was represented in person, and dressed all in white, with a gilt wig. The devils and the Evil One were made very realistic, and came to furnish a great deal of low comedy. Various accounts of sums paid for properties and costumes are still preserved.

Four cycles of miracle plays are still extant, the York, Chester, Coventry and Towneley or Woodkirk plays. The Towneley series, so called from the family who long owned the manuscript, much resembles the York cycle, and like it displays much vigor and humor. The Chester plays perhaps appeal most to modern taste. The religious passages are more reverent, the humor less coarse and the versification less harsh. The Coventry plays are full of didacticism, and this, with the introduction of personified abstractions, relates them more closely than the others to the *Moralities*. Fragments of other cycles

have also survived. The Vulgate and the Apocrypha are the chief sources of the texts. In places some tragic elevation is reached, marred, however, by repetition and moralizing. Melodramatic and ranting scenes were popular. The comic scenes are often very spirited, and clearly based upon observation of the life of the people. Anachronisms are common, and the supernatural is treated with great naïveté.

The miracle plays were at their best in the time of Chaucer. In the 15th century the *Moralities* arose to compete with them for favor, but never equaled them in dramatic achievement. The miracle plays continued to be given until the beginning of the 16th century, but in the reign of Elizabeth they had ceased to be a vital force. Their influence in preparing the way for the Elizabethan drama was very great, however. They introduced elementary types of comedy and tragedy, farce and melodrama, and accustomed the people as a whole to dramatic conventions. They made a national drama possible in the time of Shakespeare, and kept the theatre from being a mere amusement for the nobility, or a diversion for a small group of literary people.

WILLIAM WITHERLE LAWRENCE,
Professor Emeritus of English, Columbia Univ.

MIRACLES, works which excite wonder, because they are beyond ordinary human experience and appear to contravene the known laws of nature.

The well-known argument of Hume against the credibility of a miracle has often been refuted. A miracle, he said, was contrary to experience, but false witnesses in history are not contrary to experience; it is less probable that the miracle is true than that the witness is false. There are two fallacies in this reasoning; it begs the question by the use of the words *contrary to experience*, for the point at issue is

whether miracles are contrary to experience or no. If they are contrary to Hume's experience, may it not be because his experience is limited? He has not lived at an age when a new religion was instituted and extraordinary guarantees demanded in order to accredit it with a hostile world. Even mankind's experience in nature is becoming widened every year, and many wonderful things take place at this moment which our ancestors of a century ago would have looked upon as magical or miraculous, such as wireless telegraphy, communication by telephone, the effects of the Roentgen rays, the power of radium, etc. For miracles are not to be looked upon as a violation of the laws of nature, but merely as the interposition of a higher law overruling a lower one. To those who believe in an intelligent creator and conservator of the world there can be no difficulty in apprehending the possibility of the miraculous; even those who like Herbert Spencer have a vague belief in what they style Force or Power underlying all the operations of nature should not hesitate in admitting that the force which keeps up the multitudinous activities of the universe may manifest itself at times in unprecedented fashions, even as the new discoveries and combinations of science are constantly revealing new powers in the domain of natural law.

Pascal has said that the certainty and genuineness of certain miracles is proved by the falsity of others, meaning presumably that the very fact that general human consent has been given to the idea of miracles proves that such idea has a counterpart in reality. There are of course certain concomitant circumstances which may be taken as affecting the credibility of a miracle. Most of the miracles of history may be put aside as inventions; such are many of the stories told by Livy and Herodotus, and the wild fables of Hindu history, as well as many miraculous incidents in the life of Mohammed. Christian apologists lay particular emphasis on the moral aspects of the miracle. To those who deny or doubt the existence of a supreme being, the moral ruler of the universe, a miracle is an impossibility. On the other hand, without miracles the revelation of God is impossible. Hence, a miracle with a moral object is most in accordance with the character of a Supreme Being governing the world with a moral end. All idle or superfluous miracles are to be rejected as at variance with the character of such a being. Equally to be rejected are miracles which are merely tentative, that is, sometimes successfully accomplished, sometimes ending in failure; as well as others which are doubtful in their nature and those which are merely exaggerations of natural events.

In the early Church those who defended Christianity against the attacks of those outside laid great stress on the evidence of miracles, and claimed that miraculous power still existed among Christians. Irenæus asserted that this power was universal among Christian churches. Saint Augustine asserts the reality of the miraculous on the testimony of his own experience. He makes the acute remark that a miracle is not contrary to nature but to what we know of nature. The schoolmen did not agree with Augustine on this point. Thomas Aquinas defines a miracle as "something out of the order of nature." Albertus Magnus

declares that God has implanted the possibility of miracles in the very nature of things, although denying that he can do anything contrary to nature. Luther puts the miracle of grace in the heart far above any physical miracle, while he assigned the Bible miracles their proper place in the development of the faith. The Roman Catholic Church has always claimed the existence of miraculous powers and continues to do so to this day. The Socinians and Arminians maintain that God has always revealed himself by means of supernatural works, and Grotius in his defense of Christianity makes miracles the foundation of his argument. There has always, however, been a school of rationalists or philosophers who have opposed or attacked the belief in miracles, although Leibnitz admitted this belief into his philosophical system. He defines a miracle as an event inexplicable by natural causes. The laws of nature, he says, are not necessary and eternal; God can for his own purpose suspend them; the miraculous is included in the divine plan and forms a part of "the pre-established harmony." Spinoza made the statement that miracles are impossible. In his pantheistic philosophy nature and her laws are identical with the will, intelligence and nature of God, who cannot work contrary to the laws of material nature. Kant like the English Deists did not deny the possibility of miracles, for they might be wrought by powers and in accordance with laws of nature with which we are unacquainted, but believed that such laws were never exercised. Schleiermacher contests the apologetic value of miracles and endeavors to eliminate the miraculous from the Christian scheme, which he thinks is lowered by this supernatural element. The modern agnostic claims that the advance of science has made a belief in the miraculous impossible. Some have tried to explain the recorded miracles of Scripture by a reference to natural causes; others would treat them as allegories or legendary accretions or folktales, or attribute them to self-deception, or fraud, or the credulous exaggeration of bystanders and witnesses. Miracles are regarded by conservative theologians as an essential part of Christianity which cannot be explained away or eliminated without destroying its authority. The more advanced theologians claim the right to question the reality of miracles, even including the virgin birth of Christ and the resurrection, and they regard as the matter of supreme importance the fact that Christ spiritually still lives and is transfiguring the life of mankind. Certain it is that miracles no longer hold the place they once did as Christian evidences; conversion, the "expulsive power of a new affection" vivifying and transforming the soul, the divine response to prayer, communion with God and the supreme miracle of Christ himself as the spiritual regenerator of mankind—these have placed outward signs and evidences into a subordinate place.

J., 'Foundations of Belief' (1895); Bonney, T. G., 'The Present Relation of Science and Religion' (ib. 1913); Bruce, A. B., 'The Miraculous Element

in the Gospels (London 1886); Wright, Charles J., *Miracle in History and in Modern Thought* (New York 1930).

MIRAGE, mī-rāzh', an optical illusion produced in the atmosphere by an unusual refraction (q.v.) of light rays. The illusion may result in the appearance of a distant object floating in mid-air, or projected transparently against a ground or sea surface where the object does not physically exist. Often, complex inversions and distortions of the mirage image cause it to assume weird shapes (see FATA MORGANA).

The basic cause of a mirage is the bending of light rays from a distant object as they pass the boundary or interface between two layers of air having sensibly different densities. The difference in density is usually caused by an unequal distribution of temperature, as when the layer of the atmosphere closest to the ground is heated from below by intense reradiation of the sun's

Fig. 1. Inferior mirage.

rays from the ground. For this reason, mirages are more frequently seen over deserts and wherever temperature inversions are found. Stratification of the atmosphere is necessary for a mirage to occur.

Since light rays are bent upward in entering obliquely into a stratum of air of lesser density, the image of an object seen under these conditions is in an inverted position below and apparently in front of the object. This is known as an *inferior* mirage. The appearance of a spurious lake on the desert, or an incongruous film of water over a portion of the highway ahead on a clear hot day, are typical examples of inferior mirages. These phenomena occur only under conditions where, in the lowest few feet of the atmosphere, the air is superheated and substantially

Fig. 2. Superior mirage.

less dense than the air above it. The apparent pool of water is but a refracted and shimmering image of the clear sky above (see Fig. 1). Light rays from a point *S* in the sky are curved upward by refraction so that an image of a patch of the sky is formed at a point directly beneath, and seems to originate in a point *S'* below the ground. The glistening, waterlike image of the sky thus appears as if reflected from the ground at a point *I*, where the line of sight from the observer *O* intersects the ground in front of the apparent source *S'*.

Conversely, if the light rays from a distant object are refracted downward on entering a cold air mass having greater density, the apparent position of the object is elevated above its actual position (see Fig. 2). If the density transition is

marked, the image of an object on the ground may be projected upward against the sky in a phenomenon known as a *superior* mirage ("looming"). When a strong temperature inversion occurs some 30 feet above the surface, as is common over quiet bodies of water, a superior mirage is frequently formed. Because of this stratum of abnormally warm air overlying a stratum of cold air, many complex refractions resulting in both erect and inverted images, and fragments thereof, are possible, depending upon the height of the observer and his angle of vision with respect to the refracting layer.

As an optically real, though physically illusory phenomenon, a mirage can be photographed.

FERGUS J. WOOD.

MIRAMICHI, mīr-ā-mī-shē' (Indian "happy retreat"), river, New Brunswick, Canada, formed by several streams flowing east or northeast and joining to enter Miramichi Bay on the Gulf of St. Lawrence. The main stream, the Southwest Miramichi, is 135 miles long. Newcastle and Chatham are the chief towns on the lower river.

MIRAMON, mē-rā-mōn', **Miguel**, Mexican soldier and politician: b. Mexico City, Mexico, Sept. 29, 1832; d. Querétaro, June 19, 1867. Educated at a military school in Chapultepec, Miramón fought in the Mexican Army against the United States in 1847, and by 1855 had risen to the rank of colonel. The next year he took part in two unsuccessful revolts at Puebla against the moderate liberal provisional president, Ignacio Comonfort. When the War of the Reform began in 1858, he joined Gen. Félix Zuloaga as leader of the Conservative faction against the Liberals, led by Benito Juárez. Miramón was chosen by the Conservative junta to succeed Zuloaga as president in February 1859, but was defeated at Capulámpam (Dec. 22, 1860) by Jesús González Ortega, Juárez' general, and fled to Cuba and then to Europe. There he became involved in Napoleon III's plans to invade Mexico, and returned to his native land with Maximilian in 1862 as a grand marshal. From 1864 to 1866 he served as minister to Berlin. When Maximilian's army was finally defeated by Juárez at Querétaro (May 14, 1867), Miramón was taken prisoner and later shot, along with the emperor.

MIRANDA, mē-rān'dā, **Francisco de**, Venezuelan precursor of South American independence: b. Caracas, Venezuela, March 28, 1750; d. Cádiz, Spain, July 14, 1816. As an officer in the Spanish Army he fought in North Africa and then volunteered for service in the Western Hemisphere, where he played a part in the American Revolution. Miranda received the surrender of the British at Pensacola, Fla.; cooperated in the capture of New Providence in the Bahamas; and after Admiral François de Grasse had captured Tobago (1781), helped him re-equip and provision his fleet for the voyage to Chesapeake Bay, thus contributing to the decisive Franco-American victory at Yorktown. Angered at the arrogant attitude of the Peninsular Spaniards toward colonials, Miranda sailed to the United States. It was in New York (1784) that, according to his own testimony, he formed "a project for the liberty of the entire Spanish-American Continent with the cooperation of England." By this time he had made the acquaintance of almost every important United States leader.

After 18 months in North America, the Venezuelan patriot sailed for England. During a six-month stay in London he made friends, heard debates in the House of Commons, and wrote articles about the prospects for freedom in South America. Then, to complete his "imperfect education," he also traveled widely on the Continent. In Russia he became so much a favorite of Catherine II that, after his return to London, he was granted the protection of the Russian embassy there. At a conference with Prime Minister William Pitt, plans were discussed for liberation of the Spanish colonies in America. In 1792, however, Miranda became interested in the French Revolution and in September 1793, as a general of division, served under Charles François Dumouriez on the historic field of Valmy. Another victory, this time at Antwerp, was followed by a debacle of the Republic's armies at Neerwinden. Tried on charges of treachery for this defeat, the Venezuelan was acquitted triumphantly. When Napoleon won control of France, however, Miranda returned to London and, renewing his friendship with Pitt, maintained contact with numerous agents in the Americas. In 1806 his first expedition to Venezuela, organized in New York with the alleged connivance of American authorities, ended in complete failure.

Napoleon's invasion of the Iberian Peninsula (1810) set the stage for uprisings in Hispanic America. On April 19, the patriotic forces in Venezuela decided to disown the distant Madrid regency. This was the signal for Miranda to return to his own land. After eloquent speeches by Miranda and Simón Bolívar, the first republic in South America was proclaimed in Caracas on July 5, 1811. When royalist armies threatened to destroy the young republic, Don Francisco was elected generalissimo and virtual dictator; but due to disunity and the fall of the fortress of Puerto Cabello, the Venezuelan leader was forced to capitulate, July 25, 1812. Trapped by the Spaniards in the port of La Guaira, Miranda was transported a prisoner to Cádiz where he died on the anniversary of the fall of the Bastille.

Consult Robertson, William S., *The Life of Miranda* (Chapel Hill, N.C., 1929); Thorning, Joseph F., *Miranda: World Citizen* (Gainesville, Fla., 1952).

JOSEPH F. THORNING,
Advisory Editor of "The Americas."

MIRANDOLA, mē-ran'dō-lā, commune, Italy, in Modena Province, Emilia-Romagna Region, 18 miles northeast of Modena. Its records go back to 1102, when the first fort was probably built. Until 1710 it was the seat of the Pico family, of which the humorist, Count Giovanni Pico della Mirandola, was the most famous member. It is a cathedral town and a rail terminus, and manufactures canned goods, macaroni, hemp products, shoes, and chassis trucks. Pop. (1951) 24,234.

MIRBEAU, mēr-bō', Octave (Henri Marie), French novelist and playwright: b. Trévières, Calvados, France, Feb. 16, 1850; d. Paris, Feb. 16, 1917. Educated at a Jesuit school at Vannes, of which he later wrote bitterly in *Sébastien Roch* (1890), Mirbeau became dramatic critic on *L'ordre*, and a founder of the satirical paper *Les grimaces*. His political ideas were often unpopular, but he was influential in attracting favorable attention to contemporary painters and writers, and was an early defender of Capt. Alfred Dreyfus (q.v.).

His stories of the peasants of Normandy, where he was born, were well received in 1886, and he published several novels. In 1897 his *Les mauvais bergers*, a five-act drama, was played by Sarah Bernhardt. His most successful play, *Les affaires sont les affaires* (1903), was produced in New York as *Business is Business* (1905).

MIRFIELD, mūr'fēld, urban district, England, in the West Riding of Yorkshire, on the Calder River and canal, 4 miles northeast of Huddersfield. It is a railroad junction, and an important cotton and woolen milling town, making carpets and blankets. Pop. (1951) 11,885.

MIRIAM, mīr'ī-ām, in Biblical history, the sister of Moses and Aaron, first mentioned (Exodus 2:4-10) as being stationed by her mother to watch her brother Moses' cradle among the rushes on the riverbank. In Exodus 15:20-21, Miriam is called "the prophetess," and leads the women in a song of rejoicing over the safe crossing of the Red Sea. Later (Numbers 12) she rebuked Moses for his marriage with an Ethiopian woman, and for this was stricken with leprosy, but the curse was removed. She died after the wandering in the desert, and was buried in Kadesh.

MIRKHOND, mēr-kōnd', (Pers. MIR-KHVAND; properly MUHAMMAD IBN-KHAVAND SHAH IBN-MAHMUD) Persian historian: b. 1433; d. 1498. A direct descendant of Mohammed, he devoted his life to collecting all the available material on the lives of the important men of Persia. The work he produced, *Rauzat-us-Safā* (*Garden of Purity*), is considered one of the world's masterpieces. In seven volumes, with a geographical appendix, it contains the biographies of prophets, kings, and caliphs from remote times to 1523. The final volume was probably written by Mirkhond's grandson, Khvandamir (1475-1534). The work was partially translated by E. Rehatsek in five volumes (1891-1894).

MIRO, mē-rō', Joán, Spanish painter: b. Montroig, near Barcelona, Spain, April 20, 1893. After studying art in Barcelona, where he had his first exhibition, Miró went to Paris. His 1921 exhibition received favorable attention from contemporary artists, and in 1922 *The Farm* in cubistic style, was hailed as a masterpiece. The surrealists accepted his 1926 painting *Dog Barking at the Moon*, as an example of their art, but at an exhibition in New York in 1940, critics were divided in classifying his work. His style is one of fantasy, with recognizable forms, but not purely representational. The Museum of Modern Art in New York owns several of his works.

MIRO FERRER, Gabriel. See SPAIN—
11. Literature (The 20th Century).

MIRROR, a smooth surface usually of glass, capable of regularly reflecting rays of light. A mirror may be (1) a polished surface of glass; (2) a surface of tin foil on the further side of a sheet of glass, as in the common looking glass; (3) the surface of a film of silver or platinum deposited on a polished glass surface, so that rays of light to and from the metallic reflecting surface do not pass through the glass; (4) a polished surface of silver, gold, platinum, or speculum metal.

The earliest mirrors were probably man's

own reflection in the still water of ponds and lakes. The use of mirrors of brass by the Hebrews is mentioned in the Pentateuch; and bronze mirrors were used by the Egyptians, Greeks and Romans. The use of silver in the manufacture of mirrors was taught by Praxiteles in the 4th century before Christ. Looking glasses were first made in Venice in A.D. 1300, and in 1673 were introduced into England. They were a great improvement on the more ancient speculum metal mirrors, whose reflecting surfaces were liable to oxidation from exposure to the air, but they have the disadvantage that there are two reflecting surfaces, one of glass, the other of metal. Polished metals reflect nearly all rays of light at all incidences; glass reflects very few rays at the normal incidence, but the amount of reflection becomes greater and greater as the incidence becomes more and more oblique. Mirrors are usually either "plane" or "spherical." Spherical mirrors are small portions of the surface of a sphere. In a spherical mirror, concave or convex, the line through the centre of the spherical surface of which the mirror is a part and the middle point of the mirror is called "the axis." From a concave mirror rays parallel to the axis converge after reflection to a point called the "principal focus," which is half-way between the centre of the sphere and the mirror. (See LIGHT). Rays from a luminous object outside the spherical centre of a concave mirror form a small, real, inverted image of the object between the centre and the principal focus; when the object is between the centre and the principal focus the image is beyond the centre, and is large, real and inverted.

Prior to 1835 mirrors were almost universally made by applying a coat of tin-foil amalgamated with mercury to the surface of plate-glass. In 1835 Baron Liebig observed that on heating aldehyde with an ammoniacal solution of nitrate of silver in a glass vessel, a brilliant deposit of metallic silver was formed on the surface of the glass. To this observation the more recent process of silvering glass is really due. In 1849 Drayton made known a method in which he employed as a backing composition two ounces of nitrate of silver, one ounce of ammonia, three ounces of alcohol and three ounces of water. The defects of these two modern processes are that the deposit of silver on glass is not so adherent and unalterable under the influence of sunlight and sulphurous fumes as the old amalgam of tin and mercury; besides, the newer processes give the glass a slightly yellowish tinge. These disadvantages have been obviated by applying to the silver coating a weak solution of cyanide of mercury, which immediately forms a kind of amalgam and renders the deposit at once much whiter and more adherent. The silvering is protected from mechanical abrasion and the chemical action of gases and vapors by a coating of shellac or copal varnish, which when dry may receive a further covering of red-lead paint. A method of coating glass with platinum has been recently introduced. A solution of bichloride of platinum is spread over the surface of the glass with a fine brush, and the metal is precipitated with oil of lavender. As this summary process produces a somewhat gray lustre it is used only for cheap mirrors, the lids of ornamental boxes, toys and the like.

MIRROR CARP. See CARP.

MIRROR OF KNIGHTHOOD. The Spanish romance of chivalry. It was one of the books in Don Quixote's library and of it the priest said to the barber: "In this same 'Mirror of Knighthood' we met with Rinaldo de Montalban and his companions, with the Twelve Peers of France and Turpin the historian. These gentlemen we will condemn only to perpetual exile, as they contain something of the famous Bojardo's invention, whence the Christian poet Ariosto borrowed the groundwork of his ingenious compositions; to whom I should pay little regard if he had not written in his own language (Italian) 'The Mirror of Knighthood' is identified with the 'Cavallero del Febo' (Knight of the Sun), a romance belonging to the Amadis de Gaul Cycle. It seems to have been the work of several hands and was unfinished. An English translation was printed in 1578.

MIRROR FOR MAGISTRATES. The. This once popular work, the first part of which was published in 1555, and the last in 1620, was the result of the labors of at least 16 persons, the youngest of whom was not born when the oldest died. It probably owed its inception to George Ferrers, master of the king's revels at the close of the reign of Henry VIII; and he associated with himself William Baldwin. Richard Niccols is responsible for the book in its final state; and in the interim, it was contributed to by Thomas Newton, John Higgins, Thomas Blennerhasset, Thomas Chaloner, Thomas Sackville (who wrote the poetical preface called the Induction and the life of Buckingham), Master Cavyll, Thomas Phaer, John Skelton, John Dolman, Francis Segar, Francis Wingley, Thomas Churchyard and Michael Drayton. It is a "true Chronicle Historie of the untimely falles of such unfortunate princes and men of note, as have happened since the first entrance of Brute into this Iland, until this our latter age." It was patterned after Lydgate's 'Fall of Princes,' a version of Boccaccio's poems on the calamities of illustrious men, which had been very popular in England. The stories are told in rhyme, each author taking upon himself the character of the "miserable person" represented, and speaking in the first person. The first one told by Ferrers is that of Robert Tresilian, chief justice of England.

MIRROR OF PERFECTION. The, is a most intimate and exceedingly illuminating account of the son of Peter Bernardone, cloth merchant of Assisi. Christened John he was nicknamed by his father "Francisco" and is known to the world by no other name than that of Saint Francis of Assisi.

The volume, small enough to be attractive—there are only about 50,000 words to it—was written by Leo of Assisi who is often spoken of as the "beloved disciple" of Saint Francis. "Brother Leo, was not merely a fellow-townsmen, 'companion,' disciple, and dear friend of Francis of Assisi. He was also his sick-nurse, secretary and confessor during the last six years of his life. None knew Francis so intimately, or remembered him so well. None could be more scrupulously conscientious in recording what he believed to be the exact truth about the not yet canonized Saint." The character and fashion of the record tempts one

to speak of him as St. Francis's Boswell. It is the "oldest life of the Beloved Francis," being done," so a note at the end of the volume informs us, "in the most holy place of S. Mary of the Little Portion, and completed this fifth of the Ides of May in the year of Our Lord 1228." St. Francis died Oct. 3, 1226.

The significance of the title is disclosed in these words of the author: "Here endeth the Mirror of Perfection of a brother Minor; to wit, of the Blessed Francis, wherein we may most sufficiently behold as in a glass the perfection of his calling and profession." Without a doubt a less scrupulous writer would have said also the perfection of the life of the Blessed Francis. He refrained from saying this most likely because he knew that St. Francis would most flatly resent being spoken of as perfect.

The style in which the book is written is singularly in keeping with the spirit and character of the subject, and of the type of life he represented—simple, direct, homely, shorn of all scholarly vanities and conceits as the life of the subject was shorn of all worldly comforts. There is an indescribable charm and power of revelation to this narrative that is simple and homely even almost to the point of bluntness. Narrative is hardly the correct word. Perhaps it is better described as "a chaplet of immortelles set upon the head of the Saint on the morrow

his death to typify the crown of glory achieved by this beatified Spirit."

It is hardly a disinterested picture or biography. Some of it has been written with a distinct purpose, the intent being to show not merely what kind of a man St. Francis was and the kind of life he lived but what principles and "Rules" he laid down as the foundation of the famous order which takes its name from him, and it is plainly also the purpose to show what obedience to these principles is the true path of the perfect Christian. Sometimes Brother Leo becomes controversial, taking vigorous issue with those, and they were many, who "desired to ignore certain of the wishes and to modify certain of the injunctions of Francis in what they believed to be the interests of the Order." All this, however, does not lessen the value of the book as a carefully drawn and wholly reliable picture of the founder of the order of Franciscans. By his scheme of minutely, yet briefly, telling what St. Francis did on those occasions when it seemed best that by example he should make clear to those concerned what doctrines he believed should govern their conduct, and of repeating what reply was made to those who came to St. Francis seeking information or to question his ideals, the author gives the reader a very impressive picture of this noted religious character. With the devotion of one who is wholly of the same mind and spirit as the subject of his writing, Brother Leo with painstaking accuracy repeats in "what wise the Blessed Francis declared the will and intention which he had from the beginning to the end as regards the observance of poverty" and of "maintaining poverty in books, and beds, buildings and appliances," and "how he did induce and teach his brethren to go forth for alms," thus disclosing what manner of man he was. He recounts instances showing with what unswerving zeal St. Francis carried out to the very limit of perfect example his ideals of absolute poverty in all things, of humility, charity, compassion and con-

descension. There may be much more to the life of the Blessed Francis than is here given, but the author has without doubt in these pages pictured Francis in the fashion in which he most desired to appear before his fellow-men. It is a book one must read if he would know the real St. Francis and appreciate the ideas and ideals which moved him to fashion his life after the manner of the rules he made for the order that grew up about him.

MIRYACHIT, mēr-yā'chīt, a peculiar nervous disease prevalent in Siberia and some other countries, the chief characteristic of which is mimicry by the patient of everything said or done by another person.

MIRZA, mēr-zā', a title of honor in Persia.

MIRZA HUSAYN ALI (BAHAULLAH), Persian religious reformer: b. Mazadran, Persia, Nov. 12, 1817; d. Acre, May 29, 1892. He was of noble family, joined the Bahai movement in 1850 and was imprisoned during the fierce political and religious persecutions which the sect suffered shortly after the death of Mirza Ali Mohammed. (See *BAHAI FAITH*.) His property was confiscated and he himself, with his family, was banished from Persia to Baghdad (Turkey) in 1852. Many Bahais followed him, most of them fleeing from the fierce persecution at home. Mirza Ali organized these into a compact, well-governed and self-sustaining community which soon became wonderfully prosperous, growing steadily in wealth and numbers. He was early looked upon as the great leader foretold by the founder of the faith; and new adherents came from all over Asia to study under him or to join the colony in Baghdad. This prosperity of the colony and the popularity of Mirza Ali, the "Bab" (gate or door), excited the jealousy of the Persian government and church, and the prophet and the whole colony were extradited and brought back to Constantinople. During the exodus, Mirza Ali proclaimed himself the expected prophet and took the name of Bahaullah (Splendor of God), by which designation he has ever since been known among his followers (1864). As the Bahai movement continued to grow with great rapidity in Constantinople, Mirza Ali was banished to Adrianople. Thousands of the faithful followed him there and he was removed to Acre (Palestine), a Turkish penal settlement, with 70 of his most active disciples (1868). They were all subject to the most rigorous imprisonment and treated with great harshness for seven years. At the expiration of this time the Bahais were allowed to form settlements in the town of Acre. To these settlements came people of all sects and creeds, and the penal colony became the center of an intense religious movement which proclaimed the brotherhood of man, the unity of the race and the identity of all true spiritual aims and thought. There Mirza Ali remained from 1868 to 1892, writing his doctrinal books, working out plans for the government of the society and studying moral, social, political and economical questions and applying the lessons thus learned to the illustration of the gospel of the unity of mankind, of religion, of society and of government. He boldly attacked the problems of the day and attempted to solve them through the application of his own religious views. Among

the works of Mirza Ali are *The Hidden Words*; *The Most Holy Book*; *The Book of Certainty* and *The Seven Valleys*.

MIRZAPUR, mīr'zā-pūr, city, India, in the Benares division of the United Provinces. Mirapur, signifying the Prince's Town, is on the right bank of the Ganges, 45 miles east-southeast of Allahabad. It presents an imposing appearance from the river, with fine ghats leading down to it, and numerous mosques, temples and handsome European houses occupying some of the most conspicuous sites, but the interior is disappointing. It has a large mart for grain, cotton and other raw produce, but with the railway era and the rise of Cawnpore to commercial importance, much of its trade has migrated elsewhere. Shellac, brassware and carpets are manufactured. There are imports of grain, sugar, cloth, metals, fruit, spices, tobacco, lac, salt, and cotton; and exports of the same articles. Pop. (1941) 70,944.

MISAMIS, mē-sā'mēs, former province along the coast of Mindanao, Philippine Islands. In 1939 it was divided into Misamis Occidental and Misamis Oriental (qq.v.). Before 1818, when it was made a separate province, it was a part of Cebu Province.

MISAMIS OCCIDENTAL, ōk-sē-thān-tāl', province, Philippine Islands, on Mindanao. It is west of Iligan Bay, and northeast of Zamboanga Province, and it is separated from Lanao Province in the northwest by Panguil Bay. The terrain of the province is mountainous, the highest peak being Mt. Malindang (7,956 feet). Corn and coconuts are produced. The chief towns are Oroquieta (the capital), Tangus, Jimenez, Ozamiz, and Plaridel. Misamis Occidental was originally a part of Misamis (q.v.), but was made a separate province in 1939. The area is 802 square miles; pop. (1948) 207,575.

MISAMIS ORIENTAL, ō-ryān-tāl', province, Philippine Islands, on Mindanao. It is a long coastal strip east of Iligan Bay. It includes Camiguin Island, in the Mindanao Sea. Augusan Province is on the east and Lanao Province on the southwest. On Camiguin Island is the volcanic cone, Hibokhibok (5,620 feet). The soil of the province is fertile, and the chief products are hemp, fish, and coconuts. There are chromite deposits in the vicinity. The chief towns are Cagayan (the capital), Balingasag, Mambajao, and Initao. The province was formed in 1939 from a portion of Misamis (q.v.). The area is 1,512 square miles; pop. (1948) 369,671.

MISANTHROPE, *Le*, lē mē-zān-trōp', a comedy of Molière in five acts in verse, presented for the first time in the Theatre of the Palais-Royal, June 4, 1666, when the author was 44 years old, Molière played the title role and his wife the part of Célimène. This play, which is Molière's nearest approach to tragedy, concerns one Alceste, who rails at the insincerity of mankind and yet is in love with a coquette, Célimène—a stroke which art is incapable of without genius. Alceste excites at once our admiration, pity and laughter. An upright and sincere man even to an unreasonable degree, he is made miserable by a letter of Célimène which seems to justify his right-

eous indignation. Notwithstanding that these fears seem to be well founded, Alceste remains in love with Célimène, but wishes her to withdraw with him from human society—which she, of course, refuses to do. The splendid emptiness of the life in a Parisian salon of the 17th century is placed vividly before us. There is no place for a natural and honest character in such society. Everything is artificial, deceptive and shallow. Molière's own experience had been so painful that the accent of truth pervades his treatment of the character which so nearly resembled his own. His life, saddened by hostile criticism, ill-health and an unhappy marriage, had become embittered, and some have attempted to prove therefrom that Molière himself is the real Alceste. It is true that he revealed more of his real self in this play than in any of his other plays, but he was too much of an artist to depict merely his own character. His unhappy domestic life probably did influence him to some extent, but the germ of the play is to be found in his earlier but unsuccessful play, *Dom Garcie de Navarre* (Feb. 4, 1661), from which he borrowed freely both scenes and verses. The duke de Montausier, the character of Mégabate in Mlle. de Scudéri's *Le Grand Cyrus* and Boileau may also have been, as has been claimed, in Molière's mind in his delineation of Alceste. As a foil for the rigorous Alceste, the author presents us with the indulgent Philinte, who bears with men's faults from the necessity of living among them. So likewise with the coquette is contrasted the virtuous Éliante. The prude Arsinoë, and the marquis, typical of the large class of nobility whom Molière suspected of using their influence at court against him, constitute the other principal characters. Sheridan has imitated a scene of *Le Misanthrope* in his *School for Scandal* and Wycherley has imitated the entire play in his *Plain Dealer*, in a comparison between the imitation and the original the difference is seen between genius and brutality. The idea behind *Le Misanthrope* may perhaps be best rendered in the words of Philinte: "All these human defects give us opportunity in life of exercising our philosophy. 'Tis the most amiable employment virtue finds; and if every place were full of honesty and all hearts were frank, just and docile, the greatest part of our virtues would be useless to us, since the use of them is placed in this, in the power of bearing the injustice of another in respect to our property, without being ruffled." From this it is evident that Molière in his characterization does not discredit virtue, as such critics as Rousseau and Fénelon claimed, but merely the austerity of virtue not tolerant enough of human weakness. The public of the time was not prepared for such a fine distinction and did not appreciate the humor which reigns throughout. Consequently, in spite of its purity and elegance of style, the play was coldly received. It is said that at the first presentation, after the reading of Oronte's sonnet, the pit applauded, but Alceste afterward in the same scene contend that the sonnet was mere trash, whereupon the audience, through embarrassment at having approved it, became prejudiced against the entire play. Subsequently, it has become to be almost universally acknowledged as the most perfect piece of French comedy and the masterpiece of

Molière. There is an extremely clever translation of 'Le Misanthrope,' with the French text *en regard*, in the fourth volume of the works of Molière published by John Watts (London 1748).

HERBERT F. WRIGHT.

MISCARRIAGE, literally a failure, a going astray. I. A miscarriage of justice is a failure of the law to attain its ends; or a breach of legal duty. Such is the significance of the term as employed in the fourth section of the English Statute of Frauds and in similar statutory provisions in the United States. II. Miscarriage in medical jurisprudence is employed in the sense of abortion (q.v.).

MISCEGENATION, from the Latin *miscere*, to mix, and *genus*, race, a mixture of races. The word is usually applied to the amalgamation of the white and negro races in America, and came into general use toward the middle of the 19th century, when certain publicists advocated absorption of the blacks by intermarriage with whites. Consult Davenport, 'Heredity of Skin Color in Negro-White Crosses' (Washington 1913); Estabrooke & McDougale, 'Mongrel Virginians' (Baltimore 1926). See MIXED RACES.

MISCHIANZA, *mīs-ke-ān'tsa*, The, in American history, an entertainment given in Philadelphia, 18 May 1778, during the war of the Revolution, by officers of the British army, in honor of Sir William Howe, about to return to England after his supersession. The entertainment was given at the country home of Thomas Wharton and comprised a dinner, dancing, a regatta, mock tournaments and various games. Major André was prominent in planning the entertainment. Consult Sargeant's 'Life of Major André' (New York 1902).

MISDEMEANOR, *in law*, any offense below felony; the least offense by English common law: In the United States, the different States vary widely in defining misdemeanor, so that what is misdemeanor in one State may be indictable felony in another. Among the offenses commonly classed under this heading are malicious mischief, assault and battery, etc.; criminal proceeding on such charges may be dropped, in many States, if the injured party acknowledge satisfaction, which suggests a distinction between felony. The historic line between the two classes of offenses was based on the outcome of conviction; in the case of felony the convicted person forfeited his property, real and personal, if the felony was capital, personal only if the felony was not capital. But no forfeiture of property ensued upon conviction for misdemeanor.

MISE OF AMIENS, *mēz*, *ov a'mē-ān'*, (*mise*, Anglo-French term meaning judgment, from the French *mettre*, to place), is the name given to the decision of Louis IX of France in the controversy between Henry III of England and his barons (23 Jan. 1264). Henry went in person to Amiens to attend the arbitration; but an accident prevented Simon de Montfort from doing the same. Louis had his idea of the dignity of royalty and was too scrupulous not to credit another king with a desire of doing his duty. He, therefore, decided all points in favor of Henry and annulled the Provisions of Oxford and all engagements founded

upon them, leaving Henry a free hand to appoint his ministers and to enjoy his royal power as fully as he had done before the enactment of the Provisions of Oxford. See MONTFORT, SIMON DE; HENRY III; BARONS' WAR.

MISE OF LEWES, *lū's*, a treaty made by Henry III after the battle of Lewes (14 May 1264), where he was defeated and captured by the Barons under Simon de Montfort. The Mise of Lewes contained seven articles. By the first and second, after a reconfirmation of the Provisions, a new body of arbitrators was named—the archbishop of Rouen, the bishop of London, Peter, the chamberlain of France, and the new legate the cardinal bishop of Sabina, with the Duke of Burgundy or Count of Anjou as umpire when necessary; the third directs that the arbitrators shall swear to choose only English counsellors; by the fourth the king is bound to act on the advice of his counsellor in administering justice and choosing ministers, to observe the charters and to live at moderate expense; by the fifth Edward and his cousin Henry are given as hostages; by the sixth is provided the indemnity of the earls of Leicester and Gloucester, and the seventh fixes the next Easter as the time for the completion of the compromise. Peace was declared on 25 May and published at London on the 11th of June. See HENRY III; MONTFORT, SIMON DE; BARONS' WAR.

MISENO, *mē-sā'nō*, **Cape**, Italy, a promontory forming the west side of the Bay of Pozzuoli (ancient Cumæ), 10 miles southwest of Naples. On it are the ruins of the ancient city of Misenum, destroyed by the Saracens, 890 A.D., which Augustus made one of the principal naval stations of the Romans.

MISERABLES, *Les*, *lā mē'zā'ra'bl*, by Victor Hugo, is by universal consent one of the great novels of the world. Heralded since 1854 as designed to be a sort of social gospel, written almost wholly in exile by one whose political intransigence had attracted general regard, the work, extending to 10 volumes, appeared simultaneously in as many languages (3 April to 30 June 1862) and has since been in constant and wide circulation in many lands. It was Hugo's first novel since 'Notre-Dame,' 31 years before. That had been an evocation of the past. Here his eyes were on the present, his heart in the future. To profound compassion for the sufferings of the unfortunate he joined a sturdy faith in the possibilities of moral regeneration and social reform through a realizing sense of human brotherhood. "So long," he says, in a preface, "as there shall exist, through the fault of our laws and customs, a social condemnation that creates artificial hells in the midst of our civilization and complicates a divine destiny by human fatalism; so long as the three problems of the century,—the degradation of man by the proletariat, the fall of woman by hunger, the arrested development of the child by ignorance,—are not solved; so long as social asphyxia is possible in any place—in other words and in a wider aspect, so long as there shall be on earth ignorance and misery, books like this cannot be useless." The first of the three problems is here impersonated in Jean Valjean.

the second in Fantine, the third in her unfathered daughter, Cosette.

In structure *Les Misérables* is loose-jointed, discursive, straying too readily into by-paths of antiquarian lore, political reminiscence, philological speculation, scientific conjecture, sociological visions. Hugo is apt to proclaim some commonplace with oratorical emphasis, as though it were a revelation of social salvation. He is apt to overcharge his characters until they become hardly human embodiments of some abstract quality, it may be mercy and forgiveness as in Bishop Myriel, untempered social justice as in Javert, political intransigence as in Enjolras, unmitigated cunning and cruel greed as in Thérnardier. But through all there is a sincere and intense if vague emotion, a deep pulsing sympathy, a splendid indignation at the ignoble and base degradations of outworn institutions and conventions, an unfailing force of moral conviction, a glowing eloquence, that make it easy to pass by, if not to forget, the occasional cyclopean lack of humor and the passages of puerile insipidity that are in strange contrast to others of impassioned and beautiful lyric appeal.

Hugo is a social optimist, often grand, never petty, though sometimes grandiose. Its foibles apart, *Les Misérables* is a noble plea for more practical recognition of the brotherhood of man, for more charity in judging the tempted, the wretched and the fallen. Jean Valjean, whose struggle for social reintegration is the connecting thread of the 10 volumes, is a discharged convict contending against social and legal proscriptions that must have driven him back to the galleys whence he came, had not Bishop Myriel redeemed him with the gift of the silver which he had stolen. He makes himself respected and beloved. But a petty theft remains unexpiated, and rather than see another suffer on account of it he surrenders himself again to prison. But first he lightens the last hours of Fantine, once a symbol of joy, "innocence floating on error," now the dying mother of Cosette, whom she has in desperation consigned to the mercies of Thérnardier and now commits to the heart of Valjean. Here ends *Fantine*, the first of the novel's five parts, to be remembered especially for Bishop Myriel, said to be essentially Monsignor de Miollis, a former bishop of Digne. The second part, *Cosette*, opens with a justly famed picture of Waterloo, whence the scoundrel camp-follower Thérnardier, a plunderer of corpses, had saved for his own base ends Colonel Pontmercy, father of Marius, the romantically predestined husband of Cosette, and apparently reminiscent of Hugo's own. Then it tells of Valjean's life in the galleys and of his escape, how he was pursued by justice incarnate in Javert, how he rescued Cosette from Thérnardier and himself found refuge as a convent gardener, with reminiscences of Hugo's own childhood at Les Feuillantines. *Marius*, the third part, is concerned mainly with the restless political agitation among those dissatisfied with the results of the revolution of 1830. Marius is what Hugo thought he himself might have been. The charm of this part is in the very genial account of the Parisian *gamin*, Gavroche. Part 4, *Saint Denis*, has a brilliant account of the great barricade and riot of June 5, 1832, with the touching death of Gavroche and the first buddings of the love of Marius and Cosette. *Jean Valjean*, the fifth part, is especially notable for its account of the rescue

of the wounded Marius by Valjean and their passage through the sewers, of the despairing suicide of the baffled Javert, of Thérnardier's unintentional enlightenment of Marius as to his real debt to Valjean and for the very beautiful picture of the redeemed convict's august end.

Les Misérables has been abridged by O. B. Super (Boston 1903), and well translated by C. E. Wilbour, (*Everyman's Library*, 1909) and others.

MISERERE, mīz-ě-rě'rě; -rā', (Latin, "have mercy"), the name (taken from its first word) by which the 50th Psalm in the Vulgate (or Latin version) is known, corresponding to the 51st of the authorized version. It is the fourth of the seven Penitential Psalms. The *Miserere* forms part of certain liturgies, and various great composers have taken it as a subject. The *Miserere* of Gregorio Allegri is particularly famous.

The name *Miserere* is also given to a projection on the underside of the seats of the stalls of mediaeval churches and chapels. They are usually ornamented with carved work, and are so shaped that when the seats proper are folded up they afford a small seat at a higher level sufficient to afford some support to a person resting upon it, and were thus used by priests suffering from bodily infirmity.

MISERICORD, mīz-ěr-ī-kōrd', a narrow-bladed Italian dagger used in giving the *coup de grâce* or finishing stroke to a wounded foe. Also the name of a society in Florence, founded in the 13th century, who tend the poor sick, carry victims of accidents or disease to the hospitals, and the dead to their burial.

MISFEASANCE, mīs-fě'zāns, from the French *méfaire*, to do wrong signifies the doing of a lawful act in a negligent, or improper, manner. Misfeasance is, in some cases, punishable by law. It should be contrasted with malfeasance, the doing of a wrongful act, and non-feasance, the failure to perform a promised act.

MISFORTUNES OF ELPHIN, *The*, a humorous novel by Thomas Love Peacock (q.v.) published in 1829. A parody of the Arthurian legends, it tells how King Elphin of Caredigior in Wales loses most of his realm, flooded by the sea, how he is imprisoned by a neighbor and rescued by Taliesin, a young bard who enlists King Arthur's help by restoring to him Queen Guinevere, abducted by King Melvas.

MISHAWAKA, mīsh-ā-wō'kà, city, Ind., in St. Joseph County, altitude 720 feet, 4 miles east of South Bend, and 104 miles east of Chicago, by rail; at the head of navigation on the St. Joseph River; on the Grand Trunk and the New York Central railroad lines; has an airport. In the surrounding country corn, wheat, oats, and rye are grown. Water power generated by means of dams in the river above the city has been used in the local industries, products of which are rubber footwear, raincoats, upholstery, furniture, trunks, aluminum articles, beer, steel and wooden pulleys, drop forgings, and brass castings. Mishawaka has a public library; 12 elementary public schools, one high school, and three parochial schools; six parks and three playgrounds. There was a settlement on this site as early as

1828. Early in the 1930's St. Joseph Iron Works was established on the south side of the river, and a year or two later Indiana City was laid out on the other side. In 1839 the two villages were combined and incorporated as the town of Mishawaka. Incorporation as a city was effected in 1899. The name comes from an Indian village that occupied the site before the white men settled there. Government is administered by mayor and council. Water supply, light, and power systems are municipally owned. Pop. (1940) 28,298; (1950) 32,913.

MISHNA, mīsh'nà, the first part or text of the Talmud, the second part or Gamara (supplement) consisting of a commentary on or elucidation of the Mishna, which consists of oral traditions and glosses on the Pentateuch, made in Galilee by the Rabbi Jehudah or Judah Hakkolesh, who completed the work 220 A.D. A commentary was rendered necessary by the extreme terseness and conciseness of style with which the Mishna is composed. It is written in Hebrew, but it contains a number of Greek, Latin and Aramaic words, which had become naturalized in the Hebrew, and bears traces also of Aramaic idiom. The traditions set down in the Mishna were held by the Pharisees to be of equal authority with the written law of Moses, and were supposed to constitute an oral law delivered to Moses by God and by Moses delivered to Joshua, or Joshua to the elders, by the elders to the prophets and by the prophets to the men of the Great Synagogue. Such is the statement of the Mishna itself, which the Pharisees accepted. The Sadducees, however, rejected this doctrine, although in many cases they followed in practice "the traditions of the elders" with much fidelity. See also JEWISH HISTORY AND SOCIETY—*The World of the Talmud*.

MISIONES, mē-syō'nās, national territory, Argentina, between the Uruguay River on the southeast and the Paraná on the west, and the Guassú on the north; area 11,506 square miles. Three low mountain chains radiate from the center, and the greater portion of the surface is covered with forest, producing building and dye-woods, oranges, medicinal herbs and the *yerba naté* or Paraguay tea. The country is well watered and fertile, and there are valuable granite quarries. The Iguassú Falls, 196 to 200 feet in height on the Brazilian line attract many tourists. Maize is largely grown and sugar cane to some extent, and several sugar mills are in operation. There are interesting and other ecclesiastical remains of the early Jesuit missions. Posadas, the capital, on the Paraná, was founded in 1865. Pop. (1947) 246,396.

MISKOLC, mīsh'kōlts, city, Hungary, 84 miles northeast of Budapest, on the Sajó River, at the foot of the Bükk Mountains. It has excellent rail and air service. Second in industrial importance to Budapest, it carries on a large trade in wine, tobacco, cereals, and flour. Other manufactures are varied. They include textiles, food products, furniture, shoes, paper, flour, lumber, soap, and bricks. Extensive lignite mining is carried on in the vicinity.

The city has several beautiful Gothic churches, a law school, and a conservatory of music. On Mt. Avar, nearby, are the state-owned vineyards. There are warm springs and baths at Tapolcza

about 4 miles southwest of the city. Pop. (1941) 77,362.

MISNOMER mīs-nō'mēr, (from the French *ménomer*, misnaming) an error in naming a person in a pleading, deed or other written instrument.

MISPICKEL. See ARSENOPYRITE.

MISPRISION, mīs-prīzh'ūn, (1) the concealment of a crime, as felony or treason; called also *negative misprision*. (2) High misdemeanor or contempt, as maladministration by a public official or inducing a witness to refuse to testify; called also *positive misprision*. Misprision of felony is still punishable in the English law, but is practically obsolete elsewhere. Misprision of treason was formerly punished in England by forfeiture of goods and imprisonment for life, but today the maximum penalty is penal servitude for life. In the United States it is a federal offense, punishable by imprisonment.

MISREPRESENTATION, in law, any act, whether verbal or tacit, tending to create or creating a false impression on another, such that by acting upon this impression he is injured. Misrepresentation falls under two heads, deliberate and unwitting. Deliberate misrepresentation is either deceit or fraud. Unwitting misrepresentation is legal mistake, and its treatment by the law depends largely on circumstances, but is unfortunately too much influenced by the principle that "ignorance does not excuse," which should strictly be confined to the application suggested by its original form, "ignorance of the law."

MISRULE, Lord of, a whimsical title given to the leader of the Christmas revels in the Middle Ages. He is a descendant of the king of the ancient Roman Saturnalia who impersonated Saturn. His duties were to lead the multifarious revels of the season; or, in other words, to act as master of ceremonies. John Stow, English historian, in his *A Survey of London* . . . (1598-1603) gives the following account of him: "In the feast of Christmas there was in the kings' house, wheresoever he lodged a Lord of Misrule or Master of Merry Disports, and the like had ye in the house of every nobleman of honor or good worship. The mayor of London and the sheriffs had their several Lords of Misrule ever contending without quarrel or offence, who should make the rarest pastime to delight the beholders. These lords beginning their rule at Allhallows Eve continued the same till the morrow after Candlemas Day, in which space there were fine and subtle disguisings, masks and mummeries, with playing at cards for counters in every house, more for pastimes than for gain."

In the University of Cambridge the functions of the Lord of Misrule were performed by one of the masters of arts who was regularly elected to superintend the annual reproduction of Latin plays by the students besides taking a general charge of their games and diversions during the Christmas season, and was styled the Imperator, or Praefectus Ludorum. A similar Master of Revels was chosen at Oxford. It seems to have been in the Inns of Court in London that the Lord of Misrule reigned with the greatest splendor, being surrounded with all the parade and cere-

mony of royalty, having his lord-keeper and treasurer, his guard of honor, and even his two chaplains, who preached before him on Sunday in the Temple church. On Twelfth Day he abdicated his sovereignty. In the year 1635 this mock representative of royalty expended in the exercise of his office about £2,000 from his own purse; and, at the end of his reign, he was knighted by Charles I at Whitehall. The office was regarded among the Templars as most honorable and was generally conferred on young gentlemen of good family. The Lord of Misrule was always costumed extravagantly and carried a fool's bauble as badge of office. A favorite form for his lordship to enter upon his duties was to absolve the company of all their wisdom, leaving them "just wise enough to make fools of themselves." Fealty was sworn to the merry monarch and the reign of fun and folly began.

In Scotland this character was called the Abbot of Unreason; in France, he was the Abbé de Liesse and Abbas Stultorum—the Abbot, or Pope of Fools. Scott gives a description of one of these mock-ecclesiastics in 'The Abbot.'

MISSAL (Latin *missale*, from *missa*, mass), the book which contains the prayers, rubrics, antiphons, etc., of the mass. It was formed by comprising in one volume the separate books formerly used in different parts of the service, namely the Oratorium, Lctionarium, Evangelium, Antiphonarium, the Canon, etc., for the convenience of the priest. Variations and corruptions in the course of time crept into the text of the Missal, and the Council of Trent suggested a revision of it. This was accordingly accomplished by order of Pius V (1570), who required the new Missal to be used by the whole Church, with the exception of those societies which for more than two centuries had followed another ritual. Subsequent revisions made under Pope Clement VIII (1604), Urban VIII (1634) and Leo XIII (1884, 1898) extended little beyond alterations of single expressions, and the addition of new masses, both obligatory and permissive, universal and local. In the ancient and mediæval Church there were missals in use, varying according to the various rites. Thus, in England, there were missals of the Sarum use, Hereford use, Lincoln use, Bangor use, etc. There are also missals of the Greek Church, the Church of the Maronites and other Christian bodies. The earliest printed missal is the 'Missale per totius Anni Circulum More Ambrosiano compositum' (Milan 1475, folio), which was followed by the 'Missale secundum Consuetudinem Romanæ Curie' (Rome 1475).

MISSI (Latin, meaning those sent), name given to officials sent on special errands by the Frankish kings. Their institution dates from Charles Martel and Pepin le bref; but Charlemagne made them a regular part of his administration. Under Charlemagne the *missi dominici* were most important. Into each district of the great empire were sent each year two *missi*: one a lay nobleman and the other an officer of the Church. It was their business to hold court, hear complaints, redress grievances and report all this to the emperor. By this means Charlemagne controlled the courts and centralized the government. The *missi*

dominici disappeared from France and Germany in the 9th century and from Italy in the 10th century. Consult Thompson, J. W., 'Decline of the Missi Dominici in Frankish Gaul' (Chicago 1903).

MISSING LINK, a term used to designate the gap in the scheme of evolution between the ape and man. See APE; EVOLUTION; DARWIN; PITHECANTHROPUS ERECTUS.

MISSION INDIANS, a general name given the Indians of southern California who in the 18th century were Christianized by the Spanish Franciscan missionaries. The Mission Indians were originally of many tribal families and dialects, but chief among them were the Yumas and the Shoshones. Father Junipero Serra (q.v.) and the other friars who followed him succeeded in gathering the Indians into communities, mission houses and chapels were built and vineyards planted. The work began about 1776 and continued successfully until 1831. In this latter year they numbered 19,000, but with the overthrow of the Spanish power by the Mexicans a period of confiscation and destruction began, which continued to 1840. The friars were banished, the mission abandoned and the Indians driven back to the deserts and the mountains. Under the American rule in California, both Indians and missions were neglected until after the Civil War, when, principally at the instigation of Helen Hunt Jackson (q.v.), the government took steps to care for the unfortunate natives. They now occupy about 30 small reservations, which in the aggregate contain 180,000 acres. The remaining Indians number about 2,600. They are partly civilized and fairly industrious. Within recent years an organization in Los Angeles has endeavored to rebuild the ruined missions and preserve them in remembrance of the historic past. (See PIOUS FUND). Consult Englehart, Z., 'Missions and Missionaries of California' (San Francisco 1908); Wetmore, C. A., 'Mission Indians of Southern California' (Washington 1895).

MISSIONS, Protestant Foreign. Foreign missions were not seriously undertaken by Protestants until more than 200 years after the Reformation. This curious fact is sufficiently explained by the circumstances that the reformers were involved at the outset in a struggle not only for liberty but for life itself; that Christendom did not yet control the whole of Europe; an aggressive Mohammedan power with its foot in Hungary and its fleets in the Mediterranean being still active in its purpose of conquest; and that the state alone commanded resources sufficient for enterprises of any kind in remote regions like the Indies, Africa or America. These circumstances of life in Europe in the 16th century materially lessen the importance of the question whether Luther and his followers did or did not see that a Christian Church must die which is not actively missionary in principle.

The first Protestant missions, perhaps naturally, were state enterprises, unless we reckon as a mission the single effort of Heiling (1634) in Abyssinia, which ended with his murder 20 years later. In 1556 the Council of Geneva sent missionaries to Brazil with Coligny's colony, who perished with the colonists. In 1635 the Duke of Gotha sent a mission to Persia, and in 1663 again a mission to Abyssinia; both impractical embassies were quickly forgotten. The Dutch government, after gaining possession of the East Indian Archipelago in 1602, made a serious effort to Christianize the Malays, and the people of Ceylon and of Formosa, producing permanent results in Java and the adjacent islands of the East Indian Archipelago only. The Dutch government published in 1685 the New Testament in Malay (the second of modern translations of Scripture into heathen languages; Eliot's translation into Mohican in 1663 having been the first), and the whole Bible in 1701. It has also maintained a Malay Protestant Church in Java, the Moluccas and Celebes, which now has about 400 ministers and 250,000 adherents, of whom probably one-half are descendants of the 17th century converts. A similar state missionary enterprise undertaken by a Protestant government of Europe was the Danish mission to South India, founded by King Frederick IV of Denmark in 1706. The king sent out as the first missionaries to Tranquebar, Ziegenbalg and Plutschau, Germans from Francke's school at Halle. Other Germans from the same surroundings followed, notably Schultze and his later associate, Schwartz, making this Danish mission the first serious Protestant mission in India. Ziegenbalg translated the New Testament into Tamil (the third of modern translations of Scripture into heathen language), and before the end of the century from 30,000 to 50,000 Tamils had become Christians.

Another mission maintained by Frederick IV of Denmark was that commenced by Hans Egede in Greenland in 1721, and later transferred to the care of the Danish Missionary Society. This mission Christianized the whole Eskimo population in the vicinity of the Danish trading stations.

The British government showed a similar sense of responsibility for missionary work in its colonies, and the duty of preaching to the North American Indians was laid down in the charters of Virginia (1584) and Massachusetts (1628). Parliament even went so far as to consider in 1648 the endowment of a state foreign missionary enterprise. It voted a grant in aid of the "Society for the Propagation of the Gospel in New England," formed in 1649 and still existing under the name of the New England Company, which educates Indians in Canada with the revenues of the ancient government grant. John Eliot of Roxbury, Thomas Mayhew of Martha's Vineyard, and others through this government solicitude received state support in their missionary work for Indians. The British East India Company, moreover, was required by its charter in 1698 to maintain chaplains at its stations, and to instruct its Hindu servants in Christian doctrine.

All of these state enterprises in the line of foreign Protestant missions were uncertain in method and precarious in stability. They served, at least, to show the possibility of prosecuting missions in the colonies, but were sufficiently

barren to suggest the formation of those voluntary societies for missionary effort which proved to be the effective form in which the missionary idea among Protestants was to express itself.

Unsatisfactory religious conditions in the East India Company's trading posts led in 1698 to the organization of the "Society for the Promotion of Christian Knowledge," with the purpose of providing books and schools for neglected English communities, and in 1701 to the appearance of the "Society for the Propagation of the Gospel in Foreign Parts," intended to provide for the religious culture of Englishmen residing in foreign lands. Both of these societies were directed by the Church of England, although voluntary in form and in the sources of their revenues. Neither of them were foreign missionary societies. But the first now publishes books in Oriental languages, and it saved the Danish Mission in South India from dying with its royal founder, and supported it during a century, until it was taken over by the Society for the Propagation of the Gospel. This latter society, too, has gradually taken up the work of evangelizing pagans until it has over 1,000 missionaries in India, China, Japan, Korea, Malaysia, Africa and the West Indies, with nearly 3,500 native clergy and laymen in the various departments of its work. These two societies then, founded about the beginning of the 18th century, may be considered as the pioneers of the voluntary foreign missionary societies of Protestant Christendom.

It was not until the 19th century was about to dawn, however, that a general movement toward missionary enterprises began among Protestants in Europe and America. This movement grew out of that revival of personal religion in the 18th century which was fostered by the writings of Spencer and Francke, the Pietists of Halle, and by the devoted lives of men like David Brainerd of Connecticut, and Zinzendorf, the patron and leader of the Moravians, and was stimulated by the exhortations of Whitefield, the Wesleys and Jonathan Edwards, and by the example of the "Unity of Brethren" (*Unitas Fratrum* or *Brüder Unität*) as the Moravians call themselves. The Moravians, not as a church that begs men to volunteer, but as a community in which every member has equal interest in evangelism, were the first decided champions of Protestant missions. They held it the duty of all Christians to tell men what benefits they had received from Jesus Christ. They established missions between 1732 and 1770 in the West Indies, in Greenland, in the Indian settlements of North America, among the Hottentots of South Africa, and in Labrador. They now support 306 congregations with 36,242 communicants and teachers in their various mission fields which include, besides those already named, Alaska, Australia and the border lands of Tibet. The English Wesleyans should also be reckoned with the Moravians as having taken up missions in advance of the general movement of the Protestant churches. They did not formally organize the Wesleyan Methodist Missionary Society until 1814. But in 1779 they employed missionaries among the North American Indians, and in 1786 they began an important work among the slaves of the West Indies. The Society has over 835 missionaries, and

thousands of native workers and teachers in India, Ceylon, South Africa, China, Polynesia and the West Indies.

Before this extension of Wesleyan missions took place a surprising outburst of zeal for the missionary idea appeared almost simultaneously in England, in the United States and on the Continent of Europe. It was a revolution, since formalism had made the Protestant churches almost forget that to be a Christian means to be always in some sense a missionary. The characteristic feature of the movement was its origin in the conscientious convictions of isolated individuals, from whom the church did not expect initiative and whom it sometimes regarded as unsteady enthusiasts. William Carey, a cobbler and a Baptist minister in England, made the first move in 1786 and was frowned down by his elders. But in 1792 his earnest conviction carried the day; 12 men united to form the Baptist Missionary Society (England), and Carey and Thomas went to India as its first missionaries. There is no space here to describe the marvelous activities of Carey and his associates Marshman, Ward and others, at the Danish trading post of Serampur near Calcutta, where they were given asylum when the East India Company refused to tolerate their presence in its territories. The great school buildings which these missionaries erected at Serampur stands today, and their press added to the then slender stock of Bible translations passably good versions of Scripture in 34 Oriental languages and dialects. The Baptist Missionary Society has 480 missionaries and about 2,000 native preachers and teachers in India, Ceylon, China, Africa and the West Indies.

This example was contagious. In 1795 The Missionary Society was formed in London by the union of notable men of four different denominations. Its name was afterward changed to The London Missionary Society. It is now substantially composed of Independents (Congregationalists) alone, and has 480 missionaries and 7,000 native preachers and teachers, in Polynesia, New Guinea, Madagascar, Africa, India and China. In 1796 two similar societies were formed in Scotland which at first aided the London society, but later took up independent work in the West Indies and in South Africa, and finally (1824) became merged in the Church of Scotland Foreign Missionary Committee, of which a later (1843) offshoot was what has now become the Foreign Missionary Society of the United Free Church of Scotland. The Church of Scotland Foreign Missionary Committee now has 120 missionaries and 1,200 native workers, and the United Free Church has 541 missionaries and 5,093 native preachers and teachers in India, China, Africa, Arabia, and New Hebrides, Manchuria and the West Indies. The same impulse led in 1797 to the formation in Holland of the Netherlands Missionary Society. This was first an auxiliary of the London Missionary Society but soon undertook independent work. At present it has over 60 missionaries and 154 native workers in the Dutch East Indies.

The same conviction of responsibility together with realization of the extent and condition of the heathen world led in 1797 to the organization in London of 26 men belonging to the Church of England as the Society for

Missions to Africa and the East. This name later gave place to the familiar one of the Church Missionary Society. Among its founders were William Wilberforce, Henry Venn and Charles Simeon; but the Church of England gave the society no encouragement until the successes of nearly 50 years compelled recognition. Hence the first missionaries of this society were commonly Germans; for the most part men of the highest ability and attainments. The fields of the Church Missionary Society are India, Ceylon, China, Japan, Africa, Mauritius, New Zealand, Persia, Palestine, Egypt, the Sudan and the Arctic regions of British North America. It has about 1,500 missionaries and over 11,000 native preachers and teachers.

Missionary enterprises next began to spring up in Germany and in America. The marked characteristic of the movement in every case was the same profound conviction of individuals, commonly not officials of the churches to which they belonged. Five students of Williams College in Massachusetts furnished the initiative that resulted in the organization of the American Board of Commissioners for Foreign Missions in 1810. This was at first an interdenominational society. Its first missionaries, Newell, Judson, Hall, Rice and Nott, were sent to India and were ordered out of the country by the East India Company the moment they landed. Judson and Rice took refuge with the English Baptists at Serampur, while the others succeeded in effecting a lodgment at Bombay and in Ceylon. The fields of this society include India, China, Japan, Ceylon, Africa, the Balkan States, Turkey, Austria, Spain, Mexico, the Philippines and Micronesia. Its missionaries number over 650 and its native laborers 5,000. After 40 years of existence as an interdenominational society, it handed over its missions in Persia, Syria and the Gabun region of West Africa to the Presbyterians, and part of its field in South India to the American Reformed (Dutch) Church, and has become substantially a Congregationalist body. Judson and Rice of the earliest missionaries of this society decided on arriving in India that they would prefer to serve under a Baptist organization and this decision led to the formation in 1814 of what is now the American Baptist Foreign Mission Society of Boston. Burma was the field selected for its first efforts and the heroic work of Adoniram Judson in that land made his name great among modern Protestant missionaries. The society has about 700 missionaries and 8,600 native laborers in Burma, Siam, Assam, India, China, Japan, the Philippines and Africa.

Meantime, in Germany, Jannicke of Berlin, whose brother was a missionary of the Danish Halle band in South India, opened a Missionary Training School at Berlin in 1800. This school during the next 25 years furnished about 80 missionaries to the service of the English and Dutch societies, and served to arouse interest in missions among the Germans. Its influence led in 1815 to the establishment of Missionary Training Institute at Basel in German Switzerland. The latter institute furnished many admirable men to the service of other societies and in 1822 began to send out missionaries of its own. The fields of the Basel Missionary Society are in India, China and Africa.

and graduates of its institute are pastors of Protestant churches in Turkey. At present it has in the field about 475 missionaries and 624 native workers.

In 1824 10 strong men in the Lutheran Church, among whom were Neander and Tholuck, formed the Berlin Missionary Society; beginning operations, according to the wise continental practice, by opening a training school for missionaries. It began to send out missionaries in 1834 and now carries on missions in Africa and China. It has in the field about 150 missionaries (wives of missionaries not counted) and 1,000 native preachers and teachers. Other missionary societies sprang up in Germany during the first quarter of the 19th century. Of these the Rhenish Missionary Society is perhaps the largest. Its fields were in South Africa, China, Sumatra, Borneo and New Guinea. It has 382 missionaries and 1,340 native laborers. There are a score, at least, of other German missionary societies of which the chief are the Gossner Society, the Hermannsburg, the Leipzig, the North German and the Breklum societies, working in the Dutch East Indies, Africa, India, China, Australia and Turkey.

The same period saw the formation in France of the Paris Evangelical Missionary Society (1824), designed at first merely to aid existing enterprises, but quickly beginning to send out missionaries of its own. At present it has 170 missionaries, men and women, and 1,274 native workers, in Madagascar, Senegambia and the Barotsse and Basuto regions of Africa. With the development of French colonial expansion it has also taken the place of the London Missionary Society's missionaries in Tahiti and in parts of Madagascar, and of American missionaries in the French Kongo region. Protestant missionary societies in Holland, Denmark, Sweden, Norway and Finland sprang later from the same causes and are doing good work with 831 missionaries and about 4,000 native workers in Africa, India, China, Chinese Turkestan and Madagascar.

The same spiritual awakening of widespread effects gave rise also to the British and Foreign Bible Society (1804), the American Bible Society (1816), the Netherlands Bible Society, and Religious Tract Society of London (1799) and the American Tract Society of New York (1820). The Bible societies do true foreign missionary work in publishing the Scriptures as soon as missionaries have translated them into the languages of non-Christian peoples and in disseminating the Scriptures in these languages. Some 500 modern translations have been published. The British and Foreign Bible Society employs about 2,000 colporteurs and Bible women and its total issues of Bibles, New Testaments and lesser parts of Scripture amounted to over 11,000,000 copies. The American Bible Society has about 3,582 workers in foreign mission fields and issued in 1925 9,214,423 copies. The Scottish National Bible Society issued in the same year over 2,000,000 copies, besides joining with the first named societies in providing finances for translating and publishing the Bible in various languages.

The tract societies aid missions in a similar manner; providing funds for the publication of denominational Christian literature in the languages of non-Christian peoples. The Re-

ligious Tract Society of London at its centennial anniversary was able to report that it had given for this purpose to English and American foreign missions aid equivalent to \$100 per day during the whole period of its existence.

In the second quarter of the 19th century the American Methodist Episcopal Church and the American Presbyterian Church began their missionary work in foreign lands. The two great branches of the Methodist Episcopal Church now have 1,027 missionaries and 8,561 native laborers. The Presbyterians North and South have 1,579 missionaries and 6,866 native laborers. Almost all denominations in the United States and in Great Britain now have foreign missionary organizations of their own. Interdenominational and international missionary societies, like the China Inland Mission, the North Africa Mission, the Christian and Missionary Alliance and other bodies of greater or less importance have been formed to carry on missionary enterprises by methods more free from machinery than the older societies sometimes seem to require. The total number of Protestant missionary societies now existing probably exceeds 500. The World War interfered with collection of statistics, but it is safe to assert these societies have 24,000 missionaries, men and women, and about 110,000 native workers.

Four points are noteworthy, in the history of the development of these missionary societies, as each marking an epoch of expansion of their scope. These are: (1) The adoption of education as a missionary agency; (2) the general adoption by women of mission work for woman-kind; (3) the establishment of medical missions; (4) the opening of industrial departments in many missions.

1. Education.—The aim of foreign missions is to tell of Jesus Christ to those who do not know Him. The aim is to lead them to surrender self-will to the control of Jesus Christ so completely that converts shall be true Christians, who, if the missionary leaves to-morrow, will stand immovable in their devotion and their impulse to teach others the truth that has benefited themselves. At the outset the task seemed simple enough. To preach and preach again was all that was necessary. As a result of the first half century of experience, the discovery was made that common schools are essential in all missions which urge the reading of the Bible. Rev. Dr. Alexander Duff, a missionary from Scotland who left ineffaceable marks upon India, was a leader in championing the thesis that education in all grades is also an essential department of missionary effort. This principle is now established with all that it means of general enlightenment for backward races, and at present there are in the Protestant missions throughout the world 35,000 educational establishments of all grades from kindergarten to university, attended by about 1,670,000 young people of every form of religious belief.

2. Woman's Work.—As early as 1825 missionaries undertook the education of girls in India, Africa, Turkey and elsewhere. In 1835 a Woman's Missionary Society was formed at Berlin, Germany, for the instruction of women in the East; and later schools for girls were opened in several non-Christian lands by different missionary societies. It was not until 1860 that the women of Christian lands began

to take the matter into their own hands. Beginning with the Woman's Union Missionary Society of New York (1860), mission boards of women were organized in almost all the Protestant denominations of Great Britain, Canada and the United States. These missionary societies of women are for the most part closely allied to the general missionary boards of the denominations to which they belong, but they send out women as missionaries and have produced vast extension of the scope of the missionary enterprise. The impossibility of carrying on successful missions without women missionaries to win and instruct their own sex is now fully recognized. There are thousands of unmarried women working as missionaries in all parts of the non-Christian world. No mission field is so dangerous or so repellent in its barbarism as to be denied the ministering service of devoted women of Christendom.

3. Medical Missions.—At the outset physicians were sent to the missions with the primary duty of caring for the health of missionaries. They could not, however, fail to use their knowledge for the relief of suffering in lands where surgery was unknown and the science of medicine parodied. It was not until about 1885 that the Medical Mission was fairly established as a recognized channel of missionary influence. Since that time the number of missionary physicians, both men and women, and of missionary hospitals and dispensaries has increased every year. At present there are over 800 men and women physicians and surgeons, with 1,638 hospitals and dispensaries in connection with foreign mission fields.

4. Results of Foreign Missions.—It used to be common for critics of missions to picture bewilderment among pagan hearers as a necessary result of denominational differences among missionary preachers. But the gospel preached to pagans by Protestant missionaries of different denominations is one in essence, and the problems of missionary effort in all fields are much alike. Sixty years ago missionaries of different denominations at work in India conferred together on the more efficient prosecution of the common work. The advantage of such conferences was so clear that the solidarity of the different missions may be set down as one result of the missionary enterprise. Conferences between the different missions are now held regularly in many foreign lands. Moreover general conferences of the societies of different nations have been held with notable advantage to the cause of missions. Such was the Conference of London in 1888, the Ecumenical Conference on Foreign Missions held in New York in 1900 and the World Foreign Missions Conference of Edinburgh in 1910. The Latin America Mission Conference of 1916 was a gathering of the same nature which brought together at Panama almost 500 missionaries and friends of missions from 21 nations. An annual assembly of the same class is the Foreign Missions Conference of the United States and Canada which brings together representatives of more than 40 missionary societies. Similar annual conferences are held in Great Britain and in Germany. Fruits of such gatherings are increase of sympathy and comity and diminution of possible causes of friction between different denominations and a steady advance in efficiency and economy on the foreign field. At

home this unification of missionary interest has produced such interdenominational enterprises for the support of foreign missions as the Missionary Education Movement, the Student Volunteer Movement and the Laymen's Missionary Movement.

At present the stations of foreign missionaries number about 12,000 besides about 38,000 other places more or less regularly visited. The organized congregations are about 15,400. In connection with these congregations the number of persons in full church membership is nearly 3,000,000. Figures are proverbially uncertain agents for setting forth facts and their meaning. In any general statement such as is here attempted it should be remembered that before statistics can be gathered from the wide areas concerned many of the details will not be up to date. One thing that should be clear to the reader of this article, however, is the widening of the scope of foreign missions since the first fruition of the missionary idea in the modern Christian Church. This expansion of the scope of missions is not due to any modification of their fundamental purpose. It is due to experience of the needs of non-Christian peoples and especially of their need of a future nurture similar to that enjoyed by Christians at home. Let no one forget that no miraculous short cut exists by which a pagan savage can be transformed into a Christian gentleman of culture. The planting of the aspiration is a miracle, but a majority of converts remain children in development. Some may use this fact to belittle the moral change seen in multitudes. The number of converts who do become leaders in the mission churches is not thus to be set aside. Men from the lowest classes have risen through devotion to Jesus Christ to the highest ability, like the slave-boy Crowther of Yorubaland and Constantian of Turkey who became eminent among Bible translators; or like Abdul Masih and Imaduddin of India, whose work among their own people as Christian ministers was that of masters of apologetics; or like Dr. Saleeby of the Philippine Islands, once a village boy in Mount Lebanon, whose fitness for good service was grounded on the instruction received in American mission schools in Syria. The clean and kindly lives of converts in the mission fields, their sincerity and stability influence their people. Of the 150,000 persons received into Church membership in foreign missions annually, it is not rash to estimate one-half as having been won to a serious study of Christianity by the subtle influence of the lives of Christian acquaintances. Furthermore, the high qualities discovered in Christians often produce a gradual moral uplift among those who have not accepted the religious message of the missionary. It is a significant fact that the missionary societies have reported as income from the mission field in a given year \$7,902,256. This money came in part, from church collections, but also for non-Christian patrons of mission schools, and patients in mission hospitals. The Bible is widely circulated in mission fields. Some of the people decline to admit its authority as containing the principles of life on which must depend the stability of the universe; but they do regard it as a repository of experiences of men, wise and unwise, through many ages of time. These records sharply touch their own problems of life and

character. In 1915 a Chinese official, not a Christian, bought in Peking several thousand copies of the New Testament in Chinese which he gave to friends and subordinates as containing the noblest scheme of moral conduct which the world has ever known.
